Cover of rods at underside = 1½in.
Reinforcement = 3 rods ¾in. diameter.

The distance from the underside of the beam to the centre of gravity of the three rods will be 1½in. + ⅜in. = 1⅞in.

The effective depth of the beam will be 16in.—1⅞in. = 14⅛in.

The value of $b\,d = 14\frac{1}{8}\text{in.} \times 8\text{in.} = 113$ sq. in.

The area of one rod ¾in. diameter = 0.44 sq. in.

The total area of the tensile reinforcement $A_t = 0.44 \times 3 = 1.32$ sq. in.

Let p = the percentage of steel, then

$$\frac{1{\cdot}32 \text{ sq. in.}}{113 \text{ sq. in.}} = \frac{p}{100}$$

Multiplying both sides of this equation by 100, the hundreds on the right-hand side will cancel out, and we will get

$$\frac{100 \times 1{\cdot}32}{113} = p = 1{\cdot}17$$

That is, the percentage of steel to the area $b\,d = 1.17$ per cent.

Using the diagram for finding the position of the neutral axis. we find that

$$n = 0.44\text{d.}$$
$$= 0.44 \times 14.125$$
$$6.21\text{in.}$$

The area of concrete in compression (i.e., the area above the neutral axis)

$$= b\,n = 8\text{in.} \times 6.21\text{in.}$$
$$= 49.68\text{in.}$$

The stress at the compressed edge will be 600lb. per square inch.

The compressive stress at the neutral axis will be zero.

The mean stress will be $\frac{600 + 0}{2} = 300$lb. per square inch.

Expressing this in thousands of pounds, so as to reduce the number of figures, we can say that the mean stress per square inch will be $\frac{300}{1,000}$ or .3 thousands of pounds

The total compressive force above the neutral axis = .3 × 49.68 = 14.9 thousands of pounds (or 14.9 milals).

Now, the centre of pressure will not lie in the centre of the area above the neutral axis; it will be nearer to the compressed edge. Its calculated position is one-third of n from the compressed edge—that is to say, that the centre of compressive force is 6.21/3 = 2.07in. from the compressed edge of the beam.

The lever arm [or the arm of the couple formed by the compressive force above and the tensile force below] will be the distance between the centre of pressure and the centre of gravity of the tensile reinforcement.

That is $d - \frac{n}{3} = a$, where a is the arm of the couple.

In our case

$$a = 14.125 - \frac{6.21}{3}$$
$$= 14.125 - 2.07$$
$$= 12.055\text{in.}$$

The resistance moment in terms of the compressive force

= Compressive force × lever arm.
= 14.9 × 12.055in.
= 179.6 thousands of inch-pounds
= 179.6 milal inches.

Now this has been worked out fully, but by using our approximate rule we get

$$\left(\frac{90 + 20 \times 1.17}{1,100}\right) b\, d^2$$
$$= \left(\frac{90 + 23.4}{1,000}\right)\left(1,596\right)$$
$$= 181.1 \text{ thousands of inch-pounds.}$$

Comparing this result with the previous 179.6, it will be seen that this approximation is sufficiently accurate for all practical purposes, more especially having regard to the inevitable variability of concrete.

The resistance moment in terms of the tensile stress will be

$$A_t \,.\, t \,.\, a =$$
= 1.32 sq. in. 16.8 milals × 12.055 in.
= 270 thousands of inch-pounds nearly.

Thus the tensile resistance greatly exceeds the compressive resistance, as was to be expected.

These examples have been set out at at length only in order that the relative speed of the two methods may be contrasted and the results compared.

FUTURE SCHOOL BUILDING IN LONDON.

The Education Committee of the London County Council has prepared the following estimates of capital expenditure for the provision of schools for the financial year ending March 31st, 1911, and for the half-year ending September 30th, 1911.

PURPOSE.	Year ending 31st March, 1911. £	Half-Year ending 30th Sept., 1911. £
ELEMENTARY EDUCATION.		
No. 1—New Elementary Council Schools—		
(i.) Sites	71,000	25,700
(ii.) Buildings	132,665	68,500
(iii.) Equipment	5,000	3,835
	208,665	98,035
No. 2—Additions and alterations to Elementary Council Schools—		
(i.) Sites	56,000	800
(ii.) Buildings	46,340	9,000
(iii.) Equipment	1,835	70
	104,175	9,870
No. 3—Modernising and improving Elementary Council Schools—		
(i.) Sites	1,850	1,150
(ii.) Buildings	37,100	26,700
(iii.) Equipment	1,000	—
	39,950	27,850
No. 4—New Day Schools for the blind, deaf and defective—		
(i.) Sites	11,700	—
(ii.) Buildings	17,020	16,400
(iii.) Equipment	460	795
	29,180	17,195
No. 5—Additions and alterations to Day Schools for the blind, deaf, and defective—		
(i.) Sites	5 300	
No. 6—Industrial Schools—		
(i.) Sites	10,000	
Total—Elementary Education	397,270	152,950
HIGHER EDUCATION.		
No. 7—Secondary Schools—		
(i.) Sites	8,500	8,000
(ii.) Buildings	9,000	35,000
(iii.) Equipment	—	1,050
	17,500	44,050
No. 8—Training Colleges—		
(i.) Sites	3,000	—
(ii.) Buildings	4,100	6,300
(iii.) Equipment	80	400
	7,180	6,700
No. 9—Technical Institutes and Schools of Art—		
(i.) Sites	15,500	—
(ii.) Buildings	14,200	33,800
(iii.) Equipment	1,000	45
	30,700	33,845
No. 10—Grants in aid of Higher Education	29,500	5,000
Total—Higher Education	84,880	89,595
GENERAL.		
No. 11—Divisional Offices—		
(i.) Buildings	1,340	1,000
(ii.) Equipment	560	—
	1,900	1,000
No. 12—Places of detention—		
(i.) Liabilities in connection with buildings transferred from Metropolitan Asylums Board..	7,630	—
No. 13—General Provision—		
(i.) Sites	40,000	15,500
(ii.) Buildings	5,000	6,000
	45,000	21,500
No. 14—Sites to be acquired under the London County Council Provisional Order (Sites for Educational Purposes), 1910 (if confirmed)	11,900	8,450
Total—General	66,430	30,950
Grand Total	548,580	273,495

The Committee state that the average cost of a new school place is generally put at £20 for building and 11s. for equipment. The average cost per place for sites has been taken as £10 in the past, but there is a considerable variation in different districts. In the present estimates each case is dealt with on its merits. The Buildings Sub-committee have also put forward an estimate of expenditure on maintenance, etc., for the year ending March 31st, 1911, of £691,715, made up as follows:—Painting and cleaning, £68,955; repairs to buildings, £62,625; building and equipment not chargeable to capital, etc., £84,180; schoolkeepers and cleaning, £110,880; fuel, £44,000; gas and electricity, £36,000; water, £20,500; cleaning, warming, and lighting of non-provided schools, £43,440; rent of buildings, £9,055; rates and taxes, £207,385; and insurance, £4,695.

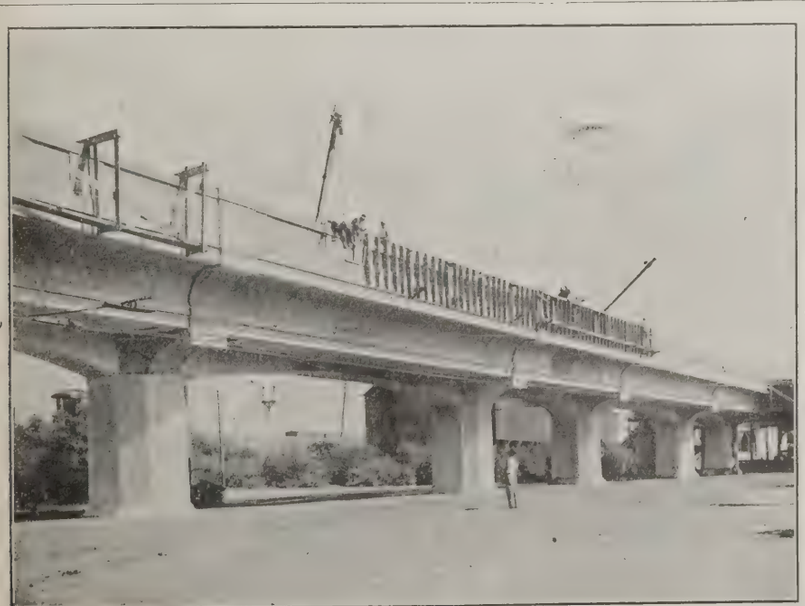

Photo: Topical.

FIRST REINFORCED CONCRETE VIADUCT ON THE BOSTON, MASS., ELEVATED RAILWAY.

Buildings in Progress and Completed.

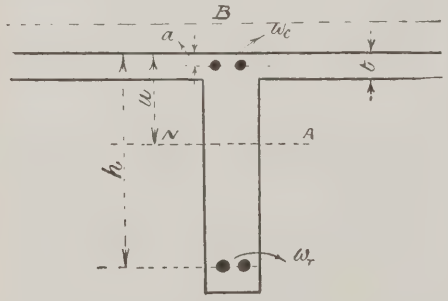
BIRNIE.—The new public hall has just been completed and opened. Mr. A. Morrison, Hillhead, is the architect.

BOURNEMOUTH.—The memorial stone of the new mission buildings in connection with St. John's Church, Boscombe, to be erected at a cost of about £6,000 has been laid.

BOURNVILLE.—The foundation stone of a new infants' school at Bournville has been laid. The building has been designed to accommodate 290 children.

BURY ST. EDMUNDS.—The new sanitorium has been opened for the reception of persons suffering from consumption. The site is situated at the corner of Rougham Road and Shaker's Lane. The building is cross-shaped, and built of corrugated iron, lined with sheet felt at the back. The wards, bathrooms, corridors, etc., are lined with a patent asbestos material, impervious to water, and also fireproof. The building is lined throughout with match-boarding. There are two fine large wards (male and female), which contain accommodation for four patients in each room. The size of the rooms is 30ft. by 12ft. The wards are connected with a passage, and look out upon two fine large verandahs, 42ft. by 9ft. each. Immediately to the left of the entrance hall is a large dining room, and to the right of the hall is the matron's sitting room. The wards stretch from left to right of the main hall, which leads to the doctors' room, and the matron's bedroom, and the scullery, larder, servants'

rooms, and stores, including coal-house, etc. The contractors were Messrs. Santo, Spencer and Co., of London and Ipswich, and Messrs. Hinnell and Son were responsible for the drainage and the foundations, which are of brick. Mr. W. D. Harding (borough surveyor) personally supervised the erection of the building, the foundations of which rest on gravel soil, which makes an ideal foundation for this class of building, being very dry. The sanatorium is 175 feet above the sea level, and commands a fine view of the valley of the Lark and the surrounding country.



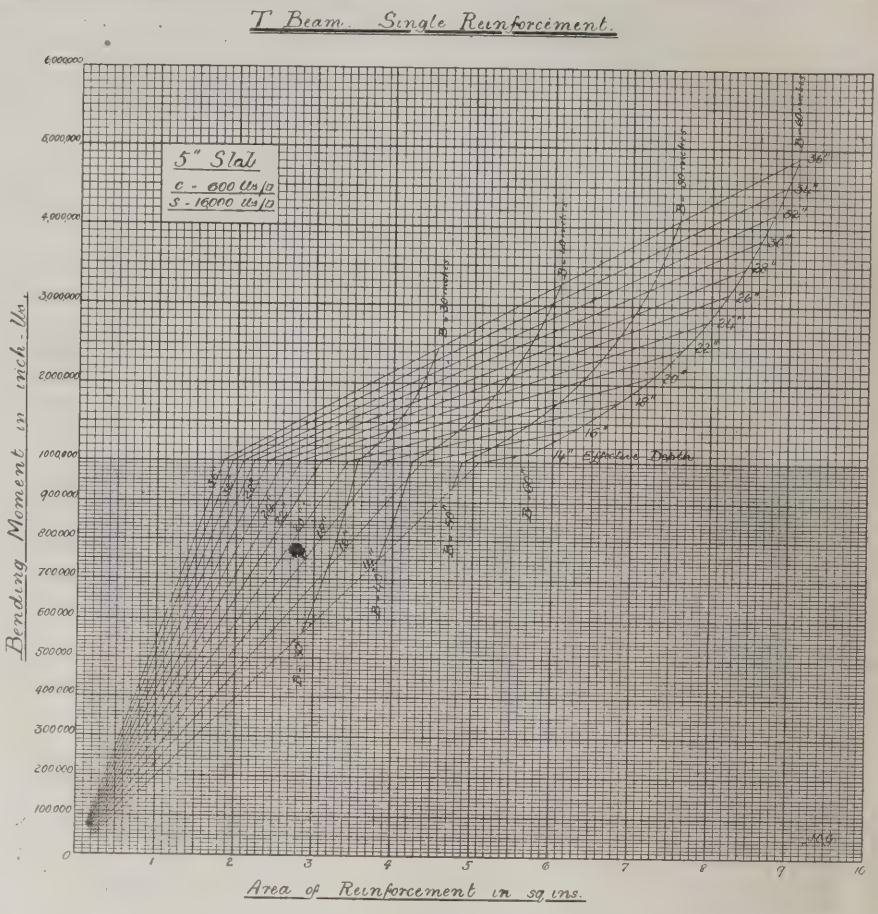
CRAIGEND.—A new school has been erected for the school Board of the East Church Parish of Perth (Landward) at a cost of £880. The school buildings—including mistresses' house (detached), erected at an additional cost of £570—are situated overlooking the main road on ground extending to about an acre, and the school itself provides accommodation for eighty pupils. There are two spacious and well-lighted classrooms, capable of being converted into a single apartment; while both boys' and girls' playgrounds are of large dimensions.

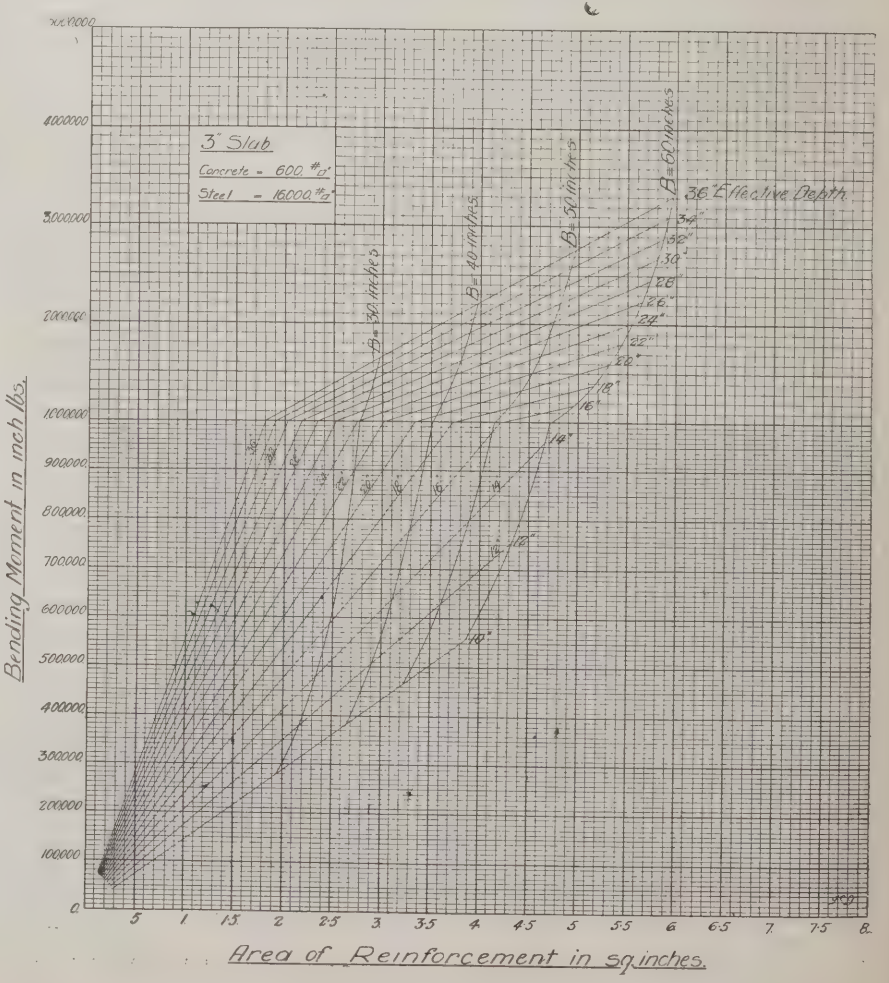
DESIGN OF T BEAMS.

By John C. Gammon, B.Sc. (Lond.); A.C.G.I.

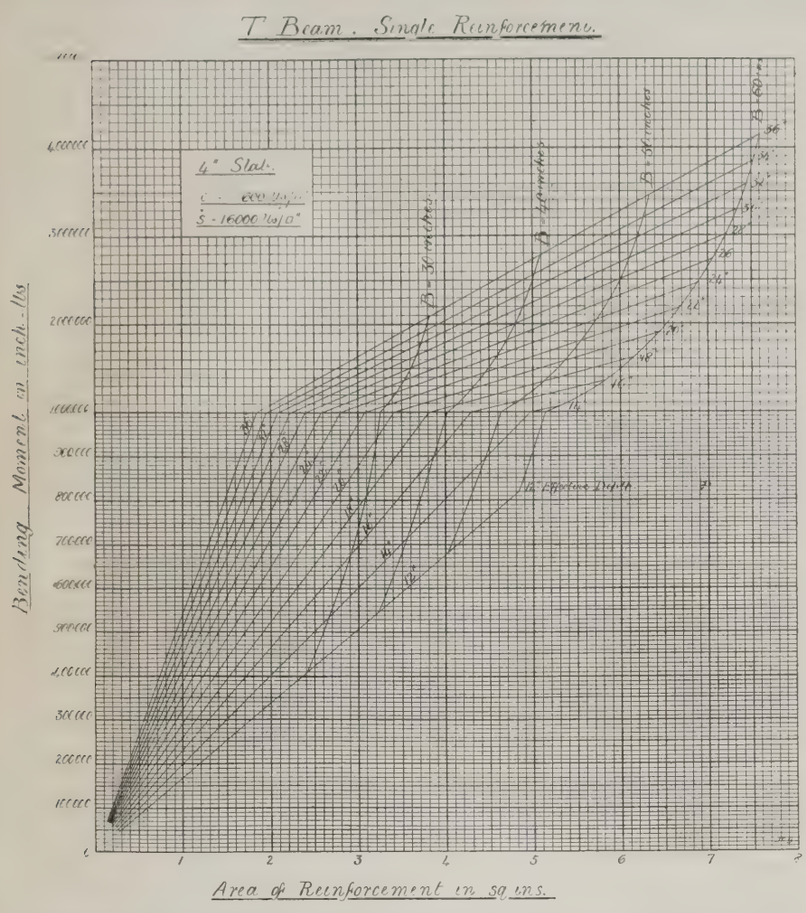
This article is intended to give a new and simplified method of designing T beams. The first series of curves are sufficient to design a T beam. when single reinforcement only is required, and when used in conjunction with the second series of curves are sufficient when double reinforcement is required.

The curves are based on the ordinary theory, and in accordance with the stresses recommended by the Royal Institute of British Architects. Thus the working stress in the steel is taken as 16,000lbs. per sq. inch, and the stress in the concrete as 600lbs. per sq. inch. The ratio of the modulus of elasticity of steel to that of concrete is assumed to be 15. Certain approximations are made, but involve no practical error. They are chiefly, (1) that the stress in the steel is uniformly distributed; (2) that the concrete takes no tension; (3) that for a given effective depth and thickness of slab the area of reinforcement (tensile) is proportional to the bending moment, i.e., the leverage arm remains constant. In the curves the leverage arm is calculated as that obtained when the stresses in both the steel and the concrete have their maximum permissible values. It will be altered to a very inconsiderable extent if corresponding values of the effective depth and area of steel are used, which give some smaller value for the stress in the concrete.





The following abbreviations are used:—



Area of Steel in Tension	= Wt
Area of Steel in Compression	= Wc
Effective depth of beam	= h.
Breadth of Slab, which can be developed	= B.
Thickness of Slab	= t.
Distance of Wc from top of Slab	= a.
Distance of neutral Axis from top of slab	= u.
Bending Moment	= M.

Single Reinforcement.

The first series of curves are used in the following way, and will give directly the value of "W" whether single or double reinforcement be required. The value of the bending moment having been found for the given conditions, together with the value of "t," corresponding values of "W" and "h" can

be read off from the curve drawn for the particular value of "t." The only condition to be fulfilled is that the point selected on the curve must fall within the line representing the maximum permissible value which can be given to B. That is to say, the breadth of slab which it is necessary to develop in order to keep the stress in the concrete below 600lbs. per sq. in. can also be found by interpolating values between or working on the curves representing B=30 inches, B=40 inches, B=50 inches, and B=60 inches. According to the rules of the R.I.B.A. Committee on Reinforced Concrete, the effective breadth of the slab should not exceed ¾ of the distance between the centres of beams nor one-third the clear span of the beams, and its value is also limited by a consideration of the resistance to shear of the slab used in conjunction with the T.

The working out of an example may better explain the utility of these curves.

Example:—

M = 1,200,000 in. lbs.
t = 4 inches.
B = 40 inches.

Then from curve drawn for t=4 inches, minimum permissible effective depth = 20 inches, when W_T = 4.1 sq. ins. for a value of M = 1,200,000 in. lbs. If a greater value of h, say 24 inches, be used with 3.37 sq. ins. of steel, then only 30 inches breadth of slab is required to keep the stress in the concrete below 600 lbs. per sq. in.; and since 40 inches breadth is available the concrete will be considerably understressed. For rough work it would be sufficiently accurate to say that the concrete is being stressed to $\frac{30}{40}$ of 600; or 450lbs. per sq. inch. On the other hand, if a less effective depth be used, the concrete by itself would be overstressed if the given curves were used; and it would certainly be most economical to use double reinforcement.

(To be concluded.)

BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

The annual meeting of the Builders' Clerks' Benevolent Institution was held at the offices of the Institution, 21, New Bridge Street, E.C., on Tuesday evening of last week.

Mr. Leonard Horner (president) occupied the chair, and there were also present Mr. E. Brooks (hon. treasurer), Messrs. Gammon, Mackness, Ward, Stansfield, Oldham, Leach, Hadland, and Newling; also there were present Mr. W. Downs, the president elect, and Mr. J. Austin, secretary.

After the usual formal business, the secretary read the report, which ran as follows:—

"Your committee have pleasure in submitting the forty-third annual report and financial statement, which shows the continued interest in the institution of so many connected with the building trade. The amounts received during the past year were as follows:

Annual subscriptions	£189	0	0
Donations	452	5	0
Dividends	172	10	0
Interest on deposit	1	16	7
Balance from dinner account ...	17	3	4
Bank charge remitted		10	6
	£833	5	5

Out of this sum £703 has been paid in pensions, and £23 6s. 6d. disbursed in affording temporary relief. Since the last report one of the pensioners, a widow, died. When deciding to have an election to fill up the vacancy thus caused, your Committee declared two vacancies, feeling that they were justified in doing so, owing to the successful efforts of the president in obtaining subscriptions and donations. There are now twenty-eight widows and two aged clerks receiving pensions. This is the extreme limit allowed by the funds at the disposal of the committee, and they would like it put before you that there are several deserving cases known to the Committee to which help cannot be extended through lack of funds. Your Committee take this opportunity of recording their heartiest thanks to Mr. Leonard Horner for his unremitting efforts in so successfully working for the institution. They also gratefully acknowledge the generosity of the hon. solicitors, auditors, architects, builders, surveyors, in continuing their assistance to the institution. Mr. Wm. Downs has kindly consented to accept the office of president for the ensuing year. By Rule 11, section 3, one-third of your committee retire, and being eligible, offer themselves for re-election."

Mr. Brooks then read the financial statement of the year, which showed that the total income for the year was £1,002 12s. 3d., and the total amount to the credit of the institution was £7,742 5s. 4d.

Mr. Leonard Horner, in moving the adoption of the report, said that as president he had followed a very good man, and among the things he said when he retired, he (Mr. Horner) could only repeat. He would like to congratulate the Committee on the report and the balance-sheet. There had been a great depression of trade during the year, but when the boom did come, as it undoubtedly must, he hoped for better times. He anticipated, however, one or two more years of some slight depression. But in the meantime they must keep matters connected with the society going, and he must congratulate the hon. treasurer (Mr. Brooks) on his report of funds in hand to the tune of something over £7,000. (Applause.) That sum was also a tribute to the excellent work which the Committee had done, and, in fact, to all connected with the society. He desired to move that the report and balance-sheet as read should be adopted and printed, together with a list of subscribers and the rules of the institution.

Mr. Leach seconded the resolution. In doing so he paid a compliment to Mr. Horner. Of course, he said, they must remember the circumstances under which Mr. Horner honoured the institution by becoming the president when things looked very black for them at the time. And now, after twelve months had passed by, they had to congratulate him on a magnificent year. It was due to the tremendous energy of Mr. Horner in attending to the work of the institution that they had gained such a splendid result. (Applause.)

The resolution was carried.

Mr. Oldham proposed a hearty vote of thanks to the retiring officers of the institution. They were Mr. Leonard Horner (president), Messrs. H. Brooks (hon. treasurer), Thomas Stirling, Ernest E. Ridler, and F. Tomlinson (hon. auditors), Amphlett, Clarke, Gammon, and Hadland (committee). It behoved them, he said, year after year to thank all their presidents for the very great help they had received from them. It was really difficult to know how to distinguish between the loyalty and energy of one officer of their institution and another, but with regard to Mr. Leonard Horner, he must say that the very gracious support he had given to them during the year had eclipsed all previous years. (Applause.) Although many presidents previously had attended regularly to the meetings of the committee, they could hardly expect many to follow Mr. Horner who could attend those meetings more than he had done. (Applause.) They could not find if they looked through the records that he had been absent once except during his holiday time. (Applause.) The small things which they attributed to him were very little compared with what they intended to say of him. (Applause.) He hoped that he had long years before him to be with them, and he expressed the sincere hope that Mr. Horner would never miss one of their annual dinners, and that he would be there at those annual functions as long as the institution existed. (Applause.) The auditors had given their services gratis, and had carried out their work very ably. The retiring members of the Committee had been very regular in their attendance, and the duties

they had to perform in making their sad inquiries into deserving cases which it was the object of the institution to relieve, had been performed in the most generous fashion. (Applause).

Mr. Mackness seconded. He said that the resolution had been so ably proposed that it required a very few words on his part. He must add his tribute to the president in thanking him for what he had done for the institution in the past year. It had been said that the President had come to them when things were looking very black. Looking at it at the end of the year, they owed Mr. Horner a sincere debt of gratitude. (Applause.) He came from the East End, and most people looked upon the East End as a poor part of London. (Laughter.) But from the East End Mr. Horner had brought a dinner list of subscriptions of £450. (Applause). He did not think in the future that they must look upon the East End as a poor part of London. (Laughter and applause). He must remind them that were it not for the help of that institution many of their unfortunates—unfortunate through no fault of their own—would not be able to keep their homes together. He hoped that in years to come the work which the President had done during the past year in enabling them to alleviate this distress, would be a source of joy to him. (Applause.)

The resolution was carried unanimously.

Mr. Leonard Horner, who was received with applause when he rose to reply, said that he felt rather overwhelmed by the praise they had given him for doing nothing at all. He could look back with great pleasure to his year of office, in that he had been enabled to help to do a little good, and also that he had made friends. He would look forward to having a great many dinners with the members of the institution. (Laughter.) He also thanked them on behalf of the retiring officers, especially on behalf of Mr. Brooks. Mr. Brooks had been with them many years, and they knew "He is all right." (Applause.) If they came to work it out, the Institution was very much indebted to the members of the Committee for all they had done, and the auditors were very good to do what they had done for them. (Applause.)

Mr. Newling moved, that Mr. Wm. Downs —(applause)—should be elected chairman, and that Mr. H. Brooks (hon. treasurer), Messrs. Thomas Stirling, Ernest E. Ridler, and E. Tomlinson (auditors), and Messrs. Amphlett, Clarke, Gammon, and Headland (committee), be re-elected to the positions which they formerly held. He must tender the thanks of the committee to Mr. Downs for consenting to become the president over them. No better gentlemen than the auditors could possibly be appointed, and with regard to the treasurer, he would be very very deeply missed. (Applause.) With regard to the committeemen, he must say that they were all united in the one desire to advance the interests of the society, and when they thanked one they thanked all.

Mr. Ward, in seconding, endorsed the remarks.

The resolution was carried.

Mr. Leonard Horner, in replying, said he would like to say that Mr. Downs was coming in at the end of several bad years, but he knew the committee would extend to Mr. Downs the same great help they had extended to him. (Applause.) If they did, then Mr. Downs's year of office would be a success. (Applause.)

Mr. Downs then took the chair amid applause. He thanked them very much for the kind way in which they had received him, and he promised his best endeavour to do all he could for the society and give it his best support. (Applause.)

Mr. Brooks moved, and Mr. Stansfield seconded, the appointment of Mr. H. Chatfeild Clarke, F.R.I.B.A., F.S.I., and Mr. Herbert W. Horner as vice-presidents, of the institution.

A vote of thanks to the new President brought the proceedings to a close.

LONDON MASTER BUILDERS' ASSOCIATION.

Annual Dinner.

The annual dinner of the London Master Builders' Association was held in the Whitehall Rooms, Hotel Metropole, last Thursday evening. The rooms had been greatly improved by redecoration in a scheme of white and gold, with scarlet hangings. There was a large gathering, and amongst those present were the President, Mr. F. G. Rice, Messrs. James Carmichael, J.P., H. H. Bartlett (past president), W. F. Wallis, J.P. (president, Institute of Builders), Joseph Randall (past president), S. Smethhurst, J.P. (president, National Federation), Ernest J. Brown (past president), F. L. Dove, L.C.C. (past president), Frank May, J.P. (past president), T. Gregory, J.P. (past president), Fred Higgs (past president), James S. Holiday (treasurer), Leonard Horner (senior vice-president), G. Bird Godson (vice-president), Wm. Laurence, junr., H. Arthur Bartlett, Howard W. Trollope, Wm. H. Hammond, F. G. Minter, Ernest N. Kent, H. S. Greenwood, B. T. Greenwood, J. B. Depree, A. G. White (secretary, National Federation), J. Chessum, R. J. Holliday, A. D. S. Rice, C. W. Latter, F. P. Rider, Alex. Ritchie, J.P., W. Godson, Clement B. Broad, John C. Broad, E. O. Snewin, H. C. Snewin, L. C. Randall, C. J. Trollope, Clifford C. Trollope, and Mr. T. Costigan (secretary).

Among the visitors present were Messrs. Davidson Dalziel, M.P., Jas. S. Gibson, F.R.I.B.A., Alex. R. Stenning, F.R.I.B.A. F.S.I. (president, Surveyors' Institution), A. Stoner (Master Tylers' and Bricklayers' Company), Professor Elsey Smith, M.A., Alan George, G. Corderoy, F.S.I., H. H. Statham, F.R.I.B.A., H. T. A. Chidgey (president, Quantity Surveyors' Institution), J. Osborne Smith, F.R.I.B.A., F. Dare Clapham, F.R.I.B.A., Percy Tubbs, F.R.I.B.A., A. H. Ryan-Tennison, F.R.I.B.A., J. J. Joass, E. Keynes Purchase, F.R.I.B.A., W. E. Hewitt, F.R.I.B.A., and many others.

After the loyal toasts Mr. W. F. Wallis (president of the Institute of Builders) rose to propose the toast of "The Houses of Parliament." He said that had he known, when asked by his friend, Mr. Rice, to propose a toast, the nature of that toast, he would not have so readily consented. Like Agag he felt the necessity of walking delicately. They had just passed through a General Election, and they were now in the midst of a crisis. He found comfort in the fact that Great Britain was not singular in that respect, and instanced Prussia, Saxony and Austria-Hungary as countries that were also in the throes of a crisis of a constitutional nature. Mr. Wallis proceeded to give an amusing picture of an old time election, with the hustings, the rival mobs and the clash of their respective bands. He feared our modern elections were deadly dull in comparison. He admired however the great earnestness with which the modern politician regarded his duties. Regarding the House of Commons, he was a "House of Commons man" and he felt proud of that house. The House of Lords too was enhanced by the claims of antiquity and sentiment. It included many men of brilliant careers.

Mr. Davidson Dalziel, M.P., said he had great diffidence in responding to the toast, for he was one of the youngest members (though not in years) of the present House of Commons, and regarding that House it was perhaps not his place to say very much. If Mr. Wallis, however, thought that the modern election was dull, or that it lacked the attributes of fervour and excitement, he could assure him that that was not the case. He (Mr. Dalziel) had just come through a very warmly contested election, and even as regards music they had had the Land Song to occupy their attention. At present we were passing through a crisis, a crisis that he thought raised the momentous question of whether this country should be governed by a single chamber or not. He could assure them that he would do his utmost to uphold the dignity of the House of Commons. Regarding the House of Lords he felt the necessity of steering clear of any controversial topic; but he thought that if the Peers had erred, they had erred honestly. The House did not consist wholly of men who were merely the sons of their fathers; but included many men who had served the nation in high official positions or who had previously represented constituencies in the House of Commons.

Mr. F. Higgs proposed the toast of "Art and Science." He said the English language was peculiar. The word "Art" had many meanings and applications. For instance—"artful" and "artless," though in neither case could such applications apply to the architects or surveyors. The dictionary meanings of the word had not satisfied him; and he had therefore coined one of his own. He thought art was "the outward expression of the beautiful visions of the mind." That he thought was true art. He instanced as examples in painting, Raphael's "Madonna," and the "Mater Consolatrice"; in sculpture, the Venus of Milo and Michael Angelo's "David." Architecture, with which he was more concerned, might be defined, he thought, as "the beauty of majesty and strength in proportion." It had been his privilege to travel and see many of the fine buildings of the world. He instanced the Pantheon and the Colosseum at Rome; the great Gothic cathedrals of the West, exemplifying the beauty of Nature and the mysteries of the Christian religion; in the Classic Renaissance, St. Peter's at Rome and the Cathedral and Baptistery at Florence, and many of the buildings in Venice; in London, St. Paul's Cathedral and Somerset House; our Tudor domestic architecture and in the Gothic Revival, the Houses of Parliament and the Law Courts. Coming to more recent times he thought the Roman Catholic Cathedral in Westminster was a wonderful work, and he also commended Sir Aston Webb's Victoria and Albert Museum as a piece of original design. What we wanted to-day, and what would be better for architects, surveyors and builders, was a revival of the old patrons of the Arts. Regarding science he had also looked up dictionary meanings, but preferred one of his own; he thought science might be defined as "the exact knowledge of the comprehensible." In reality his toast of "Art and Science" was only the old one of "The Architects and Surveyors" in a new dress. And as regards surveyors, he thought that the quantity surveyors were a great adjunct to the building trade, that they often exhibited a splendid effort of the imagination in dealing with plans, having no details, impossible sections and specifications that had to be written up from their own bills.

Mr. J. S. Gibson replying for Art said he had been much interested in Mr. Higgs' definitions, but he was not to be drawn into an attempt at definitions of Art. He thought Art was an instinct. In his verdant days he took a great interest in the historical side of Art, and had read much about those patrons to whom Mr. Higgs had referred. What struck him was the manner in which those patrons had travelled and educated themselves to an appreciation of the beautiful things which existed in the world. Nowadays this was not a common occurrence. He thought the reason might be, that with our personally conducted tours from Egypt to the North Pole we took travel too light-heartedly. The architect had, perhaps, a greater opportunity than the painters and sculptors. Their work could only be seen in museums and picture galleries by those who troubled to visit them; but the work of the architect was to be found in every street, and appealed to everyone who walked along our thoroughfares.

Mr. Alexander Stenning briefly replied for science

Mr. H. T. A. Chidgey said he thought that his toast, "The London Master Builders' Association" was the most important toast of the evening. The London Master Builders' Association had often been compared to the City Guilds, but there was this essential difference between them, that the old City

Guilds limited their members to those within the square mile, while the London Master Builders' Association embraced all the members of the various trades in Greater London. Moreover, the City Guilds included many members of trades other than those they were representative of. There was not much connection between quantity surveying and basket making, and yet he had the privilege of being a member of the Basket Makers' Company. The City Guilds also represented many extinct trades, while the London Master Builders' Association was alive and flourishing. He thought the art and craft of building presented great ideals, but the necessity for a federation was never more apparent than to-day. "Union is Strength" was an old motto, and if the London Master Builders' Association had not already a motto, he thought that the old one of "Defence not Defiance" would not be inappropriate. Mr. Chidgey then referred to the excellent hand-book issued by the Association and detailed many of the points of the Association's activity as set out therein. He referred to the present difficulty over arbitration owing to the custom of public bodies appointing their architect or engineer as sole arbitrator in the event of disputes between them and their contractors. He thought an entirely impartial arbitrator should be appointed.

Mr. F. G. Rice, the president, in responding, said that when he entered on his year of office he determined to maintain the high traditions of the long list of presidents who had preceded him, and if he had maintained, in some part, that reputation, he had been amply repaid by the cordiality with which the toast had been received. He desired to record in what great measure he had been assisted by his Council, though they must not suppose that his Council was wanting in criticism. They were past-masters in the art, but their criticism was of a constructive and not destructive character. That night was the 38th anniversary of the Association, and it was not given to every one present to remember the start. The toast was coupled with his own name and with that of Mr. F. J. Dove, who was, unfortunately, prevented by the weather from attending. When he entered on his year of office he received a legacy—it was not often that a builder got a legacy—but he had one. One thing was to get the new office premises and the other to set the Organisation Committee going. Both these matters had been accomplished. Mr. Rice mentioned what a great pleasure it had been to the association to entertain the Belgian master builders. Referring to the question of Bills in Parliament affecting the building trade, he said that they had been told to keep two eyes on the Government. He instanced a number of Bills in the past year to which they had had to devote their attention, but hoped the Government would not make capital more shy than it was at present. Mr. Chidgey had referred to the activity of the building trade, but he was sorry he could not agree with him. It had been said in the course of the L.C.C. election campaign that the L.C.C. Works Department was the *bête noire* of the building trade. This, however, was not the case. But at the time of the inception of the Works Department, the L.C.C. had made the conditions of contract so onerous that no respecting builder would tender. The London builders worked upon the rates of wages and conditions of employment agreed upon between them and the men's unions, but they did require that more than 28 bricks per hour should be laid. That he was told was the rate of work accomplished on one of the Works Department jobs. What was the *bête noire* of the building trade, was the sub-contractor who took all the work and caused endless friction. Builders might not be able to lay mosaic floors, but they could carry out the joinery; they might not be able to lay some patent concrete flooring, but they could construct the ordinary concrete floor. Builders were tired of sitting in the middle of their jobs handing out cheques to all and sundry. He appealed to architects to remember that respectable builders had a great interest in their work and a pride in their buildings, quite apart from any financial aspect.

Mr. James Carmichael proposed the toast of "The Guests." to which Mr. H. H. Statham, F.R.I.B.A., responded.

The L.M.B.A. Handbook.

We have received a copy of the London Master Builders' handbook for the current year, and we hear that a number of very gratifying letters are being received by the association from leading architects and surveyors, with reference to the preface in the book. As many of our readers may not have seen this preface mentioned, the following extract may be found interesting:—

"Membership of the association entails heavy financial sacrifice, and although the list of members shows that the bulk of the more influential building firms in London belong to the organisation, it is a regrettable fact that there are still a few London contractors and some provincial ones, who frequently execute work in London, and who while enjoying all the advantages reaped by the sacrifice of their organised brethren, contribute nothing themselves and selfishly hold aloof.

"The policy of the association has always been one of peace, and it is mainly owing to its conciliatory action that the building trade has, for so many years, been exempted from the labour dissensions which have disturbed many other industries during that period.

"The interests of architects and surveyors in this, as in many other respects, are identical with those of builders, and the attention of the architectural and surveying professions is particularly directed to this view of their obligations to the organised members of the building trade.

"If, as a consequence, the London members of the Royal Institute of British Architects and those of the Institutions of Surveyors will make it a practice to employ upon their works such contractors only as are members of the London Master Builders' Association, they will not only be serving the interests of their clients and themselves in the direction referred to, but will greatly assist in the strengthening of the Builders' Organisation, with the result that irregular practices which, from time to time, form the subject of complaint and conference, can be effectually prevented.

"A similar observation to the foregoing is applicable to their provincial members, who, it is suggested, should employ only members of the various Employers' Associations embraced in the National Federation, of which London is one of the centres.

"That great financial sacrifice is made by its members there is no doubt, and a considerable amount of time must have been given by the Executive and Council to the management of the association. It is owing to their efforts that the trade has been free from labour troubles for some years past, and we hope the association is now going to reap its reward with the building owner, architect, and surveyor.

"It must be admitted that the London Master Builders' Association has benefited the trade in general, and the time has come when architects should recognise the fact, and only invite those firms to tender who are members of the association."

Trade and Craft.

Terrazzo Plates.

A floor covering which is claimed to be an ideal one for tropical climates is that of cement or terrazzo plates. Cement plates have to be made richly coloured, and if produced by means of powerful joint lever or hydraulic presses, they are indestructible in use. The considerable rise that has taken place in the plate industry in India, Java, etc., gives sufficient evidence as to the lucrative nature of such plants. In purchasing the requisite machinery, it is advisable only to apply to leading firms, the reputation and experience of whom in this branch of the industry will guarantee proper execution of orders. The firm of Dr. Gaspary and Co., Markranstadt-bei-Leipzig (Germany) may be named as having amongst their customers some of the largest establishments in this country and as undertaking the design and equipment of complete plants by their own erectors. An important speciality of the firm is the manufacture of cement colours: the colours being produced in the firm's own extensive works and tested at their own cement goods factory, every possible security is afforded to customers that they will only be supplied with the best and most suitable materials. The firm will be pleased to furnish full particulars and any information on these subjects free of cost.

Expanded Metal for Plaster-work.

Expanded Metal is made from sheets of rolled metal of various thicknesses, cut and expanded by machinery into meshes of various shapes, each of which is made in several strengths or weights. The ¼-in., ⅜-in., and 7-16-in. mesh lathings, which are made from sheets of rolled steel, are particularly adapted to form a key for plaster in ceilings, steelwork encasing, solid and hollow partitions, exterior walls, and other plasterwork. There are, however, special concrete meshes, in various weights, which are also made from sheets of rolled steel, and are specially suitable as reinforcement for concrete in foundations, walls, floors, roofs, arches, bridges, retaining walls, and other work demanding great strength. The lighter weights of the ¾-in. and 1½-in. diamond meshes (steel) are frequently used in concrete for encasing steelwork. Any of the meshes may be used for openwork partitions, fencing, machinery guards, and in almost limitless other applications.

The expanded metal lathings for plasterwork in fire-resisting and other building construction are dealt with in "Pamphlet No. 1," of which a sixth edition has been issued by the Expanded Metal Company, Ltd., York Mansion, York Street, Westminster; while "Pamphlet No. 2" deals with and is entitled "Expanded Steel for Reinforced Concrete Construction."

It is the first of these pamphlets to which attention is now more particularly drawn. It is more than a mere catalogue or price-list, as it contains a great deal of matter that is of real practical value. The three types of expanded metal—diamond-mesh, cup-mesh, and square-mesh—are, of course, illustrated, and there are many detail illustrations which are of considerable value as showing the best methods of dealing with a large variety of problems, whether simple or complex, of building construction, ordinary and extraordinary. There are details of a suspended ceiling, with a section through floor and ceiling, and the various forms of clips and hangers used in suspended ceiling work are shown and explained. Sections are shown and described of girder encasing, wall casing or covering, air-ducts, false beams, cornices, pillars, etc.; actual examples—as, for instance, at the Ritz Hotel, the Capital and Counties Bank (London), offices of Crown Agents for the Colonies—being frequently given in illustration of the various uses of expanded metal. These examples, and many other detail engravings, give, as we have said, high practical value to the pamphlet, which contains also many interesting views of important works in which the system has been or is being employed.

Speaker's "Eternit."

The success of Messrs. G. R. Speaker and Co.'s "Eternit" in diverse applications and in various countries is strikingly shown in an illustrated booklet on the system which has just been issued by the firm, who are engineers and contractors to H.M. Government, and whose address is 29, Mincing Lane, and 26 and 28, Mark Lane, London, E.C.. "Eternit" or asbestos cement roofing tiles are about ⅛in. thick, and, externally and to the touch, resemble high-quality slates, but are lighter

and of much greater tensile strength. The average weight is no more than about 21lbs. per square yard, allowing for 2¾in. lap, as compared with 67lbs. for Welsh slate and 80lbs. for red roof tiles.

All fire assurance companies accept "Eternit" as being fire-resisting and incombustible. Possibly cork is a worse conductor of heat and cold than "Eternit," which, however, has in this respect no other superior. Hence roofing of this material keeps the building cool in summer and temperate in winter. After three months' exposure, during which these tiles absorb moisture in exactly the same ratio as the best Welsh slates, and thirty per cent. less than that of terra cotta roof tiles, absorption entirely ceases; and, "Eternit" tiles having perfectly smooth faces, which permit of their being laid diagonally and with close joints, make roofs that are thoroughly weathertight and damp-resisting. Another advantage over slates is the superior toughness of Eternit tiles, which eliminates breakage in transit, tackling, and fixing. The tensile strength is 5,781lbs. per square inch, and the crushing force 8,281lbs. per square inch. The consequent economy in freight, labour, masonry work, and quick finish is very obvious. This greatly reduces the initial cost; and the cost of upkeep is practically nil. The tiles are supplied in three colours, grey, blue, and terra-cotta, and there is a choice of three different patterns of laying; and as these tiles are exquisitely finished, they are æsthetically very pleasing; and this fact, taken in conjunction with their lightness, durability, and efficiency, renders them admirably adaptable to many and various services. A pamphlet issued by Messrs. Speaker shows the application to a large number and variety of buildings, large and small, which have not only been roofed with Eternit, but the labour necessary to the fixing has all been done by Messrs. G. R. Speaker and Co.'s Engineering Department.

Reinforced Brickwork.

The principle of reinforcement having enormously increased the value and utility of concrete, the use of which was formerly almost confined to foundation work, because it was incapable of withstanding high tensional stresses, the question arose whether brickwork could not be similarly strengthened, with corresponding advantages. Messrs. Richard Johnson, Clapham and Morris, Ltd., 24 and 26, Lever Street, Manchester, have issued an illustrated booklet in which they show how this object has been effectually realised. The reinforcement they employ is a wire mesh 2ins. and 2½ins. in width, with, respectively, three and four straight tensional wires running its entire length, the wire being made from best quality mild steel of uniform temper. This mesh, when embedded in the mortar joints of the brickwork, forms a continuous bound, so that the mortar, instead of being merely a filling, becomes the strength of the brick wall, the brickwork being thus "rendered as monolithic as reinforced concrete." The action of the wire mesh when resisting tensional stresses is to reduce its sectional area, which in turn tends to close the meshes of the wire, and so compresses the mortar locked therein. The mortar at once develops its greatest strength, which is resistance to compression. The tensional stresses in the wire are partly arrested by the mortar developing its greatest strength, in which it is materially assisted by being firmly held by the bricks above and below it. Moreover, the metal being of small section, distributed throughout the joints, and protected by the courses of brick, there is practically no expansion in case of fire, to which reinforced brickwork offers the utmost resistance. The superior strength of reinforced brickwork enables the building of much thinner walls than is possible with ordinary brickwork, thus ensuring economy of space as well as of material. Many interesting applications of the system are illustrated in the pamphlet.

Coming Events.

Wednesday, March 2.

CARPENTERS' HALL LECTURES.—Mr. C. F. A. Voysey, on "Castles in the Air," 7.30 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION.—Council meeting, 7 p.m. Ordinary meeting, 7.30 p.m. Paper by Mr. Joseph Oswald.

THE ROYAL SANITARY INSTITUTE LECTURES.—Mr. E. J. Steegmann on "Elementary Science," 7 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. J. H. Stevenson on "Heraldry as Applied to Architecture," 8 p.m.

R.I.B.A.—Art Committee Meeting.

ROYAL SOCIETY OF ARTS.—Mr. E. Cooke on "The Teaching of Design," 8 p.m.

Thursday, March 3.

THE INSTITUTE MEMBERS' CLUB.—(Room 519, Caxton House, Westminster).—Special meeting, 6 p.m.

Friday, March 4.

ARCHITECTURAL ASSOCIATION.—Mr. J. A. Gotch on "The Mediæval House," 7.30 p.m.

ROYAL SANITARY INSTITUTE.—Mr. E. J. Steegmann on Elementary Science, 7 p.m.

LEICESTER AND LEICESTERSHIRE SOCIETY OF ARCHITECTS.—Mr. J. Armitage on "Wood-Carving," 8 p.m., at 5, St. Martin's East.

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row.—Mr. W. W. Watts' 2nd Lecture on "The History and Development of English Silversmiths' Work," 6 p.m.

L.C.C. SCHOOL OF BUILDING, BRIXTON.—Mr. E. P. Wells on "Reinforced Concrete," 7.30 p.m.

Saturday, March 5.

ABERDEEN ARCHITECTURAL ASSOCIATION.—Exhibition of Sketches and Criticism of Designs. Exhibition of work by students of Liverpool University School of Architecture at Aberdeen Art Gallery closes.

Monday, March 7.

ROYAL SANITARY INSTITUTE.—Mr. E. J. Steegmann on "Elementary Science," 7 p.m.

SURVEYORS' INSTITUTION.—Mr. J. C. Rogers on "The Surveyors' Institution: a forty years' Retrospect," 8 p.m.

Tuesday, March 8.

ROYAL SOCIETY OF ARTS (Cantor Lectures).—Mr. Lawrence Weaver's First Lecture on "Lead Work," 8 p.m.

UNIVERSITY EXTENSION LECTURES ON ANCIENT ARCHITECTURE.—Mr. Banister Fletcher on "Early Christian Architecture: Basilican Churches outside Rome, Baptisteries, Tombs, etc.," British Museum, 4.30 p.m.

MANCHESTER BUILDING AND SANITARY TRADES' EXHIBITION.—Opens at City Exhibition Hall, Manchester.

INSTITUTION OF SANITARY ENGINEERS.—Students' lecture. Mr. J. H. Smyth, on "Quantities and Measurements of Sanitary Works," 7 p.m.

Wednesday, March 9.

CARPENTERS' HALL LECTURES.—Mr. Halsey Ricardo on "The Use of Coloured Materials in Building," 7.30 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION.—Opening of the R.I.B.A. Exhibition of Prize Drawings.

ROYAL SANITARY INSTITUTE.—Mr. E. J. Steegmann on "Elementary Science," 7 p.m

EDINBURGH ARCHITECTURAL ASSOCIATION.—Professor W. E. F. Britten on "Decoration," 8 p.m.

Thursday, March 10.

R.I.B.A.—Science Committee meets.

Friday, March 11.

ARCHITECTURAL ASSOCIATION DEBATING SOCIETY.—"The Story of the Crafts in Relation to the Practice of Architecture." Mr. A. R. Jemmett, F.R.I.B.A. (joint meeting with the Art Workers' Guild), 7 p.m.

ROYAL SANITARY INSTITUTE.—Mr. W. C. Tyndale on "Calculations, Measurements, and Plans, and Sections," 7 p.m.

Provincial Sessional Meeting, Newcastle-on-Tyne, Town Hall, Newcastle, Dr. H. Kerr, on "Sanitary Administration, with special reference to legislation, past and recent."

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS (Southampton Row).—Mr. Allan S. Cole, C.B., 1st Lecture on "Some Ancient Textile Patterns," 6 p.m.

Saturday, March 12.

R.I.B.A.—Last day for receiving applications for election at the meeting on June 6th.

ROYAL SANITARY INSTITUTE.—Provincial Sessional meeting, Newcastle-on-Tyne. Visits to Corporation tenements, Model Cottage Exhibition, Infectious Diseases Hospital, and to Sewage Works.

ST. BARTHOLOMEW-THE-GREAT, WEST SMITHFIELD, LONDON.—Lecture on History and Architecture of the Church, 2.30 p.m. Organ recital, 2 p.m. Collection for Restoration Debt Fund.

Monday, March 14.

THE SURVEYORS' INSTITUTION.—The Professional Associate examination commences.

ROYAL SANITARY INSTITUTE.—Professor Henry Adams on "Building Materials," 7 p.m.

R.I.B.A.—Mr. A. A. Hudson on "The Business side of Architecture," 8 p.m.

ROYAL SOCIETY OF ARTS (Cantor Lectures).—Mr. Lawrence Weaver's second lecture on "Lead Work," 8 p.m.

Tuesday, March 15.

UNIVERSITY EXTENSION LECTURES ON ANCIENT ARCITECTURE. — Mr. Banister Fletcher on "Byzantine Architecture: the Architectural Character of the Early Churches." British Museum, 4.30 p.m.

R.I.B.A.—Practice Committee meets.

INSTITUTE OF SANITARY ENGINEERS.—Students' Lecture. Mr. Nandy Hoskins on "Materials," 7 p.m.

Wednesday, March 16.

CARPENTERS' HALL LECTURES.—Professor G. E. Moira on "Mural Painting," 7.30 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION.—Annual meeting. Exhibition of Students' work and Prize-distribution, 7.30 p.m.

ROYAL SANITARY INSTITUTE.—Professor Henry Adams on "Sanitary Building: Construction and Planning," 7 p.m.

ROYAL SOCIETY OF ARTS.—Mr. Noel Heaton on "The Foundations of Stained Glass Work," 8 p.m.

Thursday, March 17.

R.I.B.A.—Literature Committee meets.

Friday, March 18.

ARCHITECTURAL ASSOCIATION.—Professor Beresford Pite on "Filippo Brunelleschi and the Renaissance." Nomination of officers, 7.30 p.m.

ROYAL SANITARY INSTITUTE.—Mr. W. C. Tyndale on "Sanitary Appliances," 7 p.m.

LEICESTER AND LEICESTERSHIRE SOCIETY OF ARCHITECTS.—Mr. A. Herbert on "The Influence of the Classical Revival in Leicester," 8 p.m.

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS (Southampton Row).—Mr. Allan S. Cole, C.B., 2nd Lecture on "Some Ancient Textile Patterns," 6 p.m

Saturday, March 19.

ABERDEEN ARCHITECTURAL ASSOCIATION.—Mr. Theodore Fyfe on "Architecture in Ancient Crete," 7.30 p.m.

MANCHESTER BUILDING AND SANITARY TRADES' EXHIBITION, City Exhibition Hall, closes.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Visit to the Royal College of Surgeons and to New Operating Theatre, Royal Infirmary, Edinburgh.

ST. BARTHOLOMEW-THE-GREAT, WEST SMITHFIELD, LONDON.—Lecture on the History and Architecture of the Church, 2.30 p.m. Organ Recital, 2 p.m. Collection for Restoration Debt Fund.

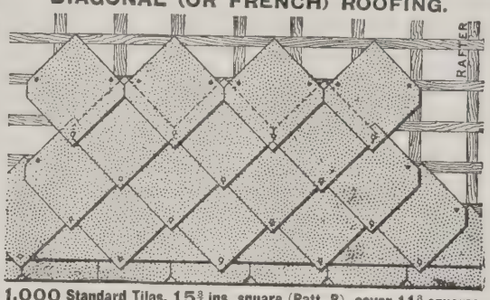
Monday, March 21.

INSTITUTE OF SANITARY ENGINEERS.—Mr. P. M. Fraser on "Contributions to the Study of Housing and Town-planning," 8 p.m.

Tuesday, March 22.

UNIVERSITY EXTENSION LECTURES ON ANCIENT ARCITECTURE. — Mr. Banister Fletcher on "Byzantine Architecture: the later Churches." British Museum, 4.30 p.m.

THE BEST OF ALL ROOFS



are made with

POILITE

ASBESTOS ROOFING SLATES

Absolutely Water and Fire-proof. Excellent Non-Conductors. Cool in Summer, Warm in Winter. Cheaper than Ordinary Slates—More easily laid. Much lighter in weight and more artistic in appearance.

DIAGONAL (OR FRENCH) ROOFING.

1,000 Standard Tiles, 15¾ ins. square (Patt. B), cover 11¼ squares.

POILITE SHEETS

For Interior Fire and Sound-Proof Lining.

BELL'S ASBESTOS CO. LTD. Southwark Street, London, S.E.

The QUALITY of the 'KOH-I-NOOR.'

If there is one thing that the 'Koh-I-Noor' Pencil is inseparably associated with, it is QUALITY. At first men thought that 4d. was too much to pay for a black-lead pencil—until they tried the 'Koh-I-Noor' Quality. After that they needed no further persuasion to buy, in fact, it sometimes proved difficult to cope with their demands for the 'Koh-I-Noor.' Nothing but 'Koh-I-Noor' would suffice.

If you are one of those who still think that 4d. is a stiff price to pay for a pencil, an experiment will only cost you 4d. It won't be a costly experiment either, seeing that one 'Koh-I-Noor' outlasts SIX ordinary pencils. And then—the luxury of writing with such a magnificently-made pencil! You cannot know what it means until you try 'Koh-I-Noor' Quality. And you will never go back when you do know.

Made in 17 degrees from the hardness of a stylo to the softness of a crayon. One to suit every pencil purpose.

'Koh-I-Noor' Pencils are 4d. each or 3s. 6d. per dozen. Of Stationers, &c. Illustrated particulars free for the asking from L. & C. Hardtmuth, 12, Golden Lane, London, E.C. (Paris, Vienna, Dresden, Milan, Brussels, New York).

This Way to Promotion

There is no standing still at your present work **or** pay if you let the International Correspondence Schools help you in your spare hours. **Employers themselves say so.** For instance, Mr. James Dalrymple, General Manager of the Glasgow Corporation Tramways, writes us:—

"I am pleased to state that a great many of the employees of this Department, in practically every section of the work, have taken out Courses of Education through the International Correspondence Schools. There is no doubt that the instruction they have received increases their efficiency as servants of the Department, and many of your students have been promoted to positions of responsibility in the service. I know also of several instances where employees of the Department who have studied under your system have left the service to take official positions in other tramways and railways in this country and abroad.

I am satisfied that your method of correspondence education is complete and thorough, and is filling a great want."

Now don't let this **employer's "tip"** slip you. I.C.S. training neither handicaps your present work nor your purse. If you want more important work, certain work, better pay and brighter future, fill in this coupon and post to-day.

"Better Position" Coupon

Tenders.

Addressed postcards, on which lists of tenders may be stated, will be sent free on application to the Manager, BUILDERS' JOURNAL, Caxton House, Westminster.

Information from accredited sources should be sent to "The Editor," at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Eltham.—For the erection of a Parish Hall for the Building Committee. Messrs. Moscrop, Young and Glanfield, 20, Brook Street, W., and Percy J. Waldram, F.S.I., 12, Buckingham Street, W.C., joint architects. Quantities supplied.

Main contract and alternative estimates.

Jones and Andrews	£2,382
William Blay	2,375
Thomas and Edge	2,306
W. Smith and Sons	2,297
F. and H. F. Higgs	2,268

A MOST IMPORTANT BOOK ON PAINT.
"OXIDE OF ZINC:
Its Nature, Properties, and Uses."
By J. CRUICKSHANK SMITH, B.Sc., F.C.S.
The remarkable increase in the use of Oxide of Zinc Paint during recent years, owing to the fact that it is innocuous and exceedingly durable, renders this book of great interest to Architects, Builders, Decorators, and others.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about **five days** or longer after the date of this issue.
Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders.
The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the Contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Mar. 2. **BRADFORD.**—Contractors desirous of tendering for iron and steel work, masons', joiners', plumbers', plasters', slaters', and painters' work, required in the extension of shed, gatehouse, etc., at New Lane Mills, Laisterdyke, Bradford, are requested to forward their names to William A. Ross, Architect, 10, Parkinson's Chambers, Hustlergate, Bradford.

March 2-15. **WHITLEY BAY.**—Erection of a new Council school, to accommodate 600 scholars, and a caretaker's dwelling-house, at Whitley Bay, for the Northumberland Education Committee. Contractors should forward particulars, name and address to the undersigned not later than March 2, together with a deposit of £2 2s. for specification and bills of quantities. Plans may be inspected at the office of Marshall and Tweedy, Architects, Eldon Square, Newcastle-on-Tyne. Tenders must be forwarded to C. Williams, Secretary to the Education Committee, The Moothall, Newcastle-on-Tyne.

Feb. 23—March 7. **LICHFIELD.**—Erection of 16b married soldiers' quarters, in one block, for the Secretary of State for War. Plans, specification, and conditions of contract, may be inspected at the office of the Director of Barrack Construction, 80, Pall Mall, London, S.W., or at the Barrack Construction Office, Whittington Heath Barracks, Lichfield, up to this day. Those desirous to tender and to receive a copy of the bills of quantities must apply to the Director of Barrack Construction not later than Feb. 25,, accompanied by a deposit of 10s. Cheques or orders to be made payable to the Assistant Financial Secretary, and crossed "Bank of England for Credit to Army Funds." Tenders must be delivered to H. De La Bere, Director of Army Contracts, War Office, Whitehall, London, S.W.

March 7. **ABERDARE.**—Erection of a Workmen's Hall Institute and Free Library, at Cwmbach, Aberdare. Plans and specifications can be seen, and bills of quantities obtained, upon application to Thomas Roderick, Architect, Clifton Street, Aberdare. Tenders to be sent to G. J. Davies, Osborne Villa, Cwmbach, near Aberdare.

March 7. **EXETER.**—Additions and alterations at St. Luke's College, Heavitree Road, Exeter, for the Diocesan Board of Education. Particulars can be obtained on application to the Architect, James Jerman, F.R.I.B.A., 1, Bedford Circus, Exeter, to whom tenders are to be sent.

March 7. **HALIFAX.**—Alteration of the Old Riding School, Halifax, into an electric theatre for the National Electric Theatres, Ltd. Plans and specifications can be seen and quantities obtained of Richard Horsfall and Son, Architects and Surveyors, 22a, Commercial Street, Halifax, to whom tenders are to be sent.

Mar. 7. **LIVERPOOL.**—Execution of jobbing repairs in connection with the Workhouse, Brownlow-hill, and other Parochial Buildings, from the 27 March, 1910, to 25 March, 1911, for the Select Vestry. Forms of tender and all information may be obtained on application to H. J. Hagger, Vestry Clerk, Parish Offices, Brownlow Hill.

March 8. **NEWPORT (Mon.).**—Supply of certain decorative oak fixtures, oak panelling, and other works, for Stevens, Confectioners, Limited, Cardiff, at the new premises, Davis Buildings, High Street, Newport, Mon. Plans can be seen and bills of quantities obtained of G. E. Halliday, F.R.I.B.A., 19, Castle Street, Cardiff, to whom tenders are to be sent.

March 8. **SOUTHGATE.**—Erection of thirty-four cottages at Tottenhall Road, Palmer's Green, for the U.D.C. Plans may be seen at the Council Offices, Palmer's Green, and forms of tender and copies of the specification obtained from the Council's Surveyor, C. G. Lawson, on depositing £2 in cash. Tenders must be sent to W. M. Ellenor, Clerk of the Council, Council Offices, Palmer's Green, N.

March 8. **SWINTON.**—Execution of alterations to the Parish Church. Plans may be seen at the office of the Architect, T. P. Marwick, 43, York Place, Edinburgh, or at the office of the Clerk to the Heritors, A. D. Walker, School House, Swinton, Duns. Schedules for mason, joiner, plumber, plaster, slater, and painter works may be obtained from the Architect on deposit of 10s. Tenders are to be delivered to the Clerk to the Heritors.

March 8. **DARLINGTON.**—Erection of offices for the Locomotive Department at Stooperdale, Darlington, for the N.E.R. Plans and specification may be seen and quantities and further information obtained upon application to William Bell, the Company's Architect at York. Quantities supplied on personal application to parties tendering for the whole of the works. Tenders to be sent to R. F. Dunnell, Secretary, York.

March 8. **BROMLEY (Middlesex).**—Execution of certain plastering work in the "E and F" ward at the Sick Asylum, Devons Road, Bromley-by-Bow, London, E., for the Managers of the Poplar and Stepney Sick Asylum District. Forms of tender, with all particulars, together with copies of specification, may be obtained on application to the Engineer and Superintendent of Labour at the Asylum. Tenders must be delivered to Walter R. Foskett, Clerk, Devons Road, Bromley-by-Bow, London, E.

March 9. **WINCHESTER.**—Repairs to some 46 cottages in different parts of Winchester. Specifications can be obtained of J. Ashton Sawyer, Chartered Surveyor. Tenders should be delivered to Walter Bailey, 19, St. Peter Street, Winchester.

March 9. **HETTON.**—Erection of a Council chamber and offices at Hetton-le-Hole, for the U.D.C. Plans and specifications may be seen and forms of tender obtained from the Surveyor, John Harding, Township Offices, Hetton-le-Hole, by forwarding stamped addressed foolscap envelope. Tenders to be forwarded to William Street, Houghton-le-Spring.

March 9. **CRUMPSALL.**—Erection of a dwarf wall and screen in connection with the covered passage at the workhouse at Crumpsall, for the Guardians. Bills of quantities may be had from the office of A. J. Murgatroyd, Architect, 23, Strutt Street, Manchester, upon deposit of 10s. 6d. Tenders to be delivered to James Macdonald, Clerk to the Guardians, Poor Law Offices, New Bridge Street, Manchester.

March 9. **CROYDON.**—Execution of the following building works at the Croydon Mental Hospital, Warlingham, Surrey. Extension of attendants' dining room (female side), for the Corporation. Plan and specification may be seen on application to the Borough Engineer, Town Hall, Croydon, and copies obtained on receipt of a deposit of £1 1s. Tenders to be sent to F. C. Lloyd, Clerk to the Visiting Committee, Town Hall, Croydon.

March 9. **HUDDERSFIELD.**—Erection of an elementary school at Birkby, Huddersfield, for the Corporation. Plans, specification, and general conditions may be seen, and bills of quantities and forms of tender obtained on application at the offices of K. F. Campbell, M.Inst.C.E., M.I.E.E., Borough Engineer, 1, Peel Street, on deposit of £2 2s. Tenders to be sent to J. Henry Field, Clerk to the Local Education Authority, Town Hall, Huddersfield.

March 10. **LONDON, E.**—Alterations at the Infirmary in Bancroft Road, Mile End, London, E. for the Guardians of the Poor. Forms of tender, with specifications, may be obtained upon application, enclosing stamped directed foolscap envelope, to Benjamin Catmur, Clerk to the Guardians, Guardians' Offices, Bancroft Road, Mile End, E., to whom tenders are to be sent.

March 11. **BROCKLEY.**—Erection of a chancel, etc., to Hedworth Church, near Brockley Whins Station. Plans and specification on application at the Vicarage, up to 11th inst. Tenders are to be sent to C. Hodgson Fowler, F.S.A., Architect, The College, Durham. Quantities may be obtained from W. Morton, Quantity Surveyor, 45, John Street, Sunderland.

March 11. **HURST (near Ashton-under-Lyne).**—Erection of a new elementary school for 150 scholars at Hurst, near Ashton-under-Lyne, for the Lancashire Education Committee. Plans may be seen and bills of quantities obtained at the office of the County Architect, Henry Littler, 16, Ribblesdale Place, Preston, by deposit of £2. Tenders must be delivered to W. F. Knott, Parish Offices, Ashton-under-Lyne.

March 12. **BUCKIE.**—Execution of mason, carpenter, slater, plaster, plumber, painter and glazier works of laundry and art class rooms at Buckie Public School, for the Rathven School Board. Plans and specifications to be seen at Buckie with R. Y. Mackay, Clerk to the School Board, to whom offers are to be sent.

March 12. **SOWERBY BRIDGE.**—Mason and bricklayer, carpenter and joiner, slater and plasterer, plumber and glazier, cast-iron and steel, concreter, and painter's work required on the erection of a 5-storey cotton mill, Walton Street, Sowerby Bridge, for Mitchell Bros., Cotton Co., Ltd. Plans may be seen and bills of quantities obtained upon application, up to March 12, to Thos. Kershaw, A.R.I.B.A., Architect, L. and Y. Bank Chambers, Halifax, to whom tenders are to be sent.

March 14. **BILSTON.**—Alterations to the assembly room and approaches at the Town Hall, Bilston, for the U.D.C. Specification and form of tender may be obtained upon application to Vincent Turner, Engineer and Surveyor, Town Hall, Bilston.

March 14. **MEXBOROUGH.**—Erection of six almshouses, and other works incidental thereto, at Church Street, Mexborough, for the U.D.C. Plans may be seen and a copy of the particulars and bills of quantities obtained at the Council offices on deposit of £1. Tenders are to be sent to G. Fenwick Carter, C.E., Surveyor to the Council, Council Offices. Fair wages clause.

March 14. **HULL.**—Erection of a school in Southcoates Lane, for the Corporation. Drawings and specification may be seen, and quantities obtained, upon deposit of £2 2s. with Joseph H. Hirst, City Architect, Town Hall, Hull. Remittances to be made payable to the City Treasurer. Tenders are to be addressed to the Secretary of Education, and delivered at the Education Offices, Hull.

March 14. **SHEFFIELD.**—Erection of new infant department for 468 places at Owler Lane Council school, for the Education Committee. Drawings and conditions of contract may be seen, and bills of quantities and forms of tender obtained, on application to the City Architect, at the Town Hall, Sheffield. Tenders to be delivered at the Education Offices, Leopold Street. Fair wages clause.

March 14. **EDINBURGH.**—Execution of mason and brickwork, carpenter and joiner, glazier, slater, plasterer, plumber, smith, and painter's work for the erection of hall and houses at Windygates for the L.O.A. Shepherds. Schedule of quantities may be obtained on deposit of £1 1s., with G. Charles Campbell, Architect and Surveyor, Methu. Offers to be lodged with Alexr. Mackie, Sec., L.O.A.S., 1, India Buildings, Edinburgh.

March 15. **NEWBRIDGE (Mon.).**—Erection of a new church at Newbridge, Mon., for the trustees of the Zoar Welsh Congregational Church. Plans and specification may be seen with John W. Aldiss, M.S.A., Architect and Surveyor, Newbridge, Mon., and bills of quantities obtained by a deposit of £1 1s.. Tenders to be sent in to Philip Parry, 19, Panteg Terrace, Newbridge, Mon.

March 16. **WOOD GREEN.**—Erection of Public Baths at Western Road, for the U.D.C. Bills of quantities, prepared by Young and Brown, with form of tender may be obtained of the Clerk on deposit of £5. Drawings and specification may be seen, on production of the receipt for the deposit, at the offices of Architect, Harold Burgess, Capel House, 62, New Broad Street, E.C. Tenders must be delivered to W. P. Harding, Clerk of the Council, Town Hall, Wood Green. Fair wages clause. Local labour to be employed.

March 16. **NORTH SHIELDS.**—Erection of North Shields Telephone Exchange, for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to the Postmaster, North Shields. Bills of quantities and forms of tender may be obtained at the under-mentioned address on deposit of £11. Tenders must be delivered to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

March 17. **ALTRINCHAM.**—Erection of a new county secondary school for boys. Bills of quantities, specification, and form of tender, may be had on application to H. Beswick, F.R.I.B.A., County Architect, Newgate Street, Chester, and plans may be seen at his office. A deposit of £2 2s. will be required. Tenders to be delivered to Jos. Howarth, Clerk to the Committee, Education Department, Market Street, Altrincham.

March 21. **WATERLOO-WITH-SEAFORTH.**—Erection of a secondary and technical school in Cambridge Road, Seaforth, for the U.D.C. Forms of tender, containing full particulars as to quantities, places, etc., may be obtained on application to Frederic Gregson, Clerk, Southend-on-Sea. Samples (if any) are to be sent to the Surveyor, H. T. Sidwell, Rayleigh, Essex.

March 7. **BARNES.**—Supply of the following for twelve months ending March 31, 1911, for the U.D.C. 1, broken Guernsey or Alderney granite; 2, broken pit flints and Thames ballast; 3, horses and carts on hire; 4, disinfectants; 5, ironmongery, etc.; 6, removal of refuse by barges; 7, Portland cement; 8, forage and litter; 9, granite kerb and channel; 10, paving slabs; 11, oils, paints, etc.; 12, stoneware pipes, etc. Particulars and forms of tender may be obtained of G. Bruce Tomes, Assoc.M.Inst.C.E., Engineer and Surveyor, The Council House, High Street, Mortlake, S.W., to whom tenders are to be sent.

March 7. **PONTYPRIDD.**—Supply of the following stores and materials for 12 months ending March 31, 1911, for the U.D.C.:—1, hauling stone; 2, granite and basalt metalling; 3, broken limestone and gravel; 4, broken pennant stone and gravel; 5, paving, kerbing, and channel stone, etc.; 6, cement and lime; 7, slates, bricks, etc.; 8, sewer pipes; 9, smith and cart work; 13, oil and colourman's sundries; 14, engineer's stores; 16, ironmongery, stores, etc.; 18, iron castings; 19, tar, macadam, stone, and gravel; 20, sand and gravel; 21, wheelwright work. Forms of tenders and specifications may be obtained on application to W. E. Lowe, Engineer and Surveyor, Municipal Buildings Pontypridd. Tenders must be received by J. Colenso Jones, Clerk to the Council, Municipal Buildings, Pontypridd.

March 8. **MALDON (Essex).**—Making-up new road in the parish of Tollesbury, for the R.D.C. Plans and specifications may be seen and forms of tender obtained of Wm. Almond, Surveyor, 6, Market Hill, Maldon, Essex, to whom tenders are to be sent.

March 8. **FAVERSHAM.**—Supply of pit flints (broken), shingle and fine gravel for roads within the district, for the R.D.C. Full particulars as to quantities, terms of contract, and form of tender, may be had on application to J. G. Chittenden, District Surveyor, Ashford Road, Faversham. Tenders to be delivered to Allan Tassell, Clerk, Faversham.

March 8. **WARDLE.**—Supply of the following materials and work for the year ending March 31, 1911, for the U.D.C.:—Broken granite, granite chippings, flags, kerbs, setts, pipes, brushes, shovels, picks, channelling, paving with setts, plumbing, and team labour. Forms of tender may be had from the Surveyor, Council Offices, Wardle, near Rochdale. Tenders and samples of materials to be sent to George Adams, Clerk to the Council.

March 9. **GLASGOW.**—Supplying whinstone metal for one year from Whitsunday, 1910, for roads in the district, comprising the parishes of West Kilpatrick, East Kilpatrick, Kirkintilloch, and Cumbernauld. Copies of the specifications may be procured from the Clerk, Hugh Hutcheson, 115, Wellington Street, Glasgow; or the Surveyor, Archibald Wilson, County Building, Dumbarton. Offers will be received by the Clerk or Surveyor.

March 9. **BRIGHTON.**—Supply of 2,400 tons of broken granite of various sizes, for the Corporation. Specification and form of tender may be obtained on application at the office of the Borough Surveyor, at the Town Hall, Brighton. Tenders to be sent to Hugo Talbot, Town Clerk, Town Hall, Brighton.

March 9. **TUTBURY.**—Supply of broken granite and limestone, for the repairs of highways, for year ending March 31, 1911, in various parishes, for the R.D.C.; also for carting the same materials. Forms of tender, containing full particulars, may be obtained from C. F. Chamberlin, Clerk, Council's Offices, Union Offices, Burton-on-Trent, or from H. S. Tebbitt, Surveyor, Rolleston, Burton-on-Trent.

March 9. **WINCANTON.**—Supply of materials (including granite, basalt, limestone, and flint), and labour for repairing the main and district roads, for three years, from March 31, 1910, for the R.D.C. Further information and forms of tender may be obtained from the District Surveyors, E. H. Knapman (Wincanton) and E. J. Haine Padfield (Cole, Bruton). Tenders to be delivered to F. W. Lancaster, Poor Law Offices, Wincanton.

March 9. **CHESTER-LE-STREET.**—Supply of the following materials for a period of twelve months, ending March 31, 1911, for the U.D.C.:—1, Northumberland whinstone; 2, broken slag; 3, broken limestone; 4, Portland cement; 5, cement concrete flags; 6, brooms and shovels; 7, sanitary pipes; 8, disinfectants. Specifications, schedules, and forms of tender may be obtained on application to Wm. Ridley, Surveyor. Tenders to be delivered to Fredk. J. Gray, Clerk, Council Chambers, Front Street, Chester-le-Street.

March 9. **SOUTH SHIELDS.**—Supply of the following materials required for the year ending March 31, 1911, for the Corporation:—Northumberland whinstone, Fifeshire whinstone, Aberdeen and Norwegian granite, slag, limestone, Caithness flags, Portland cement, cement concrete flags, cast ironwork, shovels, scavenger brooms and machine brooms, coal, disinfectants, leather hose, sewer boots, jackets, etc., sanitary pipes, paints, paint oils, glass, timber, iron, horse shoe nails, cart axles, springs, etc., tar, pitch, oils, and general stores. Specifications and forms of tender may be obtained on application to Leslie Foseveare, A.M.I.C.E., Borough Engineer and Surveyor, Chapter Row, South Shields. Tenders to be delivered to the Town Clerk, Court Buildings, South Shields.

March 12. **HUNSLET.**—Supply of highway material, including granite, limestone, dross, flags, kerbs, and setts, for the twelve months ending March 31st, 1911, for the R.D.C. Forms of tender may be obtained on application to W. B. Pindar, Clerk to the Council, Leek Street, Hunslet, Leeds, to whom tenders are to be sent.

March 12. **BELPER.**—Supply of various materials required for the maintenance of 162 miles of highways during year ending 31st March, 1911, for the R.D.C.:—Granite, 1,200 tons; furnace slag, 1,300 tons; limestone, 2,000 tons; also carting the same in the different parishes. Specification and form of tender may be obtained upon application to Robert C. Cordon, Engineer and Surveyor, Duffield, near Derby.

March 12. **COVENTRY.**—Supply and delivery of the following materials during the year ending March 31, 1911, for the Corporation:—Broken road stone, granite kerbs, granite setts, stoneware pipes, castings, workmen's tools. Forms of tender and full particulars may be obtained and samples inspected on application to J. E. Swindlehurst, M.Inst.C.E., City Engineer and Surveyor, Saint Mary's Hall, to whom tenders are to be sent.

March 12. **BURNLEY.**—Supply of the following materials for the twelve months ending March 31, 1911, for the R.D.C.:—(1) Broken granite macadam, (2) broken limestone, (3) shovels and spades, (4) scavengers' brooms, (5) disinfectants, (6) earthenware sewer pipes. Forms of tender and schedule of quantities and stations for delivery may be obtained on application to H. Pritchard, Acting Surveyor, 18, Nicholas Street, Burnley. Tenders to be delivered to J. S. Horn, Clerk to the Council, 18, Nicholas Street, Burnley.

March 14. **STREATHAM.**—Making-up and paving Penwortham Road, Streatham, for the Corporation of Wandsworth. Specifications and drawings may be seen, and forms of tender obtained, at 56, East Hill, Wandsworth, S.W., upon deposit of £5 5s. Tenders must be delivered at the Council House, East Hill, Wandsworth, S.W. Fair wages clause.

March 14. **LEEDS.**—Paving and flagging the following private streets, for the Corporation:—Burton Avenue (part), Fairford Avenue, Fairford Terrace, Primrose Lane, Longroyd Street, Longroyd Place, Longroyd Grove, Back Longroyd Terrace, Roseville Street, and Ivy Grove; also paving and flagging improvement in Low Road. Drawings may be seen at the City Engineer's Office, Municipal Buildings. Forms of tender and bills of quantities may be obtained and copies of documents inspected on application at the Highways Office, 155, Kirkstall Road, Leeds. Tenders must be delivered at the Town Clerk's Office, Town Hall, Leeds.

March 15. **BRISTOL.**—Construction of a new road, about 800 yards in length, in the parishes of Nempnett and Winford, for the Clutton R.D.C. Specification on application to the Council's Surveyor (T. Orchard, The Grange, Haliatrow, near Bristol), by deposit of £1 1s. Tenders must be sent to J. Sumner Dury, the Clerk to the Council, Temple Cloud, near Bristol. For further information apply to the Surveyor.

March 16. **EASINGWOLD.**—Supplying whinstone, slag, etc., according to order, stating price per ton for unbroken, machine broken, and hand broken (the broken to be supplied in cubes small enough to pass through a 2½in. ring) for which the same will be delivered free at the various railway stations, for the R.D.C. Tenders must be sent to F. I. H. Robinson, Clerk, Easingwold.

March 16. **MIDDLESEX.**—Supply of about 12,000 tons (more or less) of 2in. and 1½in. basalt or granite; 2,000 tons (more or less) of ½in. chippings, to be delivered free to various stations in Middlesex, for the C.C. Particulars, with specification and form of tender, may be obtained of H. T. Wakeham, M.Inst.C.E., County Engineer and Surveyor, Middlesex Guildhall, Westminster, S.W. Tenders must be sent to the Clerk of the County Council, Middlesex Guildhall, Westminster, S.W.

March 16. **MIDDLESEX.**—Cartage of about 12,000 tons (more or less) of broken stone, 2,000 tons of chippings, and about 4,000 tons (more or less) of gravel, from various railway stations and local pits in the districts of Barnet, Bedfont, Cowley, Cranford, Edgware, Enfield, Hampton, Harlington, Harmondsworth, Harrow, Hayes, Hillingdon, Potter's Bar, Southall, Stanmore, Wembley, and Wood Green, for the C.C. Particulars and forms of tender may be otained of H. T. Wakeham, M.I.C.E., County Engineer and Surveyor, Middlesex Guildhall, Westminster, S.W. Tenders must be sent to the Clerk of the County Council, Middlesex Guildhall, Westminster.

March 18. **EASTRY.**—Supply and delivery of surface and approved dry flints on the various roads in the district and recarting stones from depots. Also for steam rolling with ten ton rollers, for the R.D.C. Forms and tenders and schedules of quantities may be obtained of the District Surveyor, D. E. Foster, Hazel Bank, Eastry, Dover, or the Assistant Surveyor, W. Goodsell, Durlock Road, Ash, Dover. Tenders must be delivered to F. S. Cloke, Clerk to the Council.

MISCELLANEOUS.

March 5. **WARRINGTON.**—Supply of the following materials for a period of twelve months, from April 1, for the Corporation:—1, cast-iron pipes, valves, and cast-iron surface boxes; 2, bib, stop and ball cocks, and ferrule couplings; 3, cylinder and engine oils; 4, carting. Deposit of 10s. per section is required. Further particulars may be obtained from James Gray, Engineer, Municipal Offices, Warrington.

March 7. **CAMBRIDGE.**—Supply of the following materials and goods for one year from April 1, for the U.D.C.:—(1) Timber, British and foreign; (2) stoneware pipes and fittings; (3) Portland cement; (4) gravel, sand, etc.; (5) brooms, etc.; (6) paint, etc. Specifications may be seen, and forms of tender obtained at the office of the Borough Surveyor, Guildhall, Cambridge. Tenders should be delivered to J. E. L. Whitehead, Town Clerk, Guildhall, Cambridge.

March 8. **LONDON, E.**—Execution of plastering work in the "E and F" ward at the sick asylum, Devons Road, Bromley-by-Bow, London, E., for the managers of Poplar and Stepney Sick Asylum District. Forms of tender, with all particulars, together with copies of specification, may be obtained on application to the Engineer and Superintendent of Labour at the Asylum. Tenders must be delivered to Walter R. Foskett. Clerk to the Board, Clerk's Office, Devons Road, Bromley-by-Bow, London, E.

March 14. **EASTRY.**—Execution of the following works:—Carpenters, glaziers, tin-plate workers, etc., for the Union, for one year, from March 29, 1910. Offers to tender should be sent through the Post-Office, at the Union Workhouse, Eastry, where forms of tender may be obtained. Tenders must be forwarded to Fred. S. Cloke, Clerk, Sandwich.

March 16. **NEWCASTLE-UPON-TYNE.**—Supply of the undermentioned materials during 12 months ending March 31, 1911, for the Corporation:—1, bricks; 2, carbolic acid; 3, cement; 4, clot lime; 5, flags, (artificial), 6, flags (Caithness); 7, flags (freestone); 8, gulley grates ventilator covers, etc.; 9, hosepipes; 10, iron, steel, and horse shoe nails; 11, kerbstones; 12, leather; 13, lead washings; 14, oils and paints; 15, pitch tar and creosote oil; 16, privy pans and ashbins; 17, road stones; 18, sanitary pipes; 19, scavenging brooms, etc.; 20, shovels; 21, timber. Forms of tender may be obtained on application at the City Engineer's Office, Town Hall. Tenders must be left at the Committee Clerk's Office, Town Hall.

Dignity of Decay.

With the pulling down of the old Royal Infirmary, a well-known landmark disappears from the centre of Manchester. As the writer passed it a day or so ago, the only part left standing was the group of pillars which supported the central pediment and their surmounting frieze, which stood up boldly silhouetted against a gloomy rain-dropping sky, and, for the first time in our recollection of the building, produced an imposing effect, and seemed to convey a mute and dignified protest against the destructiveness of man. When the body of the building lay behind them, smoke-grimed as it was, the impression was simply gloomy and uninteresting; but with the sky as a background, the tall pillars and the frieze connecting them reminded one of some relic of a mightier past. The thought came that perhaps much of the beauty and interest of ancient classical ruins is due to a similar cause, and that had we the whole buildings before us in their pristine condition they would be much less impressive. Imagine how grand the great pillars and frieze of the front of St. Peter's at Rome would look if they were all that was left of the huge edifice to which they form the entrance; and imagine how much of interest the Venus of Milo would have lost if she had come down to us with her arms perfect!

Design and Size.

A common foible of architects (or perhaps of their clients) is hit by a writer in an American contemporary when he remarks that "it is a very comfortable thing to see a village hospital that does not look like a child's-size imitation of a city one." The remark is of fairly general application. In our own country, however, the rural hospital does not usually come under the implied condemnation. The so-called cottage hospital usually has quite a distinctive character of its own, and is by no means a miniature St. Thomas's or "Bart's." On the other hand, one has often to deplore the small library, or town hall, or church, or suburban villa that is palpably and grossly out of scale, and miserably fails to please because it so strongly suggests the frog trying to inflate himself to the dimensions of a bull. No doubt the architect often perpetrates these monstrosities at the urgent demand of the client; the former well knowing the important relationship between design and size. Another matter in which the architect of small buildings is often hampered and embarrassed is that of the sizes of materials, mainly decorative. He finds that the particular detail he requires is made in only one size, which may be appropriate for a mansion, but is too large for a villa. Manufacturers should make a note of this. In some instances it might be possible for them to standardize their materials in the same way that printers standardize their types, one size bearing a definite proportional relationship to another, so that, occasionally, the various sizes could be used in conjunction. This, however, is a separate matter from suiting the design to the size.

Cheaper School Construction.

Mr. Walter Runciman, President of the Board of Education, has been much impressed with the great cost of erecting school buildings in accordance with modern standards of suitability and convenience, and has appointed a committee, consisting of three members only, with instructions to proceed on strictly practical lines to consider and report on the possibility of effecting substantial savings in the cost of construction by the adoption of new methods and new materials, as to what steps should be taken to facilitate their adoption, and whether any alteration in the law is required for the purpose. The Committee will sit and receive evidence immediately, at the Office of the Board of Education. This announcement merits the serious attention of practical builders. There is now, we understand, a more liberal construction placed upon the rules of the Local Government Board in regard to the distinction to be drawn between (1) temporary and (2) permanent buildings. Such of the former class as may be reasonably expected to last over twenty years are to be admitted as candidates for the permanent class, and local authorities may obtain dispensation from the Local Government Board in regard to by-laws affecting their erection. Therefore the time seems ripe for inventive minds to turn their attention to more economical methods of construction for schools, workmen's dwellings, and certain kinds of factories. The chief difficulty in the way of successfully carrying out garden city and town planning schemes lies in the difference between the number of buildings per acre in such schemes, as compared with the present method of crowding the land with as many buildings as possible. The necessarily enhanced cost of the land in the former cases will need to be offset by serious reduction of the cost of the buildings themselves, if investments of the kind contemplated are to be a commercial success, and not merely an expensive fad. The fact that the buildings in such cases may stand comparatively isolated favours the adoption of cheaper methods of construction; and the many new ideas now on the market for cheap construction offer a wide choice of suggestions which can either be adapted to the present purpose, or which will suggest analogous developments in other materials. Brick and tile makers might possibly find in this direction some compensation for the loss of trade which will doubtless result from the extensive adoption of reinforced concrete construction which is going on.

School Architecture.

The announcement that the President of the Board of Education has appointed a Departmental Committee to enquire "Whether the cost of buildings for public elementary schools can properly, and with due regard to their suitability and durability, be reduced by the use of materials or methods of construction different from those ordinarily employed at present," will, however, be received with mixed feelings by architects generally. The design of such buildings has, in the past, been greatly hampered by considerations of cost, incurred, on the one hand, in carrying out the necessary educational and hygienic requirements of the Board of Education, and limited, on the other hand, by the not unnatural desire of the education authorities to curb the expense as far as possible. Between the Scylla of an irreducible minimum and the Charybdis of a rigid maximum, the architects of school buildings have by no means an enviable lot, and in the majority of cases are forced to achieve their effects with the simplest materials arranged in the simplest forms. This would matter less from the point of view of civic design if school buildings were not so frequently placed in conspicuous positions, where architectural treatment is essential. And by this we do not mean elaborate ornament. But if the money at the architect's disposal only allows him to build plain brick sheds, from which mouldings and all other reliefs have to be rigidly excluded, it can hardly be said that the architect is afforded a fair opportunity

either for exhibiting his skill or for contributing to the town's amenities. It does not appear from the terms of reference to the committee that the wisdom or otherwise of many of the structural requirements of the Board of Education are to come under consideration; but many architects, we fancy, could give interesting evidence on this head. We do not say that there are no openings for economy in the building of schools, or that unnecessarily extravagant buildings have not, in the past, been erected; but we think the terms of reference are too confined, and that the whole subject is one that should be enquired into. No doubt cheaper buildings could be designed in materials not generally employed for schools, but yet capable of proper architectural treatment. But it must not be forgotten that authorities usually borrow funds from another Government department to erect these schools; and, bearing in mind that same department's attitude to reinforced concrete, it hardly seems likely that the period over which the repayments are extended will be as long for new materials as for the materials now more usually employed.

A Unique Topographical Collection.

The "Gardner Collection," which is perhaps the finest assemblage of topographical prints and drawings ever got together in illustration of old London, is about to be offered for sale by auction, and is therefore in danger of dispersal. The collection comprises nearly 60,000 items, which include, besides views of streets, palaces, and interesting houses, illustrations of interiors, and of architectural details; among them being, for instance, a portfolio of magnificent drawings by William Capon of fine mediæval decoration and tapestries of the old royal palaces of Westminster, of which Westminster Hall is almost the sole remaining part. As the "Connoisseur" urges in a justifiably vehement appeal, this collection certainly ought to be acquired by the nation. Its acquisition would no doubt be costly; but there is a sense in which its treasures are priceless, because, as our contemporary says, "London is the head that planned, the nerve centre that directed, the events that have built up this great empire; and in these pictures are gathered together all that is known, almost all that can be known of the actual life and appearance of this great city from the time it became the Londinium of Imperial Rome to the dying out of the Hanoverian dynasty." The interest of such a collection being of necessity largely architectural, we very gladly support the suggestion that the Gardner treasures should be promptly purchased by the Government, by the Corporation of the City of London, or by the London County Council. The appeal to the Government being ill-timed during the present financial chaos, and the L.C.C. being apparently in no mood for heavy expenditure, it remains for the wealthy City Corporation, or for one or other or a combination of the richer of the City Companies, to seize this splendid opportunity of enriching the public archives, and of sparing us the ignominy and chagrin of an irreparable loss.

Town-Planning Pioneers.

It is gratifying to observe that town-planning problems of the simpler sort are beginning to exercise the minds of the more thoughtful and more influential sections of the community. The matter has come to be regarded by the lay Press as an interesting topic, and those who have anything to communicate upon the subject can pretty safely reckon on the hospitality of the local newspaper. The floodgates, however, are not yet loosed, and the deluge of nonsense that may be looked for as the natural concomitant of a great new movement has not yet appeared in sufficient force and volume to swamp the field. Before it comes, architects, and others possessing authentic credentials, will do well to make the most of their opportunities for conveying instruction and enlisting sympathy. In doing this, they should set to work warily and tentatively, bearing in mind that they will probably be opposed by many reactionary forces, not the least potent of which is the obstinacy of crass ignorance; and the more that can be done, in every conceivable way, in season and out of season, to render the big idea more familiar and less terrifying, the swifter will be the progress made in the right direction. We notice that much—perhaps a disproportionate amount—of this pioneering or missionary work is being done by city engineers, and similar functionaries. While recognising the value of their aid, and while welcoming, we hope in the most catholic spirit, every well-directed effort towards the goal of our desires, we nevertheless urge the architects not to let the engineers have too much of their own way in a matter in which the æsthetic aspect is in need of particular insistence.

Strength and Beauty.

It must not be inferred that we have the least desire to set the architect and the engineer in opposition. There are obviously very many town-planning matters in which they can advantageously combine—in which, indeed, the mutual aid they can render each other is indispensable. The danger that we fear is that the public mind, impressed by the activity and conspicuousness of the engineer, may imbibe the erroneous idea that town planning is chiefly a matter of engineering. The prevalence of this notion would be most injurious, if not absolutely fatal, to the æsthetic interest. In administering the Act, it is all-important that the influence of the architect should preponderate from the beginning. We do not want an engineering lay-out with architectural addenda. We want the architectural interest to inform and inspire the entire scheme—to be vital and organic, not superficially decorative—to be an essential and all-pervading force. There is, however, one respect in which the influence of the engineer should be highly beneficial. He is accustomed to bigness of ideas—to take extensive surveys, and to counsel the adoption of heroic measures. The public are familiar with his audacity, and will tolerate it from him; whereas any suggestion of gigantic operations and huge expense coming from an architect—who in making such proposals would be assuming an unaccustomed rôle—might meet with opposition from those who associate him too intimately with the day of small things. This tradition he might find it difficult to overcome without the moral and material support of the engineer, whom the public regard as a chartered spendthrift, entitled to think in miles and millions, and not lightly to be deterred from his colossal purposes. The object should be, therefore, not to oppose him, but to enlist him on our side, so as to get an ideal union of strength and beauty.

THE GARDNER COLLECTION.

Its Threatened Sale and Dispersal.

From time to time disturbing notices appear in the Press concerning the impending sale and consequent dispersal of "the Gardner Collection." Such a fate would be an irreparable loss to the nation and particularly to London. As "the Gardner Collection" is probably but a name to many of our readers, it may be as well to state that it is a collection of prints and drawings, but of prints and drawings which not only possess their appraisable and intrinsic value as rarities and works of art, which cannot be taken away from them; but, what is of far more importance and beyond any price, they present the most astounding, marvellous, and unique collection of records of vanished and vanishing London.

The collection comprises, in fact, nearly if not quite 60,000 prints and drawings illustrative of Old London, its history and topography, its streets and palaces; famous, curious and interesting houses; and what is more, of their interiors, architectural details, decoration, carving, furniture, and the portraits of celebrities who lived in them. To realise, says a writer in "The Connoisseur" for February. its amazing wealth, let us compare it, for a moment, with the famous Crace and Croll collections of the British Museum. To begin with, in the former there are fewer than 7,000 delineations against the 60,000 of the Gardner collection, and, moreover, it is destitute of the interiors, the decorations, the portraits, and all the *genre* pictures which make the "Gardner" such a vivid and realistic pictorial epitome of London's past; the second great collection, the Croll, contains but 5,500 illustrations.

At present the Gardner collection still reposes in the 110 massive portfolios of "royal" size, each on its appointed shelf in the long gallery or library, planned and built expressly for its reception by the far-sighted antiquary and artist who created it. The gallery lighted by large oriel windows of carved stone filled with antique Swiss and German painted glass, panelled with old oak, and appropriately adorned with mediæval curios, arms and weapons, was a fit casket for such a treasure, insured more than thirty years ago for £20,000. Its value to-day is hard to estimate, but to exhibit it 36,000 feet, or not far short of an acre of wall space, would be needed. No living person has examined it all through, and merely to catalogue it for sale must still occupy many months.

We feel sure that all readers will join in the efforts that are being made to secure this unique collection for the public and save it from dispersal in the sale room.

THE ROYAL ACADEMY, 1910.

Receiving Days.

The receiving days for the various classes of works this year are as follows:—

Water Colours, Pastels, Miniatures, Black and White Drawings, Engravings, and Architectural Drawings, Thursday, March 24; Oil Paintings, Saturday, March 26, and Tuesday, March 29; Sculpture, Wednesday, March 30.

No artist is allowed to send more than three different works.

All works must be delivered at the Burlington Gardens entrance. None will be received at the Piccadilly entrance.

Hours for the reception of works, 7 a.m. to 10 p.m.

Forms and Labels can be procured (during the month of March only) from the Academy. Applications for them made by letter must be accompanied by a stamped and addressed envelope.

As in former years, we shall be happy to undertake for readers the delivery of architectural drawings to Burlington House, on condition that we are allowed to reproduce same while in our hands. All drawings for delivery must reach us not later than 4 p.m. on Wednesday, March 23rd.

Carpenters' Hall Lectures.

"THE ART OF THE PLASTERER."

On Wednesday, Feb. 23rd, at the Carpenters' Hall, London Wall, E.C., "The Plasterer's Art" was dealt with by Mr. George P. Bankart. At the outset, he proposed, he said, to draw attention to the influence of materials both on old work and modern plaster work. This influence is much overlooked at the present day, and is responsible for a good deal of indifferent work.

Plastering a Native Art.

He showed that the art of the plasterer in this country was a native art, quite distinct from any other, and he contended that it should be so again. The plasterwork was carried out everywhere by native plasterers or "daubers," as they were called, in a quite natural and ordinary way, and there is every reason to believe that the plasterer of the future will cultivate the art of these traditional methods. Plasterwork he classified under four heads:— (1) Stucco Duro, (2) Parge work, (3) Plaster of Paris, (4) Modern Fibrous Plasterwork, and discussed the possibilities of each kind of work. Each kind of material has its distinct decorative character, due to different methods of working. It is this confusion of styles and materials that is responsible for much of the inferior plaster decoration of recent years.

Stucco Duro.

This material used by the Italians was rediscovered in the 16th century. It is composed of sand, lime, and marble dust, and through the thorough burning of the lime possesses a smooth and buttery nature. Some slides were shown of examples from the Via Latina, Rome, executed about the first half of the first century A.D. Its chief virtues were its extreme hardness and durability, and smooth surface. It has never been surpassed for simplicity of design, subtlety of modelling, and excellence of execution. Slides were shown from examples in the British Museum and South Kensington, in which could be plainly seen the markings of the steel tool with which the modelling was carried out. The great painter, Raphael, and a little band of pupils, trained the plasterers of Italy in the art of Stucco Duro, and, encouraged by the Church, spread all over Italy and to the palace of the French King. In the reign of Henry VIII., a body of men came over to England and modelled Nonsuch House. The great beauty of this stucco was that work could be carried out in it in high and low relief. In England the art only survived for a short time, and that in the hands of Italians. Some slides were shown of work at Hardwicke Hall, now in ruins, executed by Charles Williams, and also of work at the present Hardwicke Hall carried out by a band of plasterers trained by Charles Williams, not quite so pure as his work, but good. These Italians taught the English plasterer how to make and use this plaster.

Parge Work.

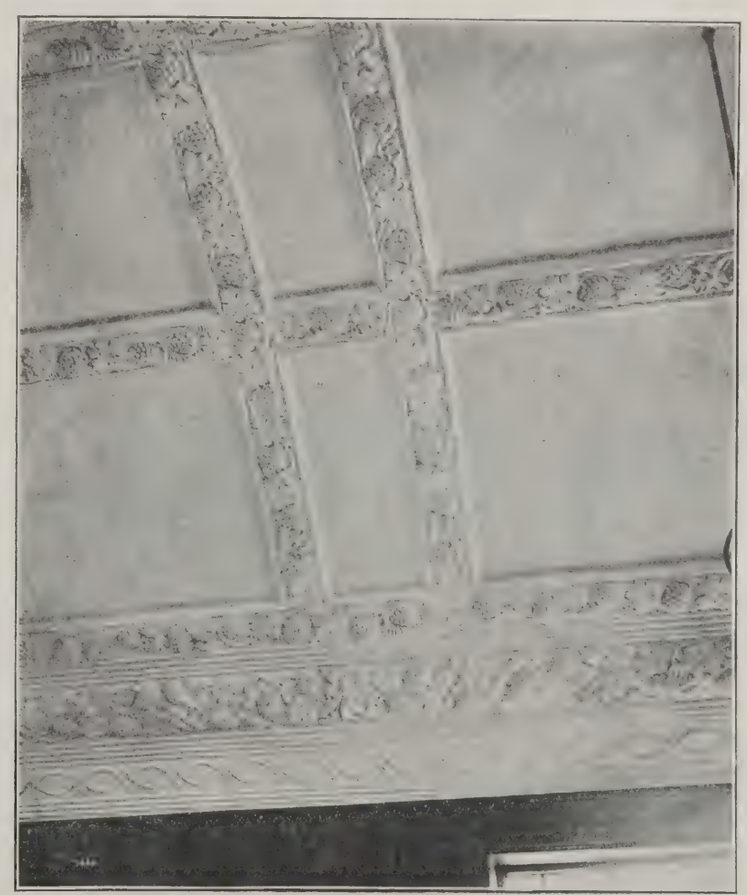
Native parge work was very tough and weather-proof. This parge work could be done by the village plasterer and his sons in their own particular villages, and the work changes within a certain radius of the districts within which they worked. They had their own districts and their own patterns, which varied from time to time. The work was modelled direct on the job with a trowel. Some is combed into a herring-bone pattern, scallop, or wavy line. Inside the building there may be a simple modelled frieze, or perhaps an overmantel. Two examples of the latter were shown from simple yeomen's cottages at Barnstaple, and there are hundreds of others in Devonshire and North Somerset.

Panelled Ceilings.

The ceiling was panelled with mouldings lying into splays. The moulded ribs consisted chiefly of simple rounded forms. Sometimes the pattern radiated from a centre; and where the panel moulds intersected, there was placed a boss of plaster. The panels were often occupied with crests, monograms, heraldic bearings, etc. After the simple panel mould came gradually, a double moulding, in the time of Queen Elizabeth, when courtiers were vying with one another in the grandeur of their staircases, their tapestries, etc., and these mouldings grew gradually more elaborate and with decoration between. Some slides were shown of the ceiling from the long gallery at Knole, very simple in design, and characteristic of the period, and distinctive English work. A centre flower of this period was shown, which, the lecturer said, will compare with those of the Victorian period, and show the difference between plaster and cast iron. In the Early Jacobean period a quarter of the ceiling contained the pattern which was doubled over and then over again, so that the whole ceiling was covered with a most irritating repetition.

Foreign Influence.

Shortly after this when Inigo Jones had been to Italy and Christopher Wren to France, we get stucco of another form, very deeply undercut and casting deep shadows full of life and colour. The greater part of the work was modelled direct *in situ*, with a small tool, by Italian plasterers, assisted by native workmen. This is very fine when done in the right material, but cannot be reproduced in plaster of Paris. After this period of Stucco Duro work in England by Italian workmen and when Wren went to France, was the beginning of the end of English plasterwork. Stucco Duro was now carried out in the French style by Dutch artists. Vanbrugh, Hawksmoor, Archer and others tried to model plasterwork on orthodox lines. Gradually plasterwork died down, except for the last dying flicker during the time of the Adam brothers.



Then we come to that ghastly period in which London streets were lined with rows of houses in that hideous stuff called stucco (not duro). We will pass over this period of disease, and consider present-day materials.

Present-day Practice.

We have Keene's cement, Portland cement, also grit plaster, with which we coat our walls and ceilings, which is not as it should be. This is usually due to the unslaked condition of the lime. Speaking of the difference between plaster of Paris and Stucco Duro, Mr. Bankart said that the difference between the qualities of the two materials and the two processes must be obvious to anyone. Architects want this kind of work, and ask for it, but it can never be done until Stucco Duro is again forthcoming. A ceiling from a sitting room at Groombridge Place exhibited details as thin as paper yet as hard as flint, but it could not have been cast, because the undercutting is so deep. You cannot get from a material technical qualities which it does not possess. Plaster of Paris or sulphate of lime is very soft, and has no sharp edges, it is capable of excellent decorative results, but must have soft treatment; Stucco Duro was an extremely smooth and butter-like substance when moist, but, set hard as flint, could be used as thin as a rose petal, and with edges sharp as a knife. It was looked upon for some time as carving, but there was no carving in it.

Imitation Plasterwork.

The imitation work is carving. Something will have to be done to remedy this, by an arrangement between the architects and the builders. Until then the question is to find a substitute for this kind of work. Examples were shown in which the flowers, leaves, etc., had been modelled in Keene's

THE ART OF THE PLASTERER: CEILING, MILL HILL SCHOOL LIBRARY, BY GEO. P. BANKART.

THE ART OF THE PLASTERER: PANEL FOR WALL DECORATION: PART OF A SCHEME BY STEPHEN WEBB.

cement, and then placed in a hollow ground in the ceiling specially prepared for them by skilled workmen.

Good Modern Work.

Many people think that good modern plasterwork is a forlorn hope. This pessimism is always injurious to a good cause. Good work is being done by modern journeymen plasterers at the present day. Several delightful examples of modern plasterwork were shown, including some charming bedroom ceilings, one done by an Edinburgh plasterer from rough sketches. In these the modelling of the stems, etc., to the flowers was done on the ceiling itself, the flowers and leaves being cast and stuck on. Now we come to another process, that of drawing out the design on the finished coat of Keene's cement, and then working on just so large a space as can be kept wet for one day.

Fibrous Plaster.

Fibrous plaster is a modern process, and one entirely owing to the development of iron and steel construction of our buildings. It is composed of plaster of Paris, canvas, and wood, and has apparently come to stay. Most important of all, it is expeditiously manufactured and fixed by a skilled workman.

Now, Mr. Bankart said in conclusion, I would like to say a few words to the younger plasterers, to appeal to the inner natures of improvers and apprentices. I have not come here to find fault with the modern plasterer. As a mechanic he is excellent, but mechanically and often unconsciously he wipes out qualities from work which might be its beautiful qualities. We have seen past work and modern work, and let me say here that there is any amount of talent among the plasterers of the present day. In old work there was plenty of reserve and restraint, which came from natural causes. Learn from the simplest and purest examples what was done in the past, for what men have done in the past can be done to-day. Find out the beautiful qualities which are possible in the material. Train yourself to appreciate scale. The instinct depends upon a man's natural endowments. The art is in him, and must be developed. Learn from old stuff, use your fingers, your sketch-books, and your cameras, and don't be content to exist mechanically only.

THE COST OF SCHOOL BUILDINGS.

Departmental Committee.

Mr. Runciman, President of the Board of Education, has appointed a Departmental Committe to inquire and report:—

(a) Whether the cost of buildings for public elementary schools can properly, and with due regard to their suitability and durability, be reduced by the use of materials or methods of construction different from those ordinarily employed at present; and, if so,

(b) What steps should be taken to facilitate the adoption of such materials or methods, and whether any alteration in the law is required for the purpose.

The committee is composed of:—

Chairman, Mr. L. A. Selby-Bigge, C.B., Principal Assistant Secretary of the Elementary Education Branch of the Board of Education.

Mr. N. T. Kershaw, C.B., Assistant Secretary of the Local Government Board.

Mr. F. Clay, Architect of the Board of Education; with

Mr. J. G. Milne, Senior Examiner of the Board of Education, as secretary.

The committee will sit and receive evidence immediately at the office of the Board of Education, and their procedings will be conducted with a view to reporting as soon as possible. The matter is referred to in our leaders this week.

EXHIBITION OF APPRENTICES' WORK.

An exhibition of apprentices' work, organised by the Apprenticeship and Skilled Employment Association, is being held in the Drapers' Hall, Throgmorton Street, through the courtesy of the Drapers' Company. At the opening ceremony, which was performed by the Lord Mayor, Lord Henry Bentinck, who presided, said the fact was now recognised that there was nowadays a large amount of unemployment among young people, whereas formerly it was mostly old people who suffered from unemployment; and the work of the association was to show

them how to enter skilled trades and avoid "blind-alley" employments; this was followed up by supervision to see that the young people were duly apprenticed and properly instructed. Efforts were also made to remove the apathy of parents on the subject.

The Lord Mayor said he would like to see the old system of apprenticeship revived, and an Act of Parliament passed requiring every young person to learn a trade.

Sir Melvill Beachcroft, chairman of the L.C.C., said that efforts had been made for more than thirty years to provide technical instruction for the youth of London, and that there were now some 32 secondary schools maintained for such instruction. He feared that a revival of the old system of apprenticeship might not be practicable, and, if not, the next best thing would be technical instruction combined with workshop instruction. He also urged the need for the introduction of new industries into London, so as to widen the opportunities for employment.

Mr. Cyril Jackson, chairman of the Education Committee of the L.C.C., expressed the hope that the existing voluntary organisations comprising the Apprenticeship Association would not find themselves superfluous in consequence of the Government taking up the question of finding apprentice employment through the Labour Exchanges, because boys and girls would still need supervision to help, both during and after their apprenticeship, and he thought there was scope in such work for valuable co-operation on the part of these voluntary associations.

The exhibition consisted of examples of apprentices' work in the needlework, jewellery, and silversmithing, designing, printing and binding, building, furnishing, coach and barge building, engineering, instrument-making, leather and miscellaneous trades, about 575 exhibits in all. In the building class there were about 40 exhibits. The chief impression produced was that there is a mine of ability among the youth of both sexes in this metropolis, which should well repay any encouragement and development that can be given.

It is anticipated that the Irving Memorial will be completed by the end of June or the beginning of July. Sir John Hare has consented to perform the ceremony of unveiling.

Societies' Reports.

Northern Architectural Association.

At a students' meeting of this association held on the 23rd February, 1910, Mr. Wm. Milburn, jun., A.R.I.B.A., read a paper on the Continental Hospitals, which he had visited during his tour as the Saxon Snell Prizeman of the Royal Institute of British Architects for 1908. It was pointed out that the large majority of these institutions are constructed, equipped and maintained by the municipalities, and that the greatest study and attention are devoted to their design and construction, so as to keep step with the strides which are being made in the domain of medical science and skill. The sites for these hospitals are whenever possible situated on the outskirts of the cities, so as to obtain pure air, ample space and freedom from noise and dirt, a very large proportion of the site being laid out as parks and gardens.

In describing the general arrangement and disposition of the buildings on the site, Mr. Milburn referred to the Eppendorf Hospital, Hamburg, one of the most celebrated of Continental hospitals, which is planned on the pavilion system, and now comprises over 100 separate buildings, of which 85 are used for the reception of the sick, and are arranged in separate departments for medical, surgical, tuberculosis, infectious diseases, maternity, ophthalmic and epidemic cases. The Rudolf Virchow Hospital, Berlin, also constructed on the pavilion system, which was opened in 1906 with an accommodation for 2,000 patients, and is in many respects the finest hospital in the world, was also fully described. Owing to the great area covered by these hospitals, and the difficulties of transporting the patients to and from the operation house, and the conduct of food and general services in wet and stormy weather, many of the recent German hospitals are adopting the plan of linking up the separate buildings by closed corridors, and constructing wards of two and more stories in height. In dealing with the design and planning of the pavilions, the double pavilion type with two large wards, as at the Virchow Hospital, which has succeeded the Eppendorf type with one large ward, was described and the points of difference in the wards and adjoining rooms for medical, surgical, children, maternity, insane or infectious cases were discussed. The Operation Houses, as at St. Georg, Hamburg and Dusseldorf, which, owing to the great advances in surgery and the use of antiseptic and aseptic methods are among the most interesting of the buildings in the Continental hospitals, were fully described. Special note was made of the heating, which is remarkable, the whole of the theatres being surrounded by what is termed a "mantle" of hot air, in order to raise the temperature much above the normal, which is necessary for many operations. The bath-houses are among the most interesting of the buildings in these institutions, and the cooling and massage rooms, the hydropathic, electrical, hydro-electrical, cabinet, Turkish, steam, carbonic acid gas, sand, and permanent baths, and the medical gymnasium for the orthopædic surgery, were all fully described, and the pathological departments, lecture theatre, dissecting rooms and animal houses illustrated. Referring to the Administrative and Domestic blocks, it was shown how in most cases the kitchens and stores' departments are entirely separated from the officer and admission department. The paper, which was illustrated by over 80 lantern slides, concluded with a description of the systems of heating, ventilation, lighting, drainage and sewage disinfection employed.

The Institution of Municipal Engineers.

At a meeting of the Council of the Institution, held at 39, Victoria Street, London, S.W., on Wednesday, February 23, 10 applicants were elected to membership and 1 to studentship. One student was transferred to the member class. The roll of the Institution now stands at 697 members and 96 students, making a total of 793.

Examinations Committee.—This committee presented its report, which it was decided to refer to a committee of the whole Council (and of the non-Council members of the original committee) to consider the arrangements for the appointment, duties and remuneration (if any) of the proposed Board of Examiners.

Revision of By-Laws Committee.—A draft of the proposed amended by-laws was pre-

sented by this committee, and the secretary was instructed to call a special Council meeting for its consideration, prior to submission to the members of the Institution.

Surveyors' Institution Meeting.—The Secretary reported that at the Surveyors' Institution, 12, Great George Street, Westminster, on Monday next, at 7 o'clock, a paper, "Prospects in Municipal Surveying," was to be read by Mr. Edgar A. Rogers, and that an invitation to attend and discuss the paper had been extended to members and students of the Institution.

Birmingham Clerk of Works and Builders' Foreman's Association.

A lecture was given recently at the Midland Institute to the members and friends of the above association by Mr. Guy Pemberton upon "The Cotswolds," By means of a series of excellent lantern slides, the lecturer illustrated the beauties both natural and architectural of that picturesque and old-world district, and at the same time pointed out the peculiarities of the methods of building and the unusual uses made of the local materials. The lecturer, who has made extensive tours and carefully studied the characteristics of the district pointed out the objects of historic, architectural and general interest to be found in such well known old Gloucestershire villages as Winchcombe, Chipping Campden, Broadway, Bibury, etc., where such stirring and epoch-making scenes took place during the Wars of Cromwell, and mentioned that these villages have been described by Mr. Guy Dawber in his book, "Cotswold Cottages," and by Mr. Duckworth in his interesting work, "The Cotswolds." At the conclusion of the lecture, a vote of thanks was accorded to Mr. Pemberton, who, in reply, said that he hoped the interest which has lately been aroused among the public generally, and among the lovers of English beauty and Elizabethan architecture in particular by Mr. Dawber, Mr. Duckworth, and others in this picturesque and most interesting corner of England will not be allowed to fade, but will be maintained and increased by architectural, archæological, photographic, and such-like societies, so that the present beauties may be preserved and not ruthlessly destroyed by modern "renovations," which has already, in some cases, been done.

Gloucestershire Architectural Association.

A meeting of this association was held in Gloucester on Thursday evening, the president (Mr. H. W. Chatters) being in the chair, and members present included Messrs. W. B. Wood, J. F. Trew, E. A. Pryer, A. H. Smithson, T. Malvern, S. H. Healing, W. J. Jones, R. Phillips, H. S. Davis, W. J. Knight, D. R. Lyne, S. W. Thurston, W. E. James, and T. Overbury (hon. secretary), and several visitors. A paper was read by Mr. Mowbray Green, F.R.I.B.A., of Bath, entitled "The 18th Century Architecture of Bath," which dealt most fully with the growth of that city from A.D. 1550 to the close of the 18th century, the works of John Strahan, John Wood and his son, Thomas Baldwin, and Robert Adam, being treated in detail. The lecture was illustrated by a splendid selection of lantern views, showing many works of each architect, and in several instances the photographic slides gave the original drawings of the designer as well as the finished work, which proved very interesting. The views of Prior Park, that fine mansion built to advertise the Bath stone, were especially beautiful, as also were the series of staircases and interiors. On the proposition of the president, seconded by Mr. R. Phillips, a vote of thanks was enthusiastically passed to Mr. Green for his paper.

Glasgow and West of Scotland Technical College Architectural Craftsmen's Society.

Mr. James Flett presided at the regular meeting of this society last Friday week, 25th ultimo, when Mr. Geo. U. Watson delivered a paper entitled "Excavations and Timbering." He divided his matter under three headings: (1) Open cut, (2) tunnelling without air pressure, and (3) tunnelling with air pressure. The first method was generally adopted for sewers 12 to 20ft. deep. Reference was made to essential points in this method, such as nature of ground, scantling of timber used, and the method of timbering to be adopted. The style of boarding best suited to withstand soft leaky soils was grooved and feathered, and all possible leaking points caulked with lead. Under the second heading, blasting was described at some length, as were also the types of centreing suitable for tunnelling. Under the third method, the system of air pressure was fully described, this being resorted to generally in muddy or dangerous grounds. The lecture was illustrated with numerous plates and blackboard sketches. A discussion followed, which was taken part in by several members.

Leeds and Yorkshire Architectural Society.

The great Church of Santa Sophia at Constantinople formed the subject of a paper read by Mr. J. B. Fulton, A.R.I.B.A., before the Society at a meeting held on Thursday evening, February 24th. Mr. Fulton, who has made an extensive study of this building, dealt in detail with the historical circumstances surrounding its erection. Built in the 6th century A.D., by order of Justinian to replace the old church which had been destroyed by fire—the cause of which may have been a suggestion from the Emperor himself—it occupied 5 years 10 months from commencement to dedication. The work of Anthemius of Tralles, the greatest architect the world has ever known, Santa Sophia ranked with the temples of Karnak and the Athenian Parthenon as one of the great pinnacles of architecture.

Spanned by a great dome, Anthemius' masterpiece surpassed all previous works, and stands to-day—to quote Mr. James Fergusson—"the most perfect and the most beautiful Church which has been erected by any Christian people." It was the culminating point of ancient art, at which for once in the history of art East and West joined hands, a lasting monument to the genius of Anthemius.

Structurally, Santa Sophia, on the authority of M. Auguste Choisy, astonished its contemporaries by its wonderful lightness; to them it appeared—to use their thoroughly Oriental form of admiration—that its dome was suspended in space by an invisible power, so slender were the supports that up-

MEMORIAL TO THE LATE H. A. PROTHERO, F.R.I.B.A., AT CHELTENHAM COLLEGE CHAPEL. L. W. BARNARD, ARCHITECT

The Memorial takes the form of a vaulted narthex or porch with elaborately carved oak doorway and mosaic tympanum.

held it. Yet, so sound and logical was the construction that with the exception of the four corners which were evidently the weakest points of the building and had been thrust about 18ins. back from their original positions, the vast system of arches stand today apparently sound. Everywhere—both within and without—great piers had been built, and after the Turkish occupation, the four minarets were built in the 16th century.

Internally, the acoustics were perfect, and the original arrangements were such as to give appropriate emphasis to the altar. In the words of Professor Aitchison, "As the interior of the Pantheon strikes one as the most sublime building, the exterior of the Parthenon as the most perfect, the exteriors of some of the French Cathedrals the most wonderful, the interior of St. Mark's as the most gorgeous, so the interior of S. Sophia strikes ones as the vastest building one has seen."

The great beauty and charm of the interior lay, not only in the constructive features, but also in the power and beauty of great horizontal cornices, placed at the correct relation to heights and broken only on plan. Mr. Fulton thought this was the secret of Byzantine design, and nowhere had it been used to greater advantage than in this vast pendentived hall.

CENTRE BOSS OF VAULT, PROTHERO MEMORIAL PORCH, CHELTENHAM COLLEGE CHAPEL. L. W. BARNARD, ARCHITECT

Standing at any point in the nave, the eye moved from one vista to another in endless variety. The golden vaulting of the aisles and galleries gave colour and distance, while all the nearer features carried the eye to the great dome crowning all. The views of the nave from the aisles and galleries were unsurpassed, the columned low-vaulted richness of the aisles contracting with the seemingly infinite height of the nave.

Analysing the details of the plan, Mr. Fulton explained that the four great stone piers or buttresses measured 67ft. 6ins. by 25ft. 2ins. by 101ft. 8ins. apart from North to South, and not only did they carry the weight of the cross arches but were also designed to take the thrust of pendentives supporting dome and cross connecting arches supporting dome.

The necessary depth of the buttresses allowed for openings to be left forming the north and south aisles; while the thrust of the dome necessitated the buttresses being carried to the height of the base of the dome far above the roofs of aisles, forming features in the elevation which are so charming and logical.

The dome supported upon 40 piers rose 46ft. 9ins. above the cornice and internally ribbed ascended to a great circle 37½ft. in diameter. The length of the Church exclusive of apse, was 244ft. 6ins., while its breadth including aisles was 228ft. 10½ins.

A vote of thanks was accorded Mr. Fulton for his lecture, and a discussion led by the president, Mr. Percy Robinson, F.R.I.B.A., followed.

THE NEW HERON MILL OLDHAM NEAR THE OLDHAM ARDEN SUBURB.

OLDHAM'S GARDEN SUBURB.

By J. H. Crabtree.

Oldham has long had a reputation for progress in the building-world, and its present activity affords a striking illustration of what can be accomplished in a manufacturing town.

In all directions new buildings of a superior order are rising, so that the house-famine with which the town was threatened during the recent cotton-boom, is likely to be warded off for many years to come. Scores of cottages, unfit for habitation, have been closed or completely demolished to make way for houses suitable for occupation by Oldham's workers. Several parts of the town are assuming a pleasing aspect at the builder's hands. The schemes of improvement which are well afoot are finding ample occupation for hundreds of bricklayers, joiners, plumbers and general labourers whose employment was so seriously depleted when the construction of new factories was sealed by adverse trade in cotton-spinning. Contractors, too, welcome an impetus in business. At a period when mill dividends are few and sparing, there is some incentive to launch forth in house-building and many persons with savings prefer to invest in property when mill-shares are so fluctuating. The recess in the staple trade, therefore, is giving a favourable opportunity for activity in general building-work other than the erection of mills.

Just now, in addition to all its other enterprises, Oldham is turning serious attention to the erection of a new suburb on the South side of the town. This movement emanated from "The Beautiful Oldham Society" which has for its object the betterment of Spindledon from centre to circumference. The society means to cleanse the slums, to close houses unfit for habitation, and promote horticultural pursuits among the juvenile population. Then there arose a desire for superior dwellings, an improvement in town-planning, with an equitable return for a generous outlay.

A new company was formed—the Oldham Suburb Tenants, Limited—and a plot of 50 acres was surveyed near Hollins Road, the main thoroughfare leading from Manchester City to Hollins and Ashton-under-Lyne. The

OLDHAM GARDEN SUBURB A CORNER VILLA.

D

HOUSES, OLDHAM GARDEN SUBURB.

site and outlook were auspicious. The land presents a gentle slope to the south, and is open to the green fields for miles ahead; while townwards it is amply protected from the evolutions of Oldham's chimney-stacks by intervening space and buildings.

The purchase price, £150 per acre, was distinctly encouraging. For estates similarly situated, the usual price is from £200 to £350 per acre.

Since the cutting of the first sod in March, 1908, the development of the estate has proceeded with commendable swiftness. Already over sixty houses are either completed or are in course of erection; these let at rentals varying from 5s. 6d. to 7s. 6d. in addition to local rates. All buildings are subject to plans drawn by the architects of the estate, and to the approval of the town authorities. The scheme contemplates the erection of about 600 dwellings forming a model colony for some 3,000 people.

The bulk of the houses have five or six rooms, and do not exceed in rental that of ordinary middle-class cottages in the town. Further, these rents being fixed by the owners of the estate, there can be no interference from external agencies. On the north side the suburb is banked by a continuous line of cottages with gardens and lawns in front. In other portions of the estate the houses are semi-detached with ground on three sides available for gardening. These semi-detached cottages have a living-room 14ft. 6in. by 14ft. 3ins; a sitting-room, 10ft. 2ins. by 10ft. 9ins.; a scullery, 7ft. by 10ft. 9ins; two bedrooms measuring 14ft. 6ins. by 14ft. 3ins., and 14ft. 6ins. by 10ft. 9ins. respectively. The sitting-room may, if desired, be easily converted into a bedroom. The height of the ground-floor rooms is 9ft. The bedrooms are 9ft. 9ins. at the highest point, sloping down to the roof-edge. Other houses are in contemplation with larger rooms, to be completed at rentals of about 6s. weekly. It is thus clear that all the best types of middle-class dwellings will be in vogue, and being in close touch with the local tramway, Oldham business men may pass from town to garden-suburb in twenty minutes.

There is to be no over-crowding at Hollins Green. Not more than fourteen houses are allotted to the acre. The whole plot is now full of human energy; labourers are cutting new roads, contractors are fixing new erections, and the suburb is breezy with bricks, mortar and floor-boards. The present main thoroughfare, aptly termed "Green Lane" is 12 yards wide from curb to curb; this is flanked on either side with 4 yards of space, allowing for the cultivation of garden-lawns, flower-beds, and small shrubberies. A green band of grass lines the roadway, with sprouting trees planted at convenient intervals.

The estate includes facilities for recreation for the young and middle-aged. A plot of 1½ acres has been reserved for the children's recreation ground; while another similar area is planned for allotment-gardens and nurseries. The main streets are gracefully arranged in sweeping curves; there is a studied avoidance of straight lines, squares and oblongs; and yet all parts of the estate are utilised with economy. There is no wastage of land in any quarter.

The town itself has signally approved the new undertaking, its principal business-men holding shares and promoting tenancies. The suburb is another venture in a town full of business tact and energy. The architects to the estate are Messrs. Heywood and Ogden, of Oldham.

Mr. Herbert Kendall, M.S.A., has commenced practice at Parkstone, Dorsetshire.

* * *

Messrs. Joseph Kaye and Sons, Ltd., Lock Works, Leeds, and 93, High Holborn, W.C., have just received further orders from the British Navy, 3,918 Kaye's patent seamless serrated oil cans, and 6,963 Kaye's patent seamless spouts, for H.M. Dreadnoughts.

Proposed New Works.

ABERDEEN.—The Harbour Commissioners of Aberdeen yesterday discussed a report by the engineer, Mr. R. Gordon Nicol, on the method of carrying out the construction of the new dock scheme in the river Dee and new wharves in Albert Basin. The estimated cost is £85,000, and the work will occupy about three years.

ABERDEEN.—The Town Council have approved the scheme for the provision of a dust destructor for the town.

ABERDEEN.—The directors of the Music Hall intend to make a structural addition to the building in the near future.

ABOYNE.—It was unanimously decided at a public meeting to purchase the existing Aboyne Public Hall, and to prepare plans for its extension. The present accommodation is entirely inadequate.

ALDERSHOT.—The plans for the enlargement of Aldershot parish church have been formally approved.

AMERSHAM.—The Buildings Committee of the Rural Council have approved the following plans:—Additions to Little Afric, Little Kingshill, submitted by F. D. Whitwell; additions to house, Packhorse Road, Chalfont St. Peter, Messrs. Johnson and Boddy; house, Bois Farm Estate, Chesham Bois, E. J. Gee; two cottages, Chalfont Common, R. Ramm; motor garage and stables, North Park Road, Gerrards Cross; two houses, Horn Hill Road, Chalfont St. Peter; five cottages, Moor Road, Chesham Bois; additions to house, Ley Hill; and three cottages, Prestwood, Hemp and How.

BANGOR.—Mr. Brook Kitchin, Local Government Board architect, has condemned as unsuitable and inadequate the present Bangor workhouse infirmary, and has recommended its destruction and also its erection on another site.

BIRMINGHAM.—The Local Government Board held an enquiry into the application of the Corporation for sanction to borrow £1,600 for the extension of the Woodside recreation ground and £867 for work of sewage.

BIRMINGHAM.—Mr. M. K. North, M.Inst.C.E., one of the inspectors of the Local Government Board, held an enquiry into the application of the Birmingham City Council to borrow £1,050 for the purchase of Nos. 14, 16, 18, and 20, Aston Church Road, for purposes of public baths, £750 for purposes of street improvement, and sums

HOUSES IN THE GREEN LANE, OLDHAM GARDEN SUBURB.

amounting to £8,945 for works of sewerage and surface water drainage.

BLACKPOOL.—The borough surveyor, Mr. J. S. Brodie, has submitted a scheme for the linking up of Blackpool's two promenades between the North Pier and the three Claremont Marine Parades, which has been approved by the Highways Committee. The approved scheme is a modification of one formerly presented, so much improved as to be practically a new plan.

BOSTON.—The plans of Messrs. Gordon and Gunton, architects, London, have been accepted by the trustees for the new Wesleyan chapel to replace the building in Red Lion Street, destroyed by fire some months ago.

BRIDGEND.—The Local Government Board have approved the plans of the proposed new offices, and the committee now recommend that the architect should be authorised to prepare specifications, for the purpose of obtaining tenders.

BUCKHAVEN.—Plans were submitted to the Town Council, for a proposed new slaughter-house at Toll Park, which were approved. The building is to be extensively lined with tiles, and is expected to cost about £4,000.

CAMBUSLANG.—The building will shortly be commenced of a new police station here.

CHESTER.—A Local Government Board inspector held an inquiry yesterday into the application of the Chester Town Council for sanction to borrow the sum of £3,000 for the provision of a new fire engine station in Northgate Street.

COVENTRY.—The General Works Committee of Coventry City Council has decided to invite architects to send in alternative plans showing how the vacant land in Earl Street can be best utilised for the erection of municipal buildings, and for a scheme for such buildings and Town Hall, the latter absorbing adjoinlng property.

CRICKLEWOOD.—On a site given by the Ecclesiastical Commissioners, the erection of a church hall and institute at St. Peter's Church, Cricklewood, has been commenced.

CROYDON.—The Plans Sub-committee have approved the following plans:—Kirby and Jordan, workshop, The Causeway, Mitcham; A. E. E. Hill, two houses, Park Hill Road, Wallington; A. E. Brown, two houses, Higher Drive, Coulsdon; B. Bryant, room in roof to house, Woodcote Road, Wallington; H. L. Wettern, additions to "Waratah," Sanderstead; J. Ivall, alterations to "Lynwood," Foxley Lane, Beddington; E. and A. Wates, ten. houses, Purley Park Road, Coulsden; Corporation of Croydon, additional pavilions to the Borough Hospital, Waddon, Beddington; C. Farley, two houses, Longfield Avenue, Wallington; C. G. Reed, house, corner of Julien Road and Bramley Avenue, Beddington; T. J. Edwards, four villas, Longfield Avenue, Wallington; C. Thomas, two houses, Edgar Road, Sanderstead; H. Nicholls, additions to "The Copse," Welcomes Road, Coulsdon; Miss E. F. Copley, house, Monahan Avenue, Beddington; A. A. Secrett, house, Osmond Gardens, Beddington; Mrs. Turner, house, Commonside West, Mitcham; A. E. Bates, three pair houses, Windermere Road, Coulsdon; W. Webb, new street, "Silver Lane," from Furze Hill to the Model Village, Beddington; Webster and Hawkes, four houses, Heathhurst Road, Sanderstead; A. Boulter, five houses, London Road, Hackbridge, Wallington; T. J. Edwards, mission room, London Road, Hackbridge, Wallington; G. Ive, house, Julien Road, Beddington; Minty and Dollimore, offices, Lower Road, Coulsdon; Pascall, Ltd., addition to factory, Streatham Lane, Mitcham; E. J. Tinniswood, six houses, Senga Road, Wallington; F. Miller, four cottages, Cavendish Road, Mitcham; J. T. Deakins. amended block plan of houses, Furze Lane, Purley, Beddington; C. H. Cearn, eight detached houses, Red Down Road, Coulsdon; Mizen Bros., six cottages, Feltham Road, Mitcham; G. Hyde, addition to shop, Brighton Road, Beddington.

HOUSES IN THE GREEN LANE AT THE OLDHAM GARDEN SUBURB.

DALBEATTIE.—Extension of Dalbeattie school.—At a special meeting of Urr School Board—Mr. Maxwell of Munches presiding—plans of an addition to Dalbeattie school buildings were submitted. The Board decided to proceed with the work, subject to the approval of the department. The cost is estimated at between £1,300 and £1,500.

DOUGLAS.—A special meeting of the Douglas Town Council considered the recommendation of the Finance Committee to purchase the Villa Marina and its beautifully wooded grounds, in the centre of Douglas Marine Promenade, for £60,000, from the trustees of the will of Henry B. Noble, the trustees undertaking to return £20,000 for the erection of a hall and museum.

DROYLSDEN.—The cost of the proposed new church will be £4,000, and it is hoped to begin building at an early date.

DULWICH.—Subject to the sanction of the Local Government Board, the Camberwell Board of Guardians propose to erect further accommodation for nurses at Constance Road Workhouse, Dulwich, at a cost of £3,200.

DUNDEE.—It is proposed to build a new mechanical laboratory at University College, Dundee. The architects, Messrs. Rowand Anderson and Paul, of Edinburgh, have been authorised to obtain tenders for the carrying out of the work.

DUNDEE.—It is proposed to erect a new Music Hall in Dundee. An architect has, on behalf of the promoters of the scheme, inspected several sites, but so far nothing definite has been decided upon. A palatial music hall is likely to be the outcome of the scheme.

DUNDEE.—The proposed Observatory is coming nearer realization. The late Mr. John Mills bequeathed £6,000 to the city for this purpose. The idea is to spend £2,000 on a building, £2,000 on equipping it with the necessary astronomical instruments, and to reserve £2,000 for maintainance. As soon as the question of a site is settled there will be very little difficulty in the way of making a start with the construction of a suitable building. Places suggested are the Law, Balgay Hill, Baxter Park, and Reves Hill, Broughty Ferry.

EALING.—The Ealing Town Council have decided to petition the Privy Council for the establishment of a police court at Ealing. It is proposed to adapt the present vestry hall for that purpose, and to erect a new vestry hall on land adjoining at a cost of £1,000.

EALING.—A new hospital is about to be built at Ealing at a cost of over £20,000, of which all but £5,000 has already been raised.

EAST HAM.—On Wednesday morning Dr. R. Deane Sweeting held an inquiry at the Town Hall respecting the application of the Town Council to borrow a sum of money for the provision of a mortuary and post-mortem room at the rear of the Town Hall.

ELGIN.—Mr. John Wittet, architect, has prepared a scheme for the proposed improvements at the municipal buildings. The cost is likely to be about £125.

ENFIELD.—The District Council have approved plans of the following proposed works:—The erection of one house in Station Road, and five houses in Oakhurst Road, Freezywater; the making-up of Rotherfield and Suffolk Roads.

ETON.—The following plans of new buildings were approved by the Rural Council, some of them being subject to certain conditions:—New cottage, Potter's Cross Road, for Mr. Tonman Mosley; pair of semi-detached houses near Packhorse Road, Gerrards Cross, for Mr. J. R. Wignall; new house, St. Huberts, Fulmer Way, Gerrards Cross, for Messrs. Boddy and Johnson; new washhouse at the "Chequers" Inn, Iver, for Messrs. Nevile Reid and Co.; alterations to gardener's cottage, new coach-house and stable for Mr. E. Clifton Brown, Burnham; new piggeries at Jersey Farm, Eton Wick, for Mr. M. D. Hill; two cottages at Beaconsfield Road, Farnham Royal, for Mr. Charles Luker; two houses, Gray's Park Estate, Stoke Poges, for Messrs. R. Jewell and Sons; New house, South Park, Gerrards Cross, for Mr. Malcolm Sparkes; pair of cottages, Bath Road, Langley Marish, for Mr. W. A. Owston; new house, Hillbrook Place, Iver, for Sir Henry Yorke, K.C.B.; new house, Layer's Way, Gerrard's Cross, for Messrs. Green and Co.; alterations and additions to Delaford Manor House, Iver, for Mr. Tonman Mosley.

ERDINGTON.—Mr. F. H. Tulloch, the Local Government Board inspector appointed for the purpose, held an enquiry at the Council Offices, Erdington, into the application of the Urban District Council of that place for sanction to borrow sums of £3,000 and £540 for works of sewerage and street improvement respectively, in Slade Road, Erdington.

FORFAR.—It is proposed to provide retiring rooms at the Town Hall, and also to improve the present lavatory accommodation.

FOUNTAINBRIDGE.—The plans and works committee of Edinburgh Town Council considered a motion as to providing washhouses in the Fountainbridge district. The matter was remitted to a sub-committee.

GLASGOW.—Arrangements have been made for the erection of a skating rink in Dunoon Castle Gardens.

GREAT HANWOOD.—The Council have decided to build public baths in the town.

HALTWHISTLE.—Plans were submitted to the Parish Council for the following proposed new works:—Mineral water works, at Eden's Lawn, for Messrs. Saint and Murray; two cottages at Wydon Terrace, for Jos. Hunter.

HAMILTON.—The Burgh School Board have decided to proceed with the excavation of the site and the erection of the necessary fences for the proposed new Academy for Hamilton, and instructions were given for the issuing of specifications to contractors. The plans have been approved, and the estimated cost of the building and site is £45,000.

HARROGATE.—The Local Government Board held an inquiry at the Harrogate Municipal Offices into an application by the Town Council for permission to borrow £950 for the erection of a shelter and the provision of lavatory accommodation in the Crescent Gardens.

HATFIELD.—Between Hatfield and St. Albans a fine estate is to be developed, known as Nast Hyde. No speculative building will be permitted.

HESTON.—The Works Committee of the District Council reported that the following plans had been approved:—From Mr. F. R. Wood, for six semi-detached villas at Haward Road, Isleworth; Mr. E. A. King, for eight terrace houses, at Kilmorey Road, St. Margaret's; Messrs. H. Tinckler and Son, for addition and alterations at No. 135, Haliburton Road, Isleworth. New houses approved:—Heston 6, Isleworth 8.

INVERURIE.—Messrs. Jenkins and Marr, architects, Aberdeen, submitted a report on the town house buildings. The report stated that the fabric of the clock tower was in good condition, but was in want of a thorough pointing. They recommended that the tower be pointed every three years, which would cost about £10. Some minor repairs to the roof were also suggested at a probable cost of about £12. The ventilation of the Town Hall was very defective, and the cost of a scheme for its improvement would be about £35. The heating of the Town Hall by means of hot-water radiators was suggested. This method would probably cost about £85. An alternative method of heating would be to use gas-steam radiators, costing probably about £56.

JOHNSTONE.—The Postmaster-General has purchased the post office buildings, along with the adjoining tenement and ground attached. Plans have been prepared for the remodelling and enlarging of the office, and operations are to be started immediately.

KEADY.—The Urban Council propose to erect new gas-works and plant.

KIRKWALL.—Mr. George Mackie Watson, Edinburgh, has prepared a plan for the proposed restoration of Kirkwall Cathedral, which has been approved of. The Town Council are the proprietors of the fabric.

KYLES OF BUTE.—It has been decided by the Kyles of Bute Hydropathic Company to proceed shortly with the rebuilding of their establishment at Port Bannatyne, which was recently destroyed by fire. Three Glasgow architects have been invited to send in competitive plans, and one condition is that the cost is to be about £15,000. The main outline of the old building is to be adhered to, and the existing walls and foundations utilized as much as possible. The architects invited are Messrs. George Bell, A. Balfour, and Thomson and Sandilands.

LEEDS.—An effort is being made to beautify the surroundings of the Leeds Town Hall. The process of improvement has commenced with the demolition of a block of shops and offices, half brick and half stone, with a frontage to East Parade, to Park Lane, and to South Parade. Some forty places of business are doomed. On this important site a handsome structure is to be built of white Portland stone for the Pearl Assurance Company.

Photo: C. H. James.

CENTRE DETAIL, NEW UNIVERSITY COLLEGE, CARDIFF. W. D. CARÖE, M.A., F.R.I.B.A., F.S.A., ARCHITECT.

LEWISHAM.—Lewisham is to have a large theatre of varieties at the corner of Rushey Green and Brownhill Road. The designs are by Messrs. F. Matcham and Co., and the building will be completed by the end of the year.

LIVERPOOL.—The Midland Railway Company has purchased, for £55,000, the land lying between the Adelphi Hotel and Hawke Street, and it is proposed to cover the whole of the site with an extension of the hotel, afterwards rebuilding the Lime Street frontage. The present hotel will probably remain unaltered for about three years, pending the completion of the block extending from Talim Street to Hawke Street. The existing block will then be taken in hand for remodelling, which may involve rebuilding.

LIVERPOOL. — Liverpool Municipal Offices.—The Local Government Board held an inquiry relative to the application of the Corporation for permission to borrow £225,000 for the purposes of schemes under Part 1 of the Housing of the Working Classes Act, 1890, for the improvement of Beau Street, Bevington, Holly Street, Frank Street, Grafton Street, and Saltney Street, including the erection of new dwellings for persons of the working class on lands within those areas.

LLANDUDNO.—Plans for the erection of the following buildings have been approved of by the Llandudno Council, viz.: Two houses in Mostyn Avenue, for Mr. H. F. Hall; house in Vicarage Road, for Mr. W. Broomfield; additions to the Empire Hotel, for Mrs. Hall; temporary shelters on the West Shore, for the Light Railway Company; stable, rear of St. David's Road, for Mr. T. Edwards; dormer, Spring Grove, Clifton Road, for Mr. J. Gatley; attics, Engadine, Roumania Drive, for Mr. A. Wilkes Green; residence, Fferm Bach Road, for Mr. Rawstron; alterations, Market Hall, for Llandudno Market Company; and alterations, Dorothy Café, Mostyn Street, for Mrs. Payne.

LONDON.—London Docks Improvements.—Mr. Harry Gosling, a member of the Port of London Authority, speaking at St. George's-in-the-East, said that at a meeting of the Authority it was decided to spend £52,000 on the erection of new sheds and other improvements at the London Docks.

LONDON.—It is expected that the work of painting the exterior of Buckingham Palace will be proceeded with in the spring. The roof of the building requires attention, and this will also be undertaken during the next few weeks.

LONDON.—It is proposed to construct a handsome approach to Southwark Cathedral.

LONDON.—Negotiations are in progress for the erection of a new concert hall near Regent's Park, not far from Queen's Hall and the new St. James's Hall. It will have a seating capacity of 3,000. The shape and general plan of the building will be after the style of the old St. James's Hall.

LONDON.—At a recent meeting of the Metropolitan Water Board, the Finance Committee was authorised to invite and accept tenders for Metropolitan Water Board bills to an amount not exceeding in the aggregate £750,000, in respect of authorised capital expenditure.

LONDON.—The Highways Committee recently decided, at a cost of about £1,200, to erect a tramway shelter on the Victoria embankment near Blackfriars Bridge alongside the northern tramway track.

LUTON.—At a meeting of the Town Council, the General Purposes and Fire Brigade Committee reported that the following plans had been approved:—W. H. Wren, alterations, Guildford Street; Hill Bros. and E. Hill, twelve cottages, Harcourt Street; Hill Bros. and E. Hill, house, Harcourt Street; D. Stonnell, eight houses, Warwick Road; A. Carter, four houses, Reginald Street; T. and E. Neville, workrooms, Hastings Street;

Photo: C. H. James.

FRONT ELEVATION OF THE NEW UNIVERSITY COLLEGE, CARDIFF. W. D. CARÖE, M.A., F.R.I.B.A., F.S.A., ARCHITECT.

J. R. Brown, open shed, Cheapside; S. Hubbard, stable and dye-yard, Regent Street; Luton Miniature Rifle Club, new shed, off Dallow Road; W. Mardle, four cottages, Clifton Road; J. Saunders and Son, two cottages, Shirley Road; J. C. Kershaw, w.c.'s, and lavatories, George Street; H. I. Sell, w.c.'s, etc., Langley Place; F. Chandler, two houses, Reginald Street; H. Cook, four houses, Leagrave Road; Vauxhall Motors, test room, off Kimpton Road; P. Allen, motor garage and store, Downs Road; S. W. Johnson, two houses, Conway Road; H. W. Cowell, two houses, Talbot Road; F. Merchant and Sons, alterations to shop, Manchester Street; Mardle Brothers, two houses, Round Green.

MERTHYR.—Mr. M. K. North, M.I.C.E., one of the inspectors of the Local Government Board, has held an inquiry at the Town Hall, Merthyr, into an application by the corporation for sanction to a loan of £2,000 to cover the cost of the purchase of seventeen acres of land at Gellifaelog for the erection of a new council school and working-class dwellings, and for the making of a recreation ground and other purposes.

NOTTS.—The directors of the Notts County Football Club have accepted plans, prepared by Messrs. W. and R. and F. Booker, for their new ground at Meadow Lane, and operations will very shortly commence. There will be accommodation for a crowd of 35,000 persons.

OMOA.—At a meeting of the Omoa Combination Poorhouse Committee a discussion took place regarding the damage caused to the Poorhouse buildings by underground workings. The committee were instructed to convene a meeting with the architect, so that an early inspection of the buildings may be made. The Poorhouse at Omoa was erected only five years ago at a cost of upwards of £40,000.

OSBORNE.—The authorities have definitely decided that the Royal Naval College at Osborne shall be entirely rebuilt.

OXFORD.—The plans of the proposed additions to the County Buildings, prepared by the County Surveyor, Mr. S. Stalland, have been adopted by the City Council. The estimated cost of this scheme will be £7,750.

PERTH.—The plans prepared by Mr. James Miller, A.R.S.A., Glasgow, of the proposed new infirmary for Perth, have been generally approved, and the directors of the Institution have been authorised to proceed with the erection of the buildings in conformity with them. The directors have also been authorised to dispose of the existing infirmary buildings. The estimated cost of carrying out the original plans is £36,190. Over £4,000 is required to complete the necessary sum.

RASTRICK.—It is proposed to build a new school to take the place of Rastrick Church and New Road Schools.

RENFREWSHIRE.—The following plans have been submitted to the building committee:—Double cottage at Carnwadric, Thornliebank, for Sir John Stirling-Maxwell, Bart.; double cottage in Florence Drive, Giffnock, for Messrs. James Dunbar and Co., Well Lane, Partick; and villa at corner of Auchenlodment and Craigenfeoch Roads, Johnstone, for Peter Jaffrey, Grahame Street, Johnstone.

RICHMOND.—The following plans have been approved by the Town Council. Mr. E. J. Partridge, additions to Elm Lodge, Petersham; Messrs. Brewer, Smith, and Brewer, new house, Mount Ararat Road; Messrs. Brewer, Smith, and Brewer, six new houses, Grosvenor Road; Mr. T. J. Davies, additions to No. 4, West Park Exchange; Messrs. Boore and Parker, two new houses, Mortlake Road; Mr. E. Taylor, new house, Leybourne Park; Messrs. Boroughs and Dixon, additions to No. 46, Church Road; and Messrs. Soole and Son, additions to Holy Trinity Parish Hall, Lower Mortlake Road.

ROMFORD.—The Urban Council have approved the following plans:—Two houses in Pretoria Road, for Mr. J. Butterfield; alterations and additions to "Priests," Havering Road, for Mr. P. C. Haydon-Bacon; and four houses in Carlisle Road for Mr. G. J. Harvey.

ROSYTH.—The proposed laying out of the ground at Rosyth town in conformity with a town-planning scheme on garden city lines is under the consideration of several Local Government Board authorities who visited Rosyth recently. The planning applies to the land south of the new road at Rosyth.

SOUTH AFRICA.—A scheme has been prepared for the proposed new Government buildings at Pretoria. Mr. Herbert Baker, architect, is the author of the scheme.

SOUTHEND.—The Southend Town Council have resolved that the following plans be approved:—Alterations, 8, Victoria Road, G. Clarke; tool shed, 4, Leighcliff Road, F. S. Oram; wash-house, Cardigan Avenue, H. M. Tickell; ten houses, Silversea Drive, A. F. Kerridge; alterations and shop front, 110, Broadway, High Street, Maypole Dairy Company; three houses, Ailsa Road, J. Poulton; warehouse, Park Road, J. T. Payne; stable, rear 90, Leigh Road West, H. Trist; new w.c., Theatre De Luxe, London Road, B. Tolhurst; one house, Old Leigh Road, E. H. Budd; one house, Old Leigh Road, G. G. Tarrap; new sewer, Rockleigh Avenue, The Land Company; twelve houses, Wenham Drive, G. A. Rogers; new vestry and porch, Trinity Church, Southchurch Road, rector and churchwardens, Trinity Church; one house, Lancaster Gardens, B. Jones; additions, St. Erkenwald's Church, York Road, Rev. Dormer Pierce; six houses, Beach Road and Uplands Road, J. Blanch; four houses, Glen Road, J. Blanch; one house, San Remo Parade, Miss Hall; four houses, Beach Road, W. Grey; stable, rear 117, Victoria Avenue, J. Bentall; and four houses, Southview Drive,, C. Denny.

STANLEY.—Mr. John W. Wilson, Sutton Coldfield, Warwick, has prepared designs for a proposed new Council House at Stanley.

STOURPORT.—It is proposed to erect a new drill hall, a scheme which has been approved by the Urban Council General Purposes Committee.

TORQUAY.—An inquiry has been held at Torquay by Mr. H. S. Bidwell, Local Government Board inspector, into the application of the Town Council to extend the borrowing powers of the Corporation for the provision of a new town hall and municipal offices.

WALLASEY.—It is proposed to erect a new church and parsonage house in this village.

WATERLOO.—At Waterloo Town Hall, Mr. E. Dudley, F.S.I., has held an inquiry into the Waterloo-with-Seaforth Urban District Council's application to the Local Government Board for sanction to borrow the sum of £1,020 for the purchase of property for the purpose of widening Mount Pleasant and Mersey View, Waterloo.

WHITLEY.—The Whitley and Monkseaton Urban District Council have applied to the Local Government Board for sanction to borrow £3,600 for the extension of the promenade from Eastcliffe to Promontory Terrace, and £800 for improvements to the sea banks adjoining such extension.

NEW ENTRANCE AND VESTIBULE, SILVERLANDS, CHERTSEY. RONALD P. JONES, M.A. ARCHITECT.

WILLINGTON.—The following plans have been presented to the Urban Council:—Proposed alterations to property in Chapel Street, Willington, by Messrs. Wetherall; and block plan for 30 houses in North Lane, Willington, by Mr. J. H. Armoury. The former was approved, but the latter was referred back for further consideration.

WIMBLEDON.—The question of erecting new municipal buildings for Wimbledon, with or without a town hall, has been revived through Moss Empires, Ltd., having offered to purchase for £8,000, the site on which the present municipal offices stand, for the purpose of erecting an entertainment hall upon it.

WITHINGTON.—The proposed new baths are to cost £15,000, in accordance with the proposals of the Local Government Board.

WORKSOP.—It has been decided to enlarge the Priory church by rebuilding the choir and restoring the ruined Lady Chapel. It is also proposed to restore the Priory gatehouse. The architect is Mr. Harold Brakspear, F.S.A.

WYKE.—At Bradford an inquiry was conducted on behalf of the Local Government Board with reference to the application of the City Council for sanction to borrow £359 for the purposes of laying out bowling greens at Horton and Wibsey Parks, and £2,900 for the purchase of the premises known as Victoria Hall, Wyke, and the adaptation of the same for the public baths and public library.

WYE.—It has been resolved by the Governors to extend considerably the present South-Eastern Agricultural College.

YARDLEY.—A Local Government Board inquiry was recently held at Sparkhill Council House by Mr. H. C. Monro in the application of the Yardley Rural District Council for sanction to borrow £820 for works of surface water drainage at Hay Mills, £6,150 for the construction of a bridge over the River Cole in Forman's-road, Sparkhill, and for the widening and improvement of the approaches thereto, and £1,250 for the purchase of the share of the Solihull Council in the Isolation Hospital at Lyndon End, Olton.

Notes and News.

With the assembling of Parliament the Rosyth Granite Controversy has again revived. Mr. McKenna, in answer to Mr. Goldman, M.P., for Penryn and Falmouth, stated that the granite for Rosyth had been submitted to physical, but not to chemical or microscopic tests. The result of the test was satisfactory, and showed Norwegian granite to be as suitable for the purpose for which it was required as British or Irish stone.

* * *

Mr. Frank H. Jones, A.R.I.B.A., of Buenos Aires, writes concerning a leader on buildings in that city, appearing under the title of "The Broader View," in our issue of January 12th. He states that the architect of the new Central Argentine Railway Station is Mr. E. L. Conder, F.R.I.B.A. Mr. Chambers, who in our remarks was associated with Mr. Conder, is a member of an entirely separate firm, Messrs. Chambers and Thomas, who had no connection with the building in question.

* * *

The text has been issued of the Bill to amend the Ancient Monuments Protection Acts, 1882 to 1900, with respect to the gift, devise, or bequest of monuments to the Commissioners of Works. The memorandum states that power is given under the earlier Act for any person to bequeath to the Commissioners of Works any ancient monument to which that Act applies, and to the Commissioners of Works to accept any such bequest, if they think it expedient to do so. The ancient monuments to which the Act of 1882 applies are the monuments described in the schedule to that Act and any other monuments of a like character indicated from time to time by Order in Council. The monuments described in the schedule to the Act are such that it is impossible to include as monuments to which the Act applies any ruined buildings of historic or architectural interest. Inconvenience has arisen in practice as a consequence of this limitation, and to remedy this, the Bill extends the provisions of section 4 of the Act of 1882 to all monuments within the meaning of the Ancient Monuments Protection Act, 1900—that is to say, to any structures, erections, or monuments of historic or architectural interest, or any remains thereof.

* * *

The projected enlargement of the chancel of Puddletown Church, Dorsetshire, is the subject of a protest to "The Times" by Mr. Thackeray Turner, of the Society for the Protection of Ancient Buildings, which protest is supported by Sir Frederick Treves and Lady Dorothy Nevill. The church has been untouched since the 17th century, and possesses the high-backed pews, pulpit and clerk's desk, etc. The Dorset Natural History and Antiquarian Field Club have also passed a resolution of protest.

* * *

Mr. Ronald P. Jones has advised us of a slight error which occurred in our issue of the 23rd ult., which stated that to the sum of £50 given to the Liverpool University by Mr. Jones, for the purpose of a travelling scholarship, a further £5 had been added by the British School at Rome. The amount which has actually been given is £25, thus making a sum total of £75.

The ancient castle at Richmond, Yorkshire, has by arrangement between the Duke of Richmond and Gordon and the Commissioners of Works and Public Buildings, passed into the hands of the latter body. The Commissioners, in undertaking the care of the ruins, are exercising their powers under the Ancient Monuments Protection Act, 1882, and the amending Act of 1900. When the Commissioners have been constituted guardians of a monument they do not acquire the freehold, which remains vested in the owner, but it is their business to maintain the structure and to do all that is necessary for the purpose of repairing it or protecting it from decay and injury.

LIVERPOOL DEPARTMENT OF CIVIC DESIGN: MUNIFICENT DONATION.

A donation of nearly £100,000 is being offered by Mr. W. H. Lever to Liverpool University. In making this announcement last Saturday Mr. Lever stated that the option of purchasing the Blue Coat School in Liverpool rests with the University, and he would either pay the purchase-money (£24,000) or provide a similar amount for the erection of buildings adjoining the University to accommodate a Department of Civic Design and School of Architecture. He also promised to endow with £800 a year for ten years the Civic Design Department, as well as endowing two other departments, one with £800 a year and another with £200 a year.

NEW LOGGIA, SILVERLANDS, CHERTSEY. RONALD P. JONES, M.A., ARCHITECT.

VESTIBULE, SILVERLANDS, CHERTSEY. RONALD P. JONES. M.A., ARCHITECT.

The woodwork is in oak, elaborately carved and enriched. The ceiling is decorated with modelled plaster work. The flooring is carried out in Cipollino and white marble.

R.I.B.A.

A special general meeting was held on Monday, February 28th, 1910, Mr. A. W. S. Cross, M.A., Oxon., vice-president, in the chair.

The Chairman announced that the meeting was convened, pursuant to by-law 64, to elect the Royal Gold Medallist for the current year, and having moved in accordance with notice that Mr. Thomas Graham Jackson, R.A., be elected for the honour, it was unanimously resolved that, subject to His Majesty's gracious sanction the Royal Gold Medal for the promotion of architecture be awarded this year to Mr. Thomas Graham Jackson, R.A., for his executed works as an architect.

The ninth general meeting (business) of the session 1909-10 was held at the conclusion of the special general meeting above referred to.

The Hon. Secretary announced the decease of Edward Shewbrooks, Fellow, Osman Hamdhi Bey, Hon. Corresponding Member, and Alfred Burnell Burnell, Fellow.

The following candidates were elected by show of hands under by-law 9:—

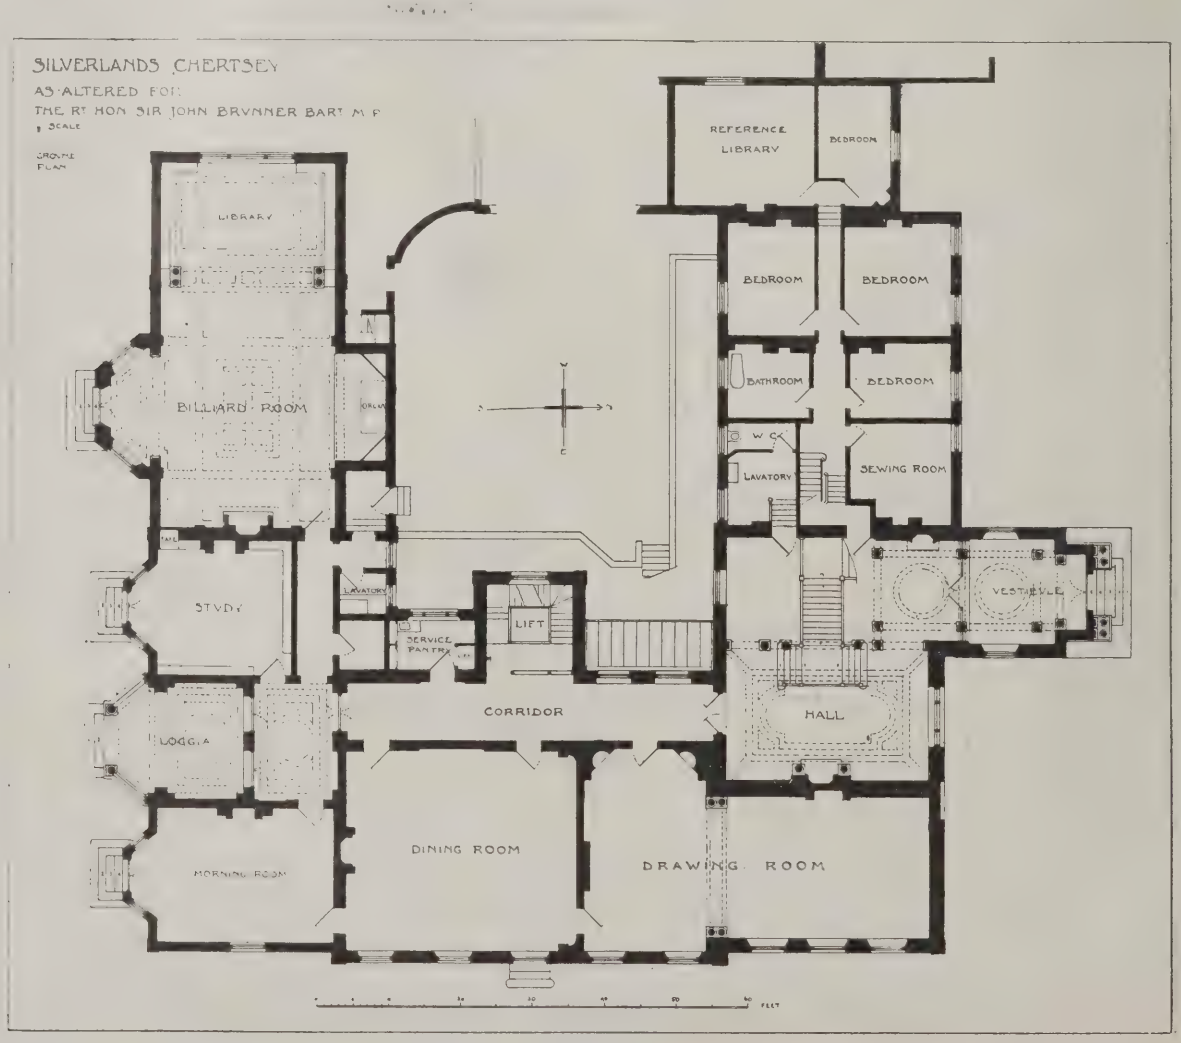
As Fellows: T. D. Atkinson (Cambridge); P. E. Nobbs, M.A. (Montreal); A. N. Paterson (Glasgow). As Associates: J. C. Ainsworth, M.A. (Manchester); J. G. Allen; R. Atkinson; J. Auty (Morley); Q. M. Bluhm (St. Anne's-on-the-Sea); C. G. Boutcher; A. F. Bryan; G. H. Burstow (Brighton); R. T. Chapman (Bolton); S. E. B. Claypole; J. A. Davidson (Londonderry); C. W. Davis (Birmingham); H. A. Dickman (Nottingham); A. H. Douglas; P. I. Elton; E. Finn (Canterbury); W. Goodchild (Ipswich); L. R. Guthrie; C. E. Hanscomb; R. E. Hastewell (Northumberland); F. G. B. B. Hawkins; F. H. Heppel (Worcester); H. C. Hollis: W. C. Maxwell (Belfast); W. Milburn, jun. (Sunderland); A. H. Moberly, B.A.; R. W. Orme (St. Annes's-on-the-Sea); R. Orr; F. Osler; J. Page; W. J. Roberts, M.A.; G. H. Rowledge (Manchester); W. H. Sagar; H. H. Scott-Willey; G. M. Stone; C. Stonehouse (Bolton); F. G. Troup; V. Ware (Bournemouth); J. Woollatt (Nottingham); C. L. Wright. As Hon. Associate: A. Dunn (Bournemouth).

Consideration of the Revised Regulations for the Conduct of Architectural Competitions adjourned from the meeting of the 7th February having been resumed, the document was discussed and various suggestions for amendment were offered. Whereupon, on the motion of the Chairman, seconded by Mr. Frank Lishman [*A.*], it was resolved, that the revised Regulations for the Conduct of Architectural Competitions be referred back to the Competitions Committee, with a recommendation that they co-opt on to the committee provincial members and others interested in the subject.

THE ARCHITECTURAL ASSOCIATION.

The following is the "House List" proposed for the session 1910-11. The list will be discussed and voted upon at the next meeting. President: *Arthur Keen. Vice-Presidents: *Sir A. Brumwell Thomas, *Gerald C. Horsley. Ordinary members: C. C. Brewer, W. D. Cathcart, *F. Dare Clapham, F. C. Eden, *Horace Field, W. Curtis Green, *Herbert A. Hall, P. W. Lovell, *Percy May, *F. Winton Newman, H. Passmore, *C. Wontner Smith, J. H. Squire, W. J. Tapper, S. J. Tatchell, Stanley Towse. Hon. treasurer: *Henry Tanner. Hon. secretaries: *Edwin Gunn, *G. Leonard Elkington. Hon. librarian: T. W. Watkins. Hon. Editor "A.A. Journal": Allen Foxley.

*Member of present Council.



Our Plate.

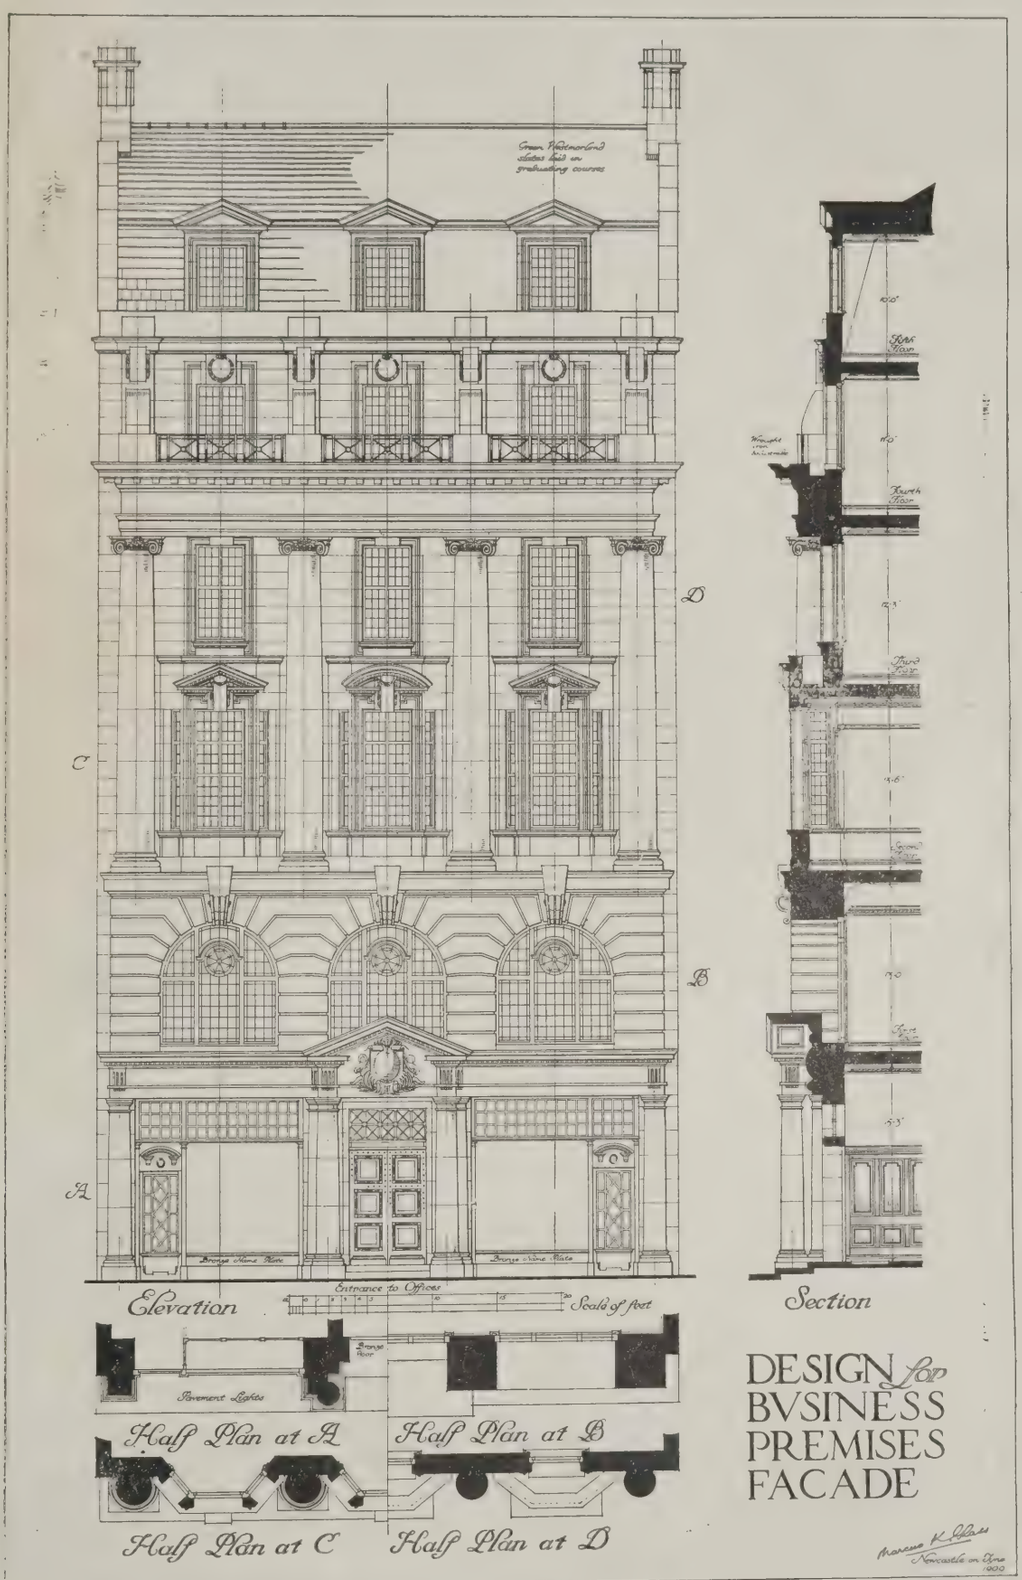
Additions, etc., to Silverlands, Chertsey.

The additions and alterations to Silverlands, Chertsey, for the Rt. Hon. Sir John Brunner, Bart., M.P., consist of a new entrance porch and vestibule on the north side, an extension of the garden loggia, and the rebuilding and enlargement of the billiard room. Several small rooms were demolished to form a large entrance hall, rising through two floors, with a broad central staircase. New doors were provided in the dining room and corridors, and the interior of the loggia was panelled. In the billiard-room some of the old panelling had to be reused; its extension westward was fitted up as a library, and a case was provided for an organ.

All the interior woodwork is in oak, elaborately carved and enriched. Cipollino and white marble floors are used in the vestibule and loggia. The whole house was renovated inside and out. A complete new system of electric wiring, sanitation, and heating was installed. Fixed lavatory basins and hot towel-rails were fitted in each bedroom and dressing-room. An electric lift was placed in the well of the back stairs.

The architect was Mr. Ronald P. Jones, M.A., of 7, Stone Buildings, Lincoln's Inn; and the general contractor, J. A. Hunt, Hodesdon, Herts. Woodwork-carving by J. Aumonier. Stone, Bath Stone Firms. Plumbing and sanitary work, heating and ventilating, Matthew Hall and Co., London. Mosaic, marble and stone, marble-work mantelpieces, Farmer and Brindle, London. Plasterwork, G. Jackson and Son, London. Art metal work and door furniture, Birmingham Guild of Handicraft. Electric light fixtures, Veritys. Electric lifts, Waygood and Co., London.

RONALD P. JONES, M.A., ARCHITECT.



The Hall.

The Organ in the Billiard Room.

ADDITIONS TO SILVERLANDS, CHERTSEY. RONALD P. JONES, M.A., ARCHITECT.

This is a design by Mr. Marcus K. Glass, of Newcastle-on-Tyne, for a business premises façade, with the main offices floors suitable for an insurance company's offices, in a main thoroughfare on a site 45 ft. wide. Portland stone would be used for facing, and the roof covered with green Westmorland slates laid in graduating courses. The woodwork to the shops and first floor windows would be of teak, and the windows generally would have steel casements and leaded lights. The entrance doors and fanlight would be sheathed with bronze.

THE LIFE AND WORK OF WILLIAM BUTTERFIELD,*

By E. Swinfen Harris, F.R.I.B.A.

William Butterfield, F.S.A. was born in Gordon Square, London, on the 7th of September, 1814; he departed this life on Friday, the 23rd of February, 1900, at his residence, 42, Bedford Square; he was buried on the Friday following, 2nd of March.

Some of his best architectural efforts have been already well described, illustrated, and criticised in an admirably written article which appeared in the "Architectural Review" for June and July, 1900; an excellent and life-like portrait is given with the letterpress of the memoir, over which Mr. Halsey Ricardo has, in his thoughtful critique, in no one particular spared himself.

It has been my great good fortune not only to see and handle very many of his carefully made drawings, so full of the results of deep thinking as they one and all are, but also to visit and carefully examine the following buildings of his.

All Saints' Church, Clergy House, Choir School, and the Parochial Schools in Margaret Street.—Mr. Ricardo has summed up the salient points, but it may be of some interest to you to know that his designs and drawings for this church were on view in the first Great Exhibition of 1851.

The School Chapel, School Buildings, Gymnasium, Racquet Court and Fives Courts—Rugby School.—The way in which the many difficulties as to the chapel in so limited an area were overcome is a great sign of his patience, which must have been tried by the insistence on the retention of many of the hallowed if incongruous features.

The rebuilding of Saint Andrew's Parish Church, Rugby.—Here, too, he was seriously hampered in having to incorporate an old tower with his new work. The retention, too, of the old nave as an aisle is a very clever piece of work; the two hagioscopes recall his earlier sympathy with old methods, specially when, as here, they could be made subservient to his needs.

The Church and Clergy House of St. Alban the Martyr, Brooke Street, Holborn, 1861-2.—A noble, dignified, and well-arranged church; its west end specially reveals the work of a master mind, embodying great height and scale.

Balliol Chapel, Oxford, is a fine piece of design.

Saint Matthias, Stoke Newington, 1851-3, an early work, full of quiet grace and dignity. The ritual arrangements here, as elsewhere, are admirable.

Keble College Chapel, Dining Hall, etc.—The chapel, containing among its treasures Holman Hunt's "Light of the World," besides its importance as a vaulted structure, has the congregation placed parochially; good proportion as here shown is as necessary to success as is that of mere loftiness.

St. Ninian's Cathedral, Perth, N.B., 1851 (since completed by the late J. L. Pearson, R.A.).

Fulham Palace Chapel (1860-67).

Works in the Church of Ottery St. Mary, Devon, and the new house of Lord Coleridge, "Heaths Court," hard by it.

A Parsonage House in Burleigh Street, Strand.—The plan, in a confined area, is very clever.

All Saints', Babbacombe.—A church glowing with the marbles of the beautiful county in which it is placed.

Buildings in Winchester and St. Cross.

A New Church at Newbury.—A thoughtful and interesting piece of work. Of some of the stained glass noticed when I visited it perhaps the less said the better.

Chapel for St. John's College, Battersea, and New Parochial Schools there.—These you probably know—so I leave them for others to criticise. The chapel has been recently dealt with by my old friend and pupil, Mr. A. H. Ryan Tenison.

St. Augustine's Church, Queen's Gate (1871). In this church as in that of St. Andrew's, Rugby (in the walls), both works of his later years, he evolved what, for want of a better term, may be called the open stone rood, by cutting off the apex above the chancel arch, and raising the rood on high over and upon its horizontal line. Whether it will have an abiding influence remains to be seen.

The old Home and Chapel of the S.P.G. (1871), since rebuilt on another site hard by from the designs of Sir William Emerson, showed some of his quaint and most original dealing with brick patterning.

Melbourne Cathedral (1884).

St. Augustine's College, Canterbury (for the late Mr. Beresford Hope).

Ascot Priory Church.—This was done about 1865.

Churches at Belfast, at Enfield, Studley (Oxon), Bexhill, Isle of Cumbrae, together with very many others, as well as houses and schools all over the country.

S. Clement's, City Road (1882).

His masterly care in the design and arrangement of tile pavements, and specially as to the right place for a peculiarly beautiful blue-grey tile of his, greatly exercised him; not content with this, his formulæ for their laying, and retention in a cleanly state when laid, appears in a somewhat lengthy document well worth perusing; it shows his great thoroughness.

His mouldings usually are simple in section but very telling in effect, and show his great gift of self-restraint and an entire freedom from fussiness; perhaps some of us might think the charm of a little more variety might have been better, but that was not his way.

His loyalty to, and love of, the English square end once led him, when at Norwich, playfully to describe the great apse of its cathedral as "a piece of Norman extravagance!" Rugby Chapel, a case of necessity, is the only apsidal end of his of which I am aware. His love of the blue known as "cerulean" was often gratified in the decoration of his woodwork. His beautiful ridge-crestings, after all that has recently been said in favour of the half-round ridge, were but a survival or revival of old methods. Possessed as he was of the "single eye," there was nothing trivial, flighty, evanescent, or fashionable about his work; his natural reverence of mind and high sense of responsibility and duty, as he understood it, prevented this.

He objected to the term "organ chamber," preferring "organ room," and he preferred "nimbuses" to the more usual "nimbi."

That there was a certain lack of repose in some of his later works many of his staunch admirers will be unable to deny; generosity in his patrons may have contributed to it, proving that "the lean hound hunts the best."

His many designs in "Instrumenta Ecclesiastica" show great refinement, restraint, and originality. His great love of constructional colour only wants "the kindly hand of Time" to sober it into perfect beauty; may at least some of his works be left intact to receive it!

The Man.

So little that is known of his character as a man as I have, after some effort, been able to get together, must be the sole apology I can offer for writing a comparatively brief paper when I had fully hoped to be able to prepare a much longer one with which to test your forbearance.

His familiar figure was fairly well known when walking out for a visit to his club, the "Athenæum," to get his "dish of tea," and perhaps to hold conversation with those persons there whose privilege it was to know him, or to write occasional letters on various church matters, in which his trenchant and caustic humour found a congenial outlet.

He not only wrote long and very scholarly letters, but every sentence and every word of them had its due place, weight, and measure most exactly proportioned. In courteous terms few could hit harder, or in more knightly fashion, those delinquents, be they who they might, whose faults and failings he deemed it to be his duty to hit. That word "duty" was to him in all ways and at all times a masterful monitor who would put up with no shuffling and tolerate no form of weakness that could be cured or averted.

Excellent letters of his on theological subjects have appeared from time to time in the Church papers signed "A Churchman."

It may, perhaps, seem somewhat out of place here to say much as to his deeply religious life, and yet how still more feeble than they are would be my remarks, or indeed those of anyone else, were all mention of it to be omitted.

That he came so little out of his shell was a distinct loss to his professional brethren, but he could not change his nature, and probably never attempted to do so. No better illustration of his hermit-like life and his retiring habits can perhaps be recalled than the fact of his non-appearance to receive in person the gold medal given by the late Queen Victoria to the nominee, as he was, of the Royal Institute of British Architects (for the reception of which many of us would cheerfully walk a long way barefoot), on the plea that it would be "contrary to the habit of his whole life.

Very few of the so-called practical men ever took more pains than did Mr. Butterfield to prevent chimneys from the chance of smoking.

His loyalty towards good builders, when found worthy after experience of them, showed his keen sense of justice; his firmness in rejecting bad material soon revealed him to the slippery ones who had made experiments with him, as a man who would in no way allow himself to be trifled with. One of the former kind who built a house for me was so loyal to all his ways and habits that, though I was delighted to find such a rare form of virtue, I confess it became at times somewhat of a trial of patience to myself.

A frequent remark of his was "Are you quite sure of your measurements?" And yet another: "People will abuse me because I will use brick!" This latter was certainly made by one who well knew how to use it; his strong sense of the value of "texture" was very real, years before it became a popular word with us of to-day. There was little sympathy shown by him in the use of any art-cant, his method being rather to be art, than to talk about it.

A frequent reply to questions in conversation was "with a view to what?" As was another, used during his works, towards adverse criticism, oftentimes as unreasonable as illogical: "Mr. ——, I have a conscience!"

His remarks on "Church seats and kneeling boards," excellent in many ways, are somewhat marred by a too dogmatic spirit, avoiding deliberately, as they do, all elasticity or compromise to suit them to the possibility of adaptation to varying positions or circumstances.

In his later years he drew but little with his own hand (though few of his brethren had probably drawn in their time more than he). He spent very much thought and care in criticising and amending the work of his staff, his then idea being that it was a "waste of effort" to do otherwise.

It is perhaps to be regretted greatly, even from an archæological point of view, that the countless measured drawings of old work made by him (very much of which it is to be feared is now no longer in existence), have not descended to us for careful preservation, or, better, for opportunities of study, and perhaps of fruitful inspiration.

The Friend.

Grave and unsympathetic as he was supposed to have been to and by many, he was by nature one of the kindliest and most hospitable of men to those few who had the good fortune to possess his friendship; such always prized it.

Among the architects of the Victorian age alone, what a wide field for study and observation might be evolved by any earnest young student among us as to their varied and various methods of producing their effective characteristics in their several works!

*Summary of a lecture delivered before the Architectural Association on Friday, February 18th.

For instance, if we compare those of William Butterfield and William Burges we shall find in those of the former a simple directness of aim produced by the use of ordinary materials trained and used for a definite effect, while the other puts up huge stones for the sculptor to do his bidding by liberating from them, as it were, the racy figures full of humour, of forms, both human and animal, sacred and profane, hidden within them, full as they are of exhaustive (and possibly exhausting) studies from Greek and mediæval lore. So varied are the motives at work in various brains! As restorers or preservers of old work we shall do well to act on the wording on the tomb of another great architect of the same era (J. L. Pearson) "Sustinuit et Abstinuit."

Let us (when we can do so with a clear conscience) try and speak kindly of one another's work.

It is a good and hopeful sign that we are now so keen in our wish to know more of the ways, characters, and personalities of the men themselves, as well as of their works, far more than has hitherto been cared about; like the pleasant re-unions of the R.I.B.A., unknown in old days, this cannot but be helpful to us. The more we know of each other the better for the progressive influence of our art; nor is it at all inimical to that friendly rivalry which should lead us on to greater excellence.

We architects are not a wealthy body, and the exception does but prove the rule; may be, our epitaphs will resemble the last words of a divine: "I die, as a Bishop should, without money"—may we also resemble that Bishop in the latter half of the sentence too —"and without debts!"

Discussion.

Mr. G. Fellowes Prynne, in proposing the vote of thanks, said that Mr. Harris, being a friend of long standing and an enthusiastic architect and art lover, it afforded him (Mr. Prynne) the greatest possible pleasure to perform that duty. These essays upon the past leaders of the profession were of enormous value to students; and this particular instance dealt with a man of strong feeling and definite originality. In admiring the work of these past masters, one was only too apt to become blind to its faults. He counselled kindly criticism of their professional brethren; for the disparaging remarks so very frequently heard were of doubtful value to the cause of architecture.

In many instances, work that had been severely criticised by contemporary judges had afterwards been greatly admired. The man who criticised with bitterness was not qualified to criticise. Nothing was better than fair criticism, which became of inestimable value in after life. He did protest, however, against the superficial trash called criticism. He remembered the Dean of —— (the name he was unable to recall) saying that Butterfield was the Fra Angelico of the age, thus putting him upon a pedestal so high as to threaten a fall. Butterfield had been regarded as a god in art, but many of his restorations failed to prove his right to such a position. He was, perhaps, not so much a restorer as an originator. His (Mr. Prynne's) first introduction to Butterfield took place while visiting at the house of a friend. An old gentleman who was lying on a sofa asked him how he liked a church that Butterfield had recently restored. He (Mr. Prynne) replied that it was not a restoration, but pure Butterfeld. The old gentleman was Butterfield; and it was perhaps not very remarkable that he afterwards became somewhat cold and off-handed. Mr. Prynne then commented upon the coincidence of the appearance in one week of two papers exactly alike in character. He then drew a comparison between Bodley and Butterfield, who, he said, in common with all old architects, had studied ancient work, but still retained a strong individuality of his own.

Mr. H. H. Statham, in seconding the vote of thanks, observed that the illustrations noticed on the wall, representing what might be called Butterfield's conservative attitude, were distinctly interesting to him as one who remembered the time of the Gothic revival. That passion for Gothic had now passed with himself, but the church of All Saints', Margaret Street, possessed an originality which kept it alive still. The treatment of the whole church, especially of the courtyard, was wonderfully enjoyable.

Butterfield was certainly a man influenced by the Gothic revival, but expressing it in his own style. The church of St. Cross, to which he (Butterfield) had added nothing but colour, he thought somewhat overdone.

Mr. F. R. Farrow supported, and remarked that, although Butterfield was a man naturally of a retiring disposition, he took a keen interest in the work of the Architectural Association. While he (the speaker) was delivering a series of class lectures there, he had received a letter from Butterfield pointing out very clearly the best method of laying tiles on roofs; and this, he thought, proved that Butterfield must have read the Brown Book, and must have taken unusual interest in the instruction given to students. As had been remarked, they had had two lectures on Victorian architects in one week Both had expressed their individualities in their work. The men of the nineteenth century were unquestionably ardent students of old work. Although Butterfield differed in many respects from Bodley or Street, his work was well worthy of study by present-day students.

Mr. Walter Millard said that he had never known Butterfield, and had only seen his work from the outside. He would like to know what right anyone had to judge buildings before they had been thoroughly and carefully examined, in both plan and section, and due regard had been paid to the conditions under which they had been built. Butterfield, it was certain, did master his problems. Buildings nowadays were invariably illustrated by photographs, which told the enquiring architect nothing that he wanted to know. The diaper brickwork to which Mr. Harris had referred was never in accord with the gable simply because Butterfield desired it so.

The bricklayer set the pitch to which the carpenters worked, and he had known instances of this in Mansard roofs, which the bricklayers set by means of "headers." He believed that Butterfield's work would live, because it represented the spirit of the time, and was no mere copyism.

Mr. Arthur Keen, who also supported the vote, reminded the gathering that this essay on Butterfield was the outcome of a suggestion he had made some time ago. He then read a letter from Mr. Halsey Ricardo, regretting his inability to attend the meeting. Butterfeld's buildings, he continued, were invari-

CHELTENHAM COLLEGE, NEW JUNIOR DEPARTMENT. WALLER AND SON, ARCHITECTS.

The new building is treated, externally, very simply, relying on the outline of the mass, rather than elaboration and detail of effect. The facings are of red brick, with quoins of a darker red, stone dressings sparingly introduced, and green Delabole slate roofs.

ably beautifully judged, well composed, and, for the time they had been in existence, had stood remarkably well. Mr. Theodore Fife made a few remarks, paying a eulogistic tribute to All Saints', Margaret Street.

Mr. Henry Tanner observed that it was not often they managed to get one of the older members to read a paper. However, when they did, it was heartily appreciated. Although not an admirer of the Gothic revival, he could not help thinking that much was in the "grand manner" (a phrase, he knew, usually associated with classic), of its type.

Mr. Harris then replied.

THE LONDON MASTER BUILDERS' ASSOCIATION.

A special general meeting of the London Master Builders' Association was held on Monday, February 28th last, when the proposed code of new rules was submitted, pursuant to the old Rule XXII., and the following resolution was adopted:—"That the existing rules be and the same are hereby rescinded, and that the rules set forth in the printed document submitted to the meeting, and, for the purpose of identification, subscribed by the chairman, be and are hereby adopted as the rules of the association from this, the 28th day of February, 1910."

The 38th annual general meeting was held on the same day as above, when the minutes of the last annual general meeting, the audited accounts, and the report of the Council for the year were adopted.

Officers Elected for the Current Year.

President: Mr. Leonard Horner (Messrs. Ashby and Horner).

Senior Vice-President: Mr. G. Bird Godson (Messrs. G. Godson and Sons).

Junior Vice-President: Mr. Jas. S. Holliday (Messrs. Holliday and Greenwood, Ltd.).

Treasurer: Mr. Walter Lawrence, jun. (Messrs. Walter Lawrence and Son).

New members were elected to fill vacancies on the Council, which now consists of:—

Past Presidents: Messrs. F. J. Dove, H. H. Bartlett, J. Howard Colls, T. F. Rider, Frank May, J.P., Joseph Randall, T. Gregory, J.P., Charles Wall, Wm. F. King, Ernest J. Brown, J. Carmichael, J.P., Fredk. Higgs, Col. G. Howard Trollope, V.D., Henry Holloway, J.P., Wm. Shepherd, B. I. Greenwood, J. W. Lorden, F. L. Dove, L.C.C., Wm. Lawrance, and F. G. Rice.

Elected Members: Messrs. G. Appleton, H. Arthur Bartlett, S. B. Depree, A. B. Falkner, J. Garrett, B. J. Grover, W. Hammond, H. W. Horner, E. J. Hill, A. C. W. Johnson, C. F. Kearley, H. A. Knight, J.P., F. Lown, F. M. May, F. G. Minter, G. Neal, G. H. Parker, Jas. F. Parker, F. P. Rider, C. C. Trollope, A. W. Turnbull, Henry Wall, W. F. Wallis, J.P., Howell J. Williams, J.P.

Hon. Auditor: Mr. A. Killby (Messrs. Killby and Gayford, Ltd.).

A very hearty vote of thanks was given to the retiring President (Mr. F. G. Rice) for the ability, tact, and energy he had displayed during the year of his presidency.

An interesting address was given by Mr. W. Cohen, Divisional Officer of the Labour Exchanges, upon the scheme and working of Labour Exchanges, and he attached much importance to the sympathy and co-operation of employers in furtherance of the movement.

A special Council meeting was held on March 3rd, when the new rules were ordered to be printed together with the pamphlet and circulated among the members.

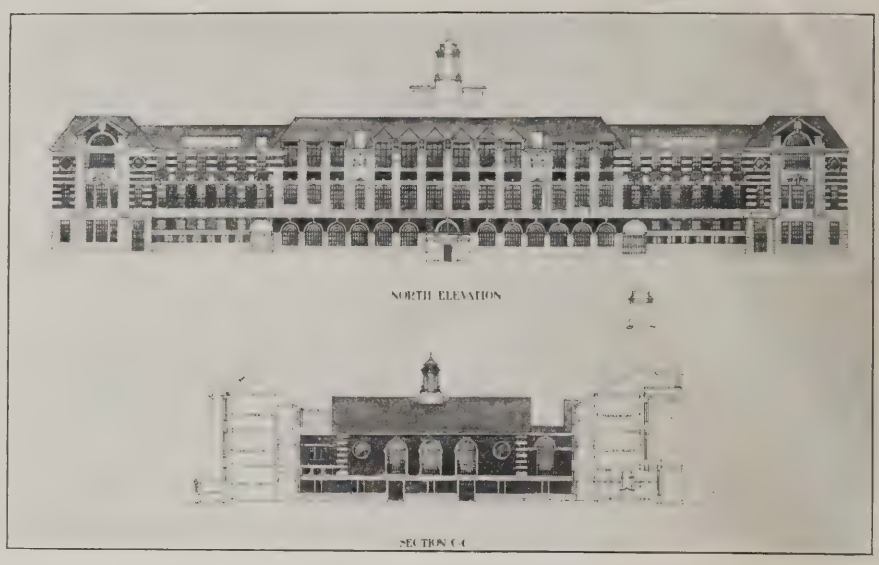
References to the proceedings of the annual general meetings were submitted.

A long discussion took place on the questions: (1) Tendering in competition where no quantities are supplied; (2) tendering where the conditions of contract imposed are of an unusual or extraordinary nature.

The Council then proceeded to make election of members on the various committees and Conciliation Boards, also representatives on the:

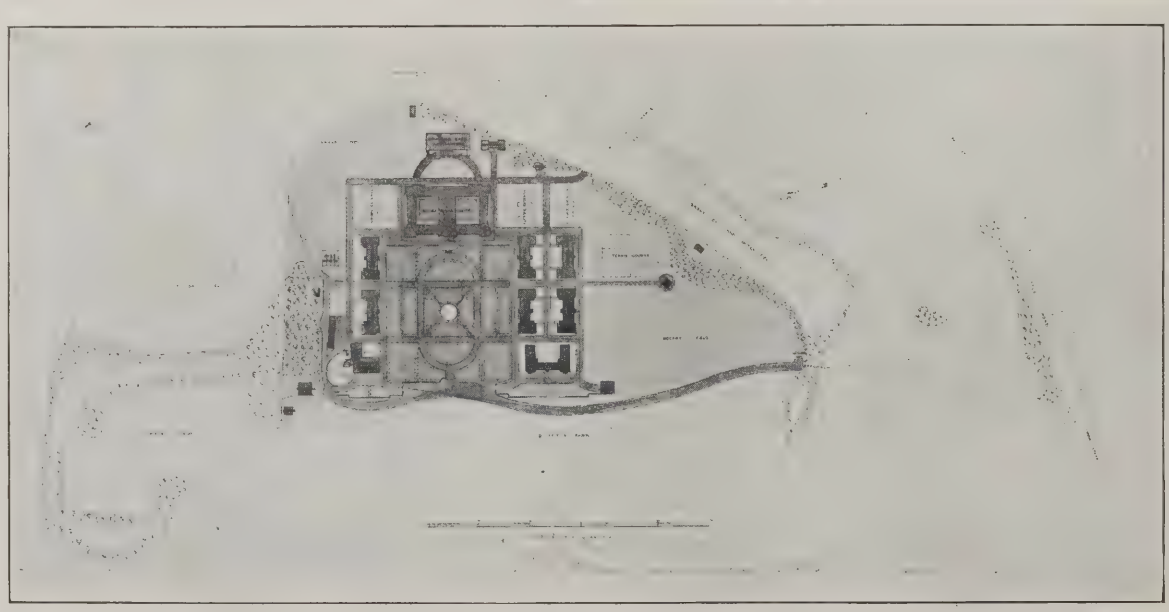
National Federation Executive Council: Messrs. S. Horner, S. B. Depree, F. L. Dove, G. B. Godson, T. Gregory, B. J. Grover, J. W. Lorden, F. M. May, F. G. Rice, and A. W. Turnbull.

National Federation Administrative Committee: Messrs. B. I. Greenwood and W. Shepherd.



Employers' Parliamentary Council: Mr. B. I. Greenwood.

The question of members being allowed to start at an earlier hour than that set out in the Working Rule Agreements was considered.

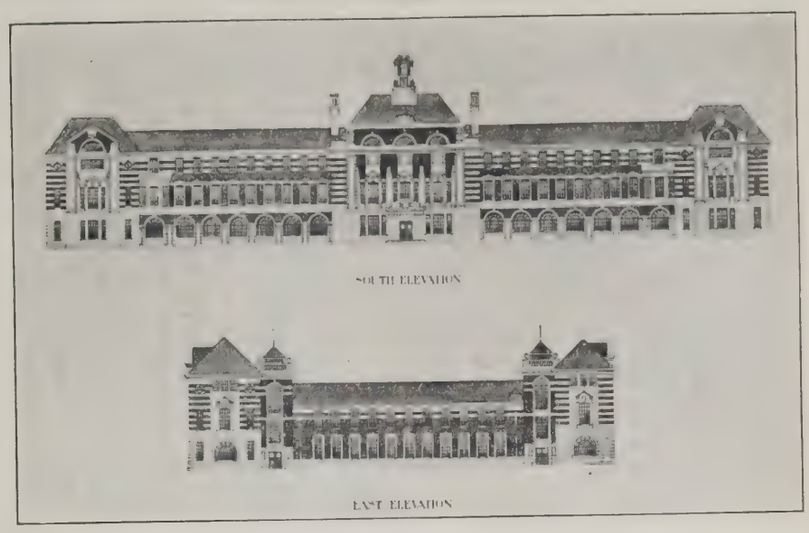


Copies of the hand-book were reported to have been sent to members of the R.I.B.A. and quantity surveyors practising in London.

Much correspondence on trade matters was read and discussed, and new members were elected.

Regulations with regard to applications under Part III. of the L.C.C. (General Powers) Act, 1908, recommended by the Building Act Committee of the L.C.C. together with the proposed charges to be made by the Port of London on lighterage were referred to the Emergency Committee for consideration and report.

CITY OF LEEDS TRAINING COLLEGE AT FAR HEADINGLEY. DESIGN SUBMITTED BY PERCY ROBINSON, F.R.I.B.A., AND E. ALBAN JONES.



CITY OF LEEDS TRAINING COLLEGE AT FAR HEADINGLEY. BLOCK PLAN OF DESIGN SUBMITTED BY PERCY ROBINSON, F.R.I.B.A., AND E. ALBAN JONES.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Mar. 21.	PARISH COUNCIL OFFICES, BLAWARTHILL. Architects are invited to send in plans and estimates of the probable cost of Offices to be erected for the Renfrew Parish Council at Blawarthill, Roker Road, near Scotstoun West Station. A sketch of the Site and other particulars can be had from the Clerk to the Council at 1, Manse Street, Renfrew, on payment of a fee of ten shillings, which will be refunded on receipt of a bona-fide set of plans, on or before 21st March. *No Premium will be paid to Competitors, and the Council does not bind itself to accept any plan sent in.*
Mar. 31.	SHEFFIELD ENDCLIFFE PARK CHURCH. Plans desired for Church for 650, Institute for 150, Primary Department for 125, Junior Department for 95, and Caretaker's Apartments. Premium, not merged in commission, £35. Assessor, Chas. Hadfield, Esq., F.R.I.B.A., Delivery on March 31. On receipt of 5s. the Secretary, J. W. Nicholls, 64, Everton Road, Brocco Bank, Sheffield, will furnish conditions and instructions with plan of site, showing existing buildings, levels, and drainage—these not returnable. Deposit returned only to those who send plans.
Mar. 31	MUNICIPAL OFFICES, KARACHI. The Municipality offer a premium of 7,500 rupees (£500) for the best design, detailed plans and estimates for new Municipal Offices. Cost not to exceed 500,000 rupees, and the style of architecture is left open to the designers. Ferrotype plans of the site and a general arrangement of the floors of the building showing the accommodation to be provided, together with a copy of instructions to architects, will be supplied to intending competitors on application to the Chief Officer and Chief Engineer, Karachi Municipality. A charge of Rs. 5 will be made therefor, which will not be refunded. Each set of drawings must be sent in anonymously, but accompanied by a sealed envelope containing the author's name and address. Each set of drawings and all the documents required, including the sealed envelope, must be securely packed in a wooden box, addressed as follows:—The Chief Officer and Chief Engineer, Karachi Municipality, Karachi, India, and forwarded, at the competitor's own risk and charges, in time to reach the Chief Officer on or before the 31st day of May, 1910. It is proposed to apply to Government for permission for one of the chief architects to act as assessor to decide on the design to which the prize shall be awarded. The final decision of the assessor will be final and not open to dispute. The decision of the Municipality will be made within three months of the latest date for submission of designs, and payment of one-half of the premium will be made thereafter to the author of the selected design, the balance to be paid when the further details specified in the instructions to architects have been supplied. On payment of the premium the Municipality will have all rights in the design, with power to erect the building under its own agency, either according to the design selected or with such additions or alterations as it may deem necessary.
No Date.	COVENTRY NEW PUBLIC ELEMENTARY SCHOOL. ENLARGEMENT OF STOKE COUNCIL SCHOOL. The Education Committee invite competitive sketch plans for a proposed New Public Elementary School in Centaur Road, and a proposed enlargement of Stoke Council School. The competition in each case is strictly limited to architects practising in the City of Coventry. Particulars of the competition may be obtained by any architect wishing to compete, on application at the Education Offices, Priory Row.
No date.	ELEMENTARY SCHOOL, BLOXWICH, for the County Borough of Walsall Education Committee. Designs are invited for the erection of a Public Elementary School (mixed) to accommodate 500 children, at Bloxwich. Conditions of competition and plan of site from W. Dawson Sadler, M.A., Director of Education, Council House, Walsall.
No date.	*SECONDARY SCHOOL AT PETERBOROUGH, for Soke of Peterborough Education Authority, to accommodate 250 scholars, but allowing for enlargement so as to accommodate 300 scholars. Particulars of the general instructions and conditions, together with a plan of the site, may be obtained on application to Walter J. Deacon, Clerk to the Authority, Cross Street, Peterborough. **We have received a letter from a correspondent saying that having applied for the particulars, these have been refused on the ground that a sufficiently large number had already been issued.*

SOUTH ELEVATION

EAST ELEVATION

CITY OF LEEDS TRAINING COLLEGE, FARR HEADINGLEY.
DESIGN SUBMITTED BY PERCY ROBINSON, F.R.I.B.A., AND E. ALBAN JONES.

Macclesfield Elementary School.

The plans of Messrs. Whittaker and Bradburn, of Macclesfield, have been accepted by the Eduation Committee. These were submitted in competition with three other designs. The plans and reports were referred for consideration to the assessor, Mr. A. R. Wood, architect to the Tunstall and Burslem Education Authorities, whose report was unanimously adopted. The school will give accommodation for 760 in a mixed department, and 300 infants in a separate department.

The Blackley Estate, Manchester.

The Blackley Estate Special Committee of the Manchester Corporation has lately been considering the question of obtaining competitive designs for the laying out of the estate, and it has now been decided to invite architects and others to submit plans, specifications, and estimates. A premium of £150 will be paid by the Corporation for the best plan, £100 for the second, and £50 for the third. The selection will be made by an assessor appointed by the committee. Sketch plans of cottages suggested are to be sent with the general plan of the laying out of the estate. Cottages in the main are to be semi-detached, with a view to avoiding the formation of back streets, and there must not be more than 20 cottages per acre of land. Every cottage must have a bath, some two, and some three bedrooms. A recreation ground, bowling green, tennis courts, and children's playgrounds are to be provided, and the sites indicated for schools, library, reading-rooms, clubs, churches, and chapels.

Belfast University New Buildings.

The Senate has decided to organise a competition open to architects in the United Kingdom for the following new buildings:—(a) A new science block for the accommodation of the departments of physics, botany, zoology, and geology, £22,500; (b) an extension of the existing medical buildings, £8,500; (c) an extension of students' union buildings, £3,000. Sir Aston Webb, R.A., F.R.I.B.A., will act as assessor. The author of the design placed first will be appointed architect, and premiums of £150 and £100 will be awarded to the second and third designs.

Girls' High School, Saltburn.

Messrs. Russell and Cooper's design has been chosen for the girls' high school which the North Riding Education Committee are about to erect at Saltburn. Twenty guineas premium was given to Messrs. F. J. Erdle and Meyers, of London Bridge Railway Approach, and a premium of ten guineas to Messrs. R. Evans and Son, of Eldon Chambers, Nottingham.

SHEFFIELD MASTER BUILDERS' ASSOCIATION.

The monthly meeting followed immediately after the annual meeting, on February 10th, with Mr. W. Longden in the chair.

A report was given of the last meeting of the Conciliation Board which had again spent considerable time in trying to adjust with the operatives the question of walking time, which the association had given notice to abolish. A resolution was proposed by the operatives that the wages of all joiners and bricklayers be advanced ¼d. per hour, this to constitute a settlement of all questions, but this the employers' section of the Board could obviously not accept as it would increase the wages of all joiners, whereas the previous walking time was not applicable in 10 per cent. of jobs. As an amendment the employers' section moved that their previous resolutions in regard to jobs over 2½ miles from the Parish Church and also over 4 miles become the rule. The voting resulted in a tie, as it did also on a further resolution from the operatives to the effect that 1s. per week be allowed for car fares on all jobs beyond the 2½ miles' radius up to 4 miles, the rule to apply to all men whether set on on the job or sent from the contractors' yard, and the matter was then sent as an appeal from both sides to the Northern Centre Conciliation Board, which sat at Leeds on February 21st. The case for the employers was put by Mr. A. J. Forsdike and the secretary; Mr. T. Roper and Mr. Wm. Longden also being present as witnesses, while Mr. J. Biggin had a seat on the Board. For the operatives the case was stated by Messrs. W. Lane and J. T. Welburn on behalf of the joiners, and by Messrs. J. Emerson and F. Limage on behalf of the bricklayers. After considerable discussion, the following was given as the decision of the Board:—

(*a*) Boundary and Walking Time.—The boundary in Sheffield shall be taken at 2½ miles from the Parish Church in any direction, beyond which 1s. per week shall be paid up to and including 4 miles. This rule to apply to men sent from the shop and not to men engaged and paid on the job.

(*b*) Country Work.—All men sent out on country jobs shall have their travelling expenses and time paid going and returning if discharged or sent back to the shop, and three shillings per week for lodgings. Any allowance beyond this to be by special arrangement.

(*c*) Joiners' Overtime.—This rule shall be amended to read as follows: "The first two hours shall be computed at time and a quarter. If required to work beyond that time the men shall be paid time and a half, also time and a half from Saturday afternoon at 1 o'clock until 5 p.m., and from 5 o'clock on Saturday afternoon until 7 o'clock on Monday morning, double time: the same allowance for meals as in ordinary time. Christmas day to be paid for as Sunday.

(*d*) Bricklayers' Notice.—That one hour's notice shall be given to either employer or employee on leaving, the same to expire at 12 o'clock noon, or at the end of the day's work.

With the exception of the clause in regard to joiners' overtime, the decision is in exact agreement with the contention of the association, and it is satisfactory that after the matter has been discussed for 12 months, the Association has got all it asked for.—THOS. SMITH, secretary.

Coming Events.

Wednesday, March 9.

CARPENTERS' HALL LECTURES.—Mr. Halsey Ricardo on "The Use of Coloured Materials in Building," 7.30 p.m.

MANCHESTER SOCIETY OF ARCHITECTS.—Special General Meeting: 6.30 p.m., Exhibition of Students' Drawings and Distribution of Prizes.

NORTHERN ARCHITECTURAL ASSOCIATION.—Opening of the R.I.B.A. Exhibition of Prize Drawings. Business meeting, 7.30 p.m. Annual meeting of Students' Classes Club and Students' Sketching Club, 8 p.m.

ROYAL SANITARY INSTITUTE.—Mr. E. J. Steegmann on "Elementary Science," 7 p.m

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about **five days** or longer after the date of this issue.
Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders.
The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the Contract, which requires them to pay the rates of wages current in the district.

BUILDING.

March 2-15. **WHITLEY BAY.**—Erection of a new Council school, to accommodate 600 scholars, and a caretaker's dwelling-house, at Whitley Bay, for the Northumberland Education Committee. Contractors should forward particulars, name and address to the undersigned not later than March 2, together with a deposit of £2 2s. for specification and bills of quantities. Plans may be inspected at the office of Marshall and Tweedy, Architects, Eldon Square, Newcastle-on-Tyne. Tenders must be forwarded to C. Williams, Secretary to the Education Committee, The Moothall, Newcastle-on-Tyne.

March 14. **DRUMCREE.**—Erection of a residence at Drumcree, Portadown. Drawings and specification may be seen at the offices of J. W. Walby, Architect, to whom tenders must be sent

March 14. **BRYNMAWR.**—Pulling down and erecting new business premises, for P. James. Drawing, etc., may be seen at office of Hy. Waters, M.S.A., Architect, Market Chambers, Ebbw Vale.

March 14. **EXMOUTH.**—Erection of detached house near Woodbury Road Station, for J. L. Langworthy. Drawings and specifications may be obtained from Ernest E. Ellis, Architect, Exmouth, to whom tenders must be sent.

March 14. **BLAINA.**—Repairs, renovations, painting, and papering at the Castle Hotel, for D. F. Pritchard, Ltd., brewers, Crumlin. Further particulars are obtainable at the office of Mr. Hy. Waters, M.S.A., Architect, Market Chambers, Ebbw Vale.

March 14. **BILSTON.**—Alterations to the assembly room and approaches at the Town Hall, Bilston, for the U.D.C. Specification and form of tender may be obtained upon application to Vincent Turner, Engineer and Surveyor, Town Hall, Bilston.

March 14. **WINDYGATES.**—Erection of hall and houses at Windygates, for the L.O.A. Shepherds. Schedule of quantities may be obtained on application to G. Charles Campbell, Architect and Surveyor, Methil, near Edinburgh, and on the depositing of £1 1s.

March 14. **CHESTER.**—New female epileptic ward at the Upton Asylum, for the Visitors Committee. Plans and specifications can be seen at the office of H. Beswick, F.R.I.B.A., County Architect, Newgate Street, Chester, and quantities obtained on deposit of £1. Tenders are to be delivered to Alex. Hornby, Clerk to the Visitors, Upton Asylum, Chester.

March 14. **MEXBOROUGH.**—Erection of six almshouses, and other works incidental thereto, at Church Street, Mexborough, for the U.D.C. Plans may be seen and a copy of the particulars and bills of quantities obtained at the Council offices on deposit of £1. Tenders are to be sent to G. Fenwick Carter, C.E., Surveyor to the Council, Council Offices. Fair wages clause.

March 14. **HULL.**—Erection of a school in Southcoates Lane, for the Corporation. Drawings and specification may be seen, and quantities obtained upon deposit of £2 2s. with Joseph H. Hirst, City Architect, Town Hall, Hull. Remittances to be made payable to the City Treasurer. Tenders are to be addressed to the Secretary of Education, and delivered at the Education Offices, Hull.

March 14. **SHEFFIELD.**—Erection of new infant department for 468 places at Owler Lane Council school, for the Education Committee. Drawings and conditions of contract may be seen, and bills of quantities and forms of tender obtained, on application to the City Architect, at the Town Hall, Sheffield. Tenders to be delivered at the Education Offices, Leopold Street. Fair wages clause.

March 14. **CRUMLIN (Mon.).**—Erection of a new Council school, to accommodate 600 children, for the Monmouthshire Education Committee. Plans and specification may be seen and bills of quantities obtained at the office of John Bain, architect, County Council Offices, Newport, on payment of a deposit of £2 2s. Tenders to be sent to C. Dauncey, Secretary, County Council Offices, Newport, Mon.

March 14. **EDINBURGH.**—Execution of mason and brickwork, carpenter and joiner, glazier, slater, plasterer, plumber, smith, and painter's work for the erection of hall and houses at Windygates for the L.O.A. Shepherds. Schedule of quantities may be obtained on deposit of £1 1s., with G. Charles Campbell, Architect and Surveyor, Methil. Offers to be lodged with Alexr. Mackie, Sec., L.O.A.S., 1, India Buildings, Edinburgh.

March 14. **FRIZINGTON.**—Erection and completion of the following gasworks buildings, for the U.D.C., viz.:—Retort house, coal stores, manager's house, and other buildings. Plans and specification may be seen, and all particulars obtained from George Ashbridge, Engineer, at the Gasworks Site. Tenders will be received by John Bowly, Clerk to the Council, Council Offices, Frizington.

On deposit of £1 1s. plans and specifications may be inspected and bills of quantities and conditions obtained at the office of the Architect, Frank S. Biram, George Street, St. Helens. Tenders must be delivered to Percival Sharp, Secretary for Education, Education Office, St. Helens.

March 21. **LEICESTER.**—Erection of new buildings and alterations at the town museum, New Walk, for the Corporation. Bills of quantities may be obtained at the offices of the Architects, Tait and Herbert, M.R.I.B.A., 18, Friar Lane, Leicester, upon deposit of £1 1s. Tenders to be addressed, "The Chairman, Museum and Art Gallery Committee, Town Hall, Leicester," and delivered to H. A. Pritchard, Town Clerk, Town Hall. Local firms only invited.

March 21. **RAMSGATE.**—Erection of a caretaker's cottage on the premises of the Ramsgate Secondary School, for the Kent Education Committee. Plans and specification and form of contract may be inspected at the offices of the committee, until the time appointed for the delivery of the tenders. Any person desiring to tender and to receive a copy of bills of quantities must send in his name to Fras. W. Crook, Secretary, Caxton House, S.W., accompanied by a deposit of £1, not later than March 10, 1910. Tenders must be delivered at the offices of the committee, Caxton House, Westminster, S.W.

March 21. **GLASGOW.**—(1) Structural steel work; (2) builder's work; in connection with the provision of a new roof, Glasgow Cathedral, for the Commissioners of His Majesty's Works and Public Buildings. Tenders are requested for separate sections of the work under the above designations (1) and (2). Drawings, specifications, and a copy of the conditions and forms of contract may be seen on application to the Clerk of Works, H.M. office of Works, Head Post Office, Glasgow (Hanover Street entrance). Bills of quantities and forms of tender for the structural steel work and the builder's work respectively may be obtained at H.M. Office of Works, 3, Parliament Square, Edinburgh, on payment of £1 1s. Tenders must be addressed to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

March 22. **FAREHAM.**—Erection of a hospital block at the Isolation Hospital, situate in Fareham, for the R.D.C. Builders and contractors desirous of tendering are requested to forward their names to Mr. Wilberforce Cobbett, Architect, Fareham, accompanied by a deposit of £3 3s., not later than March 12. Tenders to be delivered to Alfred Laker, Clerk to the Council, Union Offices, West Street, Fareham.

March 24. **GLOUCESTER.**—Erection of a new general bath-house on the female side of the second county asylum at Barnwood, near Gloucester, for the Committee of Visitors. Bills of quantities can be obtained from the Clerk of the Works, Wotton Asylum, Gloucester, on payment of £1 1s. Plans and specification can be seen at the office of the Clerk of the Works aforesaid, and also at the office of the Architects, Giles, Gough, and Trollope, 28, Craven Street, Charing Cross, London, W.C. Tenders to be delivered to James Thompson, Clerk to the Visitors, Wotton Asylum, Gloucester.

March 25. **TINSLEY.**—1, constructing a fence wall; 2, wrought-iron railings and gates; for the Parish Council. The above are required for enclosing the recreation ground at Tinsley. Forms of tender and specifications of quantities can be obtained from J. L. Winkley, Clerk to the Council, 15, Harrowden Road, Tinsley, Sheffield, on receipt of stamped addressed foolscap envelope. Plans of the ground and of the work to be done can be seen at the Free Library, Tinsley.

March 26. **STURMINSTER MARSHALL.**—Building a new elementary school at Sturminster Marshall, Dorset, for the C.C. of Dorset Education Committee. Plans and specifications may be seen at the office of the County Surveyor, Wimborne. Tenders to be sent in to the Secretary, County Education Committee, Dorchester.

March 31. **GATESHEAD.**—Erection of the Brighton Avenue new school, for the Education Committee. Send names to the Architect, F. W. Purser, West Street, Gateshead, who will supply quantities. Applicants must deposit a fee of £1 1s. Tenders should be sent to the Education Offices, Gateshead.

March 31. **YSTRADGYNLAIS.**—Alterations and additions to "Maesydderwen," to convert into County schools, for the Governors. Plans, specifications may be seen and bills of quantities obtained from the offices of J. Cook Rees, Architect, Neath. Tenders to be sent to B. L. Thomas, Clerk to the Governors, Tir Roger, Ystradgynlais.

March 31. **BERE ALSTON.**—New elementary school for 124 children at Bere Alston, for the Devon County Education Authority. Bills of quantities will be available in due course on payment of £1 1s. Contractors desiring to tender must apply to the County Architect (Education), 1, Richmond Road, Exeter, not later than the first post on Wednesday, March 9, 1910, enclosing a crossed cheque drawn in favour of the County Treasurer. Quantities will be issued about March 16, and tenders must be delivered at the Architect's office.

March 31. **BROMSGROVE.**—Erection of a Council secondary school, in Stourbridge Road, for the Worcestershire Education Committee. Applications for forms of tender and bills of quantities may be made by March 10, to the County Education Office, Worcester, accompanied by a deposit of £2 2s. The drawings may now be seen at the office of the architect, G. H. Gadd, Town Hall Chambers, Bromsgrove. Tenders must be addressed to the Director of Education, 37, Foregate Street, Worcester.

April 6. **BOVEY TRACEY.**—New elementary school for 200 children, and a cookery and manual training centre, etc., for the Devon County Education Authority. Bills of quantities will be available on payment of £1 1s. Contractors desiring to tender must apply to the County Architect (Education), 1, Richmond Road, Exeter, not later than Friday, March 11, 1910, enclosing a crossed cheque drawn in favour of the County Treasurer. Quantities will be issued about March 22, and tenders must be delivered at the architect's office.

April 6. **EDENBRIDGE.**—Erection of a new Council school to accommodate 200 children, for the Kent Education Committee. Plans and specification, and form of contract, may be inspected at the offices of the Committee, until the time appointed for the delivery of the tenders. Any person desiring to tender and to receive a copy of bills of quantities must send in his name to Fras. W. Crook, Secretary, Caxton House, Westminster, S.W., accompanied by a deposit of £1, not later than noon on March 10, 1910. Tenders must be delivered to the School Correspondent, Chas. Sheal, High Street, Edenbridge, Kent.

No date. **BUCKHAVEN.**—Mason and brickwork required in connection with the erection of a public slaughter house, etc., for the T.C. Forms of tender, schedules of measurement, and any other information required can be had from William D. Telfer, Burgh Surveyor, Municipal Buildings, Buckhaven, on payment of a fee of £1 1s.

No date. **PETERSTONE.**—Erection of two houses for Mr. W. H. Smith and Mr. E. Dobbins respectively at Glyn-Cory Garden Village. Plans and specification may be seen and particulars obtained at the office of the Estate Agent, Wm. R. Jackson, 18, Queen Street, Cardiff.

No date. **CARDIGAN.**—Carrying out improvements and repairs to the following Council Schools, for the County Education Committee:—Painters' and carpenters work at Scyborycoed; builders' and carpenters' work at Llancynfelin; builders' and masons' work at Comminscoch. Plans and specifications can be seen and full particulars obtained from the respective head teachers, or from the office of Geo. Dickens-Lewis, County Architect, Aberystwyth, to whom tenders must be sent.

No date. **TORQUAY.**—Erection of new town hall and municipal buildings, for the T.C. Builders and contractors desirous of tendering are invited to forward their names, with a deposit of five guineas, to Fredk. S. Hex, Town Clerk, Torquay, Town Hall, Torquay, on or before March 19, 1910, after which, in due course, copies of the specification, bills of quantities, conditions of contract, and form of tender will be supplied by the architect, Thomas Davison, 28, Great Ormond Street, London, W.C.

No date. **LOUGHTON.**—Erection of a public elementary school with the accommodation for 316 girls in the Staples Road, for the Essex Education Committee. Plans and specifications can be inspected at the office of H. Tooley, F.R.I.B.A., Buckhurst Hill. Applications to tender must be made to Herbert J. Goodwin, Clerk of District Sub-Committee, High Road, Loughton, in writing, on or before March 16, 1910. A deposit of £4 4s. must be sent with the application, and bills of quantities will be provided. Surety of £500 required.

ENGINEERING.

March 14. **ASHBY-DE-LA-ZOUCH.**—New sewers, including manholes, lampholes, ventilators, and other works connected with same:—Approximately 1,224 lin. yards of 6in. stoneware pipe sewers; approximately 655 lin. yards of 9in. stoneware pipe sewers; approximately 1,710 lin. yards of 12in. stoneware pipe sewers; total length, 3,589 lin. yards, or 2 miles 69 yards. Also concrete tanks, carriers, filters, sludge pits, the preparation of about 4 acres of land, effluent drains, the connections of private drains, and other works connected therewith, for the R.D.C. The plans and details may be inspected at the offices of the Engineer, Mr. Thomas I. McCarthy, Central Chambers, Coalville, near Leicester, from whom conditions, specifications, bills of quantities, and form of tender may be obtained upon payment of £5 5s. Tenders must be delivered to George Farmer, Clerk to the Rural District Council, Ashby-de-la-Zouch. Sureties required.

March 15. **CREWE.**—Diversion of watercourse and construction of retaining walls, etc., for the Corporation, in connection with sewerage and sewage disposal works in the borough, in accordance with plans, sections and specifications which may be seen, and all information obtained, upon application to G. Eaton-Shore, Borough Surveyor, Earle Street, Crewe. A deposit of £2 will be required, and tenders must be delivered to H. S. K. Feltham, Town Clerk, Municipal Offices, Crewe.

March 19. **BIRMINGHAM.**—Providing and fixing laundry machinery at the new Laundry Block, Birmingham Workhouse, for the Guardians. Plans and specifications can be seen at the offices of the architects, W. H. Ward, Paradise Street, Birmingham. Copies of plans and specification will not be supplied. Tenders must be sent to Charles Fletcher, Clerk to the Guardians, Parish Offices, Edmund Street, Birmingham. Fair wages clause.

March 24. **VAYNOR AND PENDERYN.**—Construction of about 4½ miles of 12in., 9in., and 6in. stoneware and cast-iron pipe sewers, together with manholes, lampholes, tumbling bays, flushing chambers, and ventilating shafts, together with other appendages and works, for the R.D.C. Drawings and specification may be seen and bills of quantities and form of tender obtained of Frank T. James, Clerk to the Council, on payment of £1 1s., No. 134, High Street, Merthyr Tydfil, to whom tenders must be sent.

March 29. **MANCHESTER.**—Laying and jointing of the Southern Section of the third line of pipes from Thirlmere to Manchester, for the Corporation. Works will extend from about three-quarters of a mile north-west of Lostock Junction Station of the Lancashire and Yorkshire Railway to the Audenshaw Reservoirs of the Corporation, and consist of nearly twenty-three miles of cast-iron and steel pipes, 44in. and 40in. diameter, the construction of a tunnel 550 yards long, nine subways under railways and canals, nine bridges under and over railways, valve houses, discharge wells, and outlet works, the fixing of valves and ironwork, and other work connected with the third line of pipes. Plans and drawings may be seen, and printed specification, schedule of quantities, and form of tender obtained at the offices of G. H. Hill and Sons, Civil Engineers, Albert Chambers, Albert Square, Manchester, and 3, Victoria Street, Westminster, on receipt of cheque for £5 5s. A limited number of drawings (uncoloured), excluding ordnance maps, are available, and will be lent to persons tendering in priority of application on receipt of £5 5s. (not returnable). Tenders, addressed to the Chairman of the Waterworks Committee, must be forwarded to the Secretary, Waterworks Offices, Town Hall, Manchester.

No date. **ROTHERHAM.**—Contractors desirous of submitting schemes and tenders for (a) heating and (b) ventilating (either or both) of the South Grove Upper Standard School, for the Borough Education Committee, are requested to send their names to Spurley Hey, Director of Education, Education Offices, Rotherham, not later than Wednesday, March 16, 1910. From the list of names sent in the committee will select a certain number of firms who will be asked to submit schemes and tenders.

IRON AND STEEL.

March 14. **DURBAN (NATAL).**—Supply and delivery "free on board" of about 100 tons of steel girder rails, fish plates, bolts and nuts, for the Corporation. Specifications may be obtained from Webster, Steel and Co. (Agents to the Corporation), on deposit of £2 2s. Tenders to be delivered to Webster, Steel and Co., Agents to the Durban Corporation, 5, East India Avenue, Leadenhall Street, London, E.C.

March 15. **MANCHESTER.**—Supply of:—Manual valves, 40ins. and 36ins. diameter; automatic valves, 36ins. diameter; reflux valves, 40ins. diameter; sluice valves from 18ins. to 3ins. diameter; air valves; and miscellaneous ironwork, for the Corporation. Specification and form of tender may be obtained on application to G. H. Hill and Sons, Civil Engineers, Albert Chambers, Albert Square, Manchester, and 3, Victoria Street, Westminster, upon receipt of cheque deposit £2 2s. Tenders addressed to the Chairman of the Waterworks Committee, must be forwarded to the Secretary, Waterworks Offices, Town Hall, Manchester.

PAINTING.

March 14. **EAST PRESTON (Sussex).**—External painting and other works, at the workhouse, for the Guardians of East Preston Union. Specification can be seen at the Workhouse. Tenders to be addressed to the Chairman of the Board of Guardians, East Preston, near Worthing.

March 14. **SOUTHALL.**—Painting, whitewashing, repairs, etc., at the St. Marylebone School, Southall. Specifications and form of tender may be obtained any day from March 7 to March 9, upon application to the Guardians' Architect, Mr. A. Saxon Snell, of 22, Southampton Buildings, Chancery Lane, W.C., depositing with him a £5 Bank of England note. Tenders to be addressed to Henry T. Dudman, Clerk to the Board of Guardians, Guardians' Offices, Northumberland Street, Marylebone Road, W.

(*Continued on next page.*)

A Practical Example

of the advantages of the use of . . .

TERRA COTTA

in large smoky towns may be seen in the adjoining illustration of the London Coliseum, which has recently been cleaned down with a steam brush.

The building was erected 5 years ago and the amount of dirt deposited on a building in the centre of London is clearly shewn by the unwashed portions.

The Terra Cotta used was ordinary hard burned stone colour supplied by

THE HATHERN STATION BRICK & TERRA COTTA CO., Ltd.,

of LOUGHBOROUGH,

who will be pleased to send estimates for work and samples of their various colours on receipt of quantities or drawings.

Telephone: 611 Loughborough. Telegrams: Bricks, Hathern Station.

March 14. **GOSFORTH (Newcastle-upon-Tyne).**—Painting work, for the Committee of Visitors of the Newcastle-upon-Tyne City Lunatic Asylum. Form of tender may be had on application to the Clerk of the Asylum, and must be addressed to the Chairman and Members of the Tenders Committee of Visitors.

March 16. **LONDON.**—Repairing, maintaining, and decorating police stations, police courts, houses, buildings, etc., situated within four miles of Charing Cross, for a period of three years, from April 1, 1910, for the receiver for the Metropolitan Police District. Printed forms of tender may be obtained on payment of the sum of £1 1s. (which will not be returnable) at the office of the Police Surveyor, New Scotland Yard, S.W.

March 22. **WEST STANLEY.**—Painting the following schools for the Durham County Education Committee:—South Moor Council, mixed and infants' schools; Greencroft Council, mixed; Annfield Plain Council, infants; Hare Law, mixed and infants; Causey Row, mixed and infants; East Stanley infants, West Stanley senior, and West Stanley infants. Specifications, etc., may be obtained from E. G. Chatt, Station Road, West Stanley.

PLUMBING AND SANITARY

March 14. **HORNCASTLE.**—Supplying and fixing new bath in the males' receiving ward at the Workhouse at Horncastle, for the Board of Guardians. Specifications can be seen at the Union Offices, Church Lane. Tenders to be delivered to J. E. Chatterton, Clerk to the Guardians, Union Offices, Horncastle.

March 14. **STANHOPE.**—Laying 3,160 yards or thereabouts of main sewer and the construction of tanks, filters, and irrigation area for sewage disposal purposes at Stanhope, for the U.D.C. Plans and specifications may be seen and quantities and forms of tenders and other information obtained on application to the Council's Engineer, J. S. Parker, A.M.I.C.E., Post Office Chambers, St. Nicholas Square, Newcastle-on-Tyne, or the Council's Surveyor, J. R .Ridley, Town Hall, Stanhope. Deposit of £1 required. Tenders should be sent to F. H. Thompson, Clerk to the Council, Stanhope.

March 20. **GRESSENHALL.**—Alterations to the Workhouse drainage, for the Mitford and Launditch Union, in accordance with the plans and specifications, which may be seen at the office of W. John Barton, Clerk to the Guardians, The Guildhall, East Dereham, to whom tenders must be sent.

No date. **BURNLEY.**—Labour in overhauling the land drains on The Lodge Farm, Brunshaw, Burnley. Apply by letter, or personally, between the hours of 11 a.m. and 1 p.m., to Mr. A. Stewart, 5, Yorke Street, Burnley, from whom particulars may be obtained.

ROADS AND CARTAGE.

March 14. **BILSTON.**—Supply and delivery of Rowley rag macadam, setts, and kerbs, for twelve months, commencing April 1, 1910, for the U.D.C. Specifications and form of tender may be obtained upon application to Vincent Turner, Assoc.M.I.C.E., Engineer and Surveyor, Town Hall, Bilston.

March 14. **STREATHAM.**—Making-up and paving Penwortham Road, Streatham, for the Corporation of Wandsworth. Specifications and drawings may be seen, and forms of tender obtained, at 56, East Hill, Wandsworth, S.W., upon deposit of £5 5s. Tenders must be delivered at the Council House, East Hill, Wandsworth, S.W. Fair wages clause.

March 14. **LEEDS.**—Paving and flagging the following private streets, for the Corporation:—Burton Avenue (part), Fairford Avenue, Fairford Terrace, Primrose Lane, Longroyd Street, Longroyd Place, Longroyd Grove, Back Longroyd Terrace, Roseville Street, and Ivy Grove; also paving and flagging improvement in Low Road. Drawings may be seen at the City Engineer's Office, Municipal Buildings. Forms of tender and bills of quantities may be obtained and copies of documents inspected on application at the Highways Office, 155, Kirkstall Road, Leeds. Tenders must be delivered at the Town Clerk's Office, Town Hall, Leeds.

March 15. **THURNSCOE.**—Supply of materials for the year ending March 31, 1911: Broken granite, granite chippings, handbroken slag, slag screenings, flags, kerbs, setts, asphalte, pipes, etc., for the U.D.C. Forms of tender may be obtained from J. Ledger Hawksworth, Clerk, Bolton-upon-Dearne, Rotherham, to whom tenders must be sent. Samples to be forwarded to R. Higginbottom, Surveyor, Thurnscoe.

March 15. **BRISTOL.**—Construction of a new road, about 800 yards in length, in the parishes of Nempnett and Winford, for the Clutton R.D.C. Specification on application to the Council's Surveyor (T. Orchard, The Grange, Haliatrow, near Bristol), by deposit of £1 1s. Tenders must be sent to J. Sumner Dury, the Clerk to the Council, Temple Cloud, near Bristol. For further information apply to the Surveyor.

March 16. **CHISWICK.**—Making-up of parts of Park Road (from Burlington Lane to Hardwick Road). Forms of tender can be obtained on application to E. Willis, A.M.I.C.E., Surveyor, Town Hall, Chiswick, where the plans, specification, form of contract and bond, may be inspected. Tenders to be sent to Ernest F. Collins, Clerk of the Council.

March 16. **EASINGWOLD.**—Supplying whinstone, slag, etc., according to order, stating price per ton for unbroken, machine broken, and hand broken (the broken to be supplied in cubes small enough to pass through a 2½in. ring) for which the same will be delivered free at the various railway stations, for the R.D.C. Tenders must be sent to F. J. H. Robinson, Clerk, Easingwold.

March 16. **MIDDLESEX.**—Supply of about 12,000 tons (more or less) of 2in. and 1½in. basalt or granite; 2,000 tons (more or less) of ½in. chippings, to be delivered free to various stations in Middlesex, for the C.C. Particulars, with specification and form of tender, may be obtained of H. T. Wakeham, M.Inst.C.E., County Engineer and Surveyor, Middlesex Guildhall, Westminster, S.W. Tenders must be sent to the Clerk of the County Council, Middlesex Guildhall, Westminster, S.W.

March 16. **MIDDLESEX.**—Cartage of about 12,000 tons (more or less) of broken stone, 2,000 tons of chippings, and about 4,000 tons (more or less) of gravel, from various railway stations and local pits in the districts of Barnet, Bedfont, Cowley, Cranford, Edgware, Enfield, Hampton, Harlington, Harmondsworth, Harrow, Hayes, Hillingdon, Potter's Bar, Southall, Stanmore, Wembley, and Wood Green, for the C.C. Particulars and forms of tender may be otained of H. T. Wakeham, M.I.C.E., County Engineer and Surveyor, Middlesex Guildhall, Westminster, S.W. Tenders must be sent to the Clerk of the County Council, Middlesex Guildhall, Westminster.

March 16. **ELHAM.**—Supply and delivery of road materials, for the R.D.C., in the undermentioned parishes. Particulars and forms of tender may be obtained from the Surveyor, Lyminge, Kent. Acrise, 100 yards of flint; Elham, 320 yards of flint; do., 100 yards (broken) rock; Hawkinge, 200 yards of flint; Lyminge, 420 yards of flint; do., 40 yards (broken) rock; Lympne, 240 yards of flint; do., 80 yards of beach; Monks Horton, 220 yards of flint; Newington, 100 yards of flint; Paddlesworth, 80 yards of flint; Postling, 120 yards of flint; Saltwood, 60 yards of flint; Sellinge, 200 yards of flint; Stanford, 140 yards of flint; Stowting, 200 yards of flint; Swingfield, 40 yards of flint. All tenders are to be sent to the Clerk's Office, 29, Bouverie Square, Folkestone.

March 17. **THANET.**—Supply of:—2,394 yards broken flints, 1,364 tons broken granite, for the R.D.C. Forms of tender may be obtained by writing for them (enclosing stamped addressed foolscap envelope) to Mr. G. L. Butterworth, Surveyor, Birchington. Tenders to be sent to Chas. Taylor, Clerk, Board Room, Minster, near Ramsgate.

March 17. **LANCHESTER.**—Supply of about 12,500 tons of limestone, 4,100 tons of whinstone, and 1,190 tons of slag, during the year ending March 31, 1911. Tenders are also invited for cartage of the above. Forms of tender may be obtained from W. Cumming, Highway Surveyor, Surveyor's Office, Lanchester, Durham, to whom tenders must be sent.

March 18. **HONITON.**—Maintenance and repair of the district roads within the parish of Southleigh, for the R.D.C., for one year from March 31, 1910. Specifications, schedules of quantities, and forms of tender can be obtained on application to E. W. Hellier, Clerk to the Council. The surveyor (Mr. W. North, Alfington, near Ottery St. Mary), will give any further information.

March 18. **EASTRY.**—Supply and delivery of surface and approved dry flints on the various roads in the district and recarting stones from depots. Also for steam rolling with ten ton rollers, for the R.D.C. Forms and tenders and schedules of quantities may be obtained of the District Surveyor, D. E. Foster, Hazel Bank, Eastry, Dover, or the Assistant Surveyor, W. Goodsell, Durlock Road, Ash, Dover. Tenders must be delivered to F. S. Cloke, Clerk to the Council.

March 18. **TADCASTER.**—Carting stone, and other material from the various railway stations and wharfs to and in the various parishes throughout the district; also supply of broken granite or whinstone, slag, tar, macadam, and stores, for the year ending March 31, 1911, for the R.D.C. Forms may be obtained from Thomas Scott, Council's Surveyor, Aberford, Leeds. Samples of materials and stores to be forward to the Union Workhouse, Tadcaster. Tenders to be sent to Geo. A. Bromet, Solicitor, Clerk to the Council, Tadcaster.

March 19. **WHITBY.**—Quarrying or breaking all or any quantity of stones, carting on to the highways, and laying during the year ending March 31, 1911, in several townships, for the R.D.C. Forms of tender and further particulars may be obtained of John Lyth, District Surveyor, Whitby, to whom tenders must be sent.

March 23. **GATESHEAD.**—Tenders are invited for the supply of materials for the term of one year, for the Corporation:—Rough whinstone, whin chippings, limestone chippings, whin setts, freestone setts, granite setts, whin curb, whin channel, freestone curb and flags, metal, gullies, manholes covers, etc., shovels, picks, scavenging booms, lime and cement. Specification and form of tender can be obtained at the office of N. P. Pattinson, Borough Surveyor, Town Hall.

March 26. **POCKLINGTON.**—Supply of best blue stone and slag for repairing the roads throughout the whole of their district, for the current year, for the R.D.C. The materials to be delivered in such quantities and at such times as the Council may order. Forms of tender with particulars can be obtained from, and all tenders must be sent to, Thomas Robson, Clerk, Pocklington.

March 14. **MIDDLESBOROUGH.**—Supply of sanitary pipes, timber, bricks, concrete flags, and kerbs, Portland cement, annealed scorlae blocks, paving setts, broken macadam and slag, tar macadam, manhole covers and frames, gulley grates, flushing boxes, etc., required from April 1, 1910, to March 31, 1911, for the Corporation. Specifications and schedules may be obtained on application to S. E. Burgess, M.Inst.C.E., Borough Engineer, Borough Engineer's Office, Municipal Buildings, Middlesbrough. Tenders are to be sent to Alfred Sockett, Town Clerk, Municipal Buildings, Middlesbrough.

March 15. **LONDON, W.**—Supply of:—110,000 creosoted Baltic sleepers, 70,000 clean Baltic sleepers, 1,250 loads creosoted Baltic crossing timbers, 750 loads of clean Baltic crossing timbers, for the Great Western Railway. Specifications, with form of tender, may be obtained upon application to G. K. Mills, Secretary, Paddington Station, London, to whom tenders are to be sent.

March 15. **LONDON, S.W.**—Supply of china and earthenware (leadless glaze only), for the period from April 1, 1910, to March 31, 1911, for the Commissioners of His Majesty's Works and Public Buildings. Particulars of the samples and estimated quantities, and a copy of the conditions and form of contract, may be had on application to the Storekeeper, His Majesty's Office of Works' Stores, 12, Lambeth Palace Road, London, S.E. Tenders must be delivered to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

March 15. **STOCKPORT.**—Tenders for Stores.—Supply of general stores for one year from April 1, 1910, to March 31, 1911, for the Gas Committee. —1, bolts and nuts; 2, brushes; 3, brass and meter fittings; 4, cartage; 5, iron castings; 6, drysaltery; 7, retorts and fire goods; 8, glass and putty; 9, iron and steel; 10, ironmongery; 11, mill furnishing; 12, oils and grease; 13, tarred and spun yarn; 14, shovels, pick heads, etc.; 15, timber, English and foreign; 16, tubing; 17, wet and dry ordinary meters; 18, lime. Forms of tender and all further information may be obtained on application to the Engineer, Gas Works, Portwood. Tenders must be addressed to the Chairman of the Gas Committee, and delivered at the Town Clerk's Office.

March 16. **NEWCASTLE-UPON-TYNE.**—Supply of the undermentioned materials during 12 months ending March 31, 1911, for the Corporation:—1, bricks; 2, carbolic acid; 3, cement; 4, clot lime; 5, flags, (artificial), 6, flags (Caithness); 7, flags (freestone); 8, gulley grates, ventilator covers, etc.; 9, hosepipes; 10, iron, steel, and horse shoe nails; 11, kerbstones; 12, leather; 13, lead washings; 14, oils and paints; 15, pitch tar and creosote oil; 16, privy pans and ashbins; 17, road stones; 18, sanitary pipes; 19, scavenging brooms, etc.; 20, shovels; 21, timber. Forms of tender may be obtained on application at the City Engineer's Office, Town Hall. Tenders must be left at the Committee Clerk's Office, Town Hall.

March 16. **MARGATE.**—Supply of all or any of the following articles for the year ending March 31, 1911:—Ironwork, gunmetal, and other castings; paints, oils, colours, etc.; saddlery repairs; ironmongery, tools, brushes, cup leathers, etc.; stoneware sanitary pipes; timber; cement and bricks; flags, kerbs, channelling, patent paving, etc.; tarred Kent rag paving material; cast-iron pipes and special castings; yellow metal fittings; lead, spunyarn, and rubber insertion; valves, hydrants, fittings, and surface boxes; wrought iron and steel tubing and fittings; water meters. Forms of tender and particulars as to samples, etc., can be obtained on application to Ernest A. Borg, Borough Engineer and Surveyor, 13, Grosvenor Place, Margate. Tenders must be delivered to Edward Brooke, Town Clerk, Town Clerk's Office, Margate.

March 17. **FELIXSTOWE.**—Supply and delivery of the following materials during year ending March 31, 1911, for the Felixstowe and Walton U.D.C.:—Asphalte, castings, Fletton bricks, forage, Portland cement, steam coal, stoneware pipes, timber, blue Staffordshire kerbs and channels and paving bricks. Specifications and forms of tender may be obtained on application to H. Clegg, A.M.I.C.E., Surveyor, Town Hall, Felixstowe. Tenders to be delivered at the office of F. B. Jennings, Clerk, Town Hall, Felixstowe.

March 19. **HALIFAX.**—Construction of fourteen percolating filters (8 90ft. and 6 85ft. diameter), at the sewage disposal works, for the Corporation:—22, excavators', masons', and bricklayers' work; 23, cast-iron pipes and sluice valves; 24, distributors (revolving); 25, filtering medium; 26, unloading and filling filtering medium. Plans and specifications may be seen and forms of tender obtained on application to James Lord, M.I.C.E., Borough Engineer, Town Hall, Halifax, upon deposit of £10 for each set of quantities. Tenders must be sent to Herbert Ashling, Town Clerk. Fair wages clause.

March 23. **YNYSCYNHAIARN.**—Supply of:—3, fire-bricks and retorts; 5, pipes and connections; 6, structural ironwork for reconstruction of retort house, etc.; 10, new purifier; for the U.D.C. Specification and schedules of quantities can be obtained from the undersigned, and drawings can be seen at the Council Chambers, or at the office of the Council's Engineer, R. Bruce Anderson, 5, Victoria Street, Westminster. Tenders to be sent to Jno. Jones. Clerk to the Council, Town Hall, Portmadoc.

March 23. **WOOD GREEN.**—Supply of the following materials (among others) and execution of works during the year ending March 31, 1911, as follows, for the U.D.C.:—(1) broken Guernsey granite; (2) flints, hoggin, sand, etc.; (3) stoneware pipes; (4) Portland cement; (7) masons' and paviors' works; (8) asphalte works; (9) tarpaving works; (10) carting of materials, and supply of horses, carts, etc. Forms of tender, with general conditions, may be obtained of Wm. P. Harding, Clerk of the Council, Town Hall, Wood Green, on payment of a deposit of £1, to whom tenders must be sent. Fair wages clause.

March 26. **WORSLEY.**—Supply of the following materials during the twelve months ending March 31, 1911, for the U.D.C.:—Macadam, granite setts, grit setts, granite chippings (cubes), granite kerbs, sandstone kerbs, pitch and creosote oil, stoneware pipes. Forms of tender may be obtained on application to James Howard, Surveyor to the Council, Council Offices, Walkden. Tenders, together with samples of materials, must be delivered to J. Phethean Monks, Clerk to the Council, Council Offices, Walkden.

March 30. **HOO (Kent).**—Supply of the following materials to be delivered on the roads, for the R.D.C.:—Broken granite, unbroken Kentish ragstone, unbroken surface picked flints, unbroken pit flints and hoggin, also carting (day work), and steam road rolling and scarifying. Forms of tender may be obtained of Richard Phillott Smyth, Clerk, Strood, Kent.

J. G. HAMMOND & CO., LTD.

PRINTING CONTRACTORS.

The Acton Competition.

The Acton U.D. Council Education Committee are inviting architects to submit designs for a school to accommodate 850 children. An assessor is to be appointed, but the advertised conditions calmly announce that the premiums *will be awarded to the designs selected by the Committee after their consideration of the Assessor's award.* Moreover, they do not bind themselves to appoint an architect to whom a premium is awarded, even though the selection is reserved to themselves. *Further, the successful architect will be paid a commission of 3½ per cent. and any premium awarded shall merge in that commission.* Surely impertinence could go no further! No doubt the R.I.B.A. Competitions Committee will take the competition up; but in view of the former difficulties between this Council and the R.I.B.A., and their sequel, we have small hope that any satisfactory conclusion will be reached. In this connection we would draw attention to the action of the Warrington Master Builders' Association, which has supported the protest of architects against unfair conditions in the Warrington Elementary School conditions, by intimating to the Town Clerk that the members of the Association will be recommended not to tender for the work unless the unfair conditions are removed. If architects and builders extended support to each other more often, many of the difficulties which continually confront both bodies would speedily disappear. The proposals of the Acton Council are no whit worse than those of many other Councils in the past, more especially in the North; but now that matters are coming so near home it is to be hoped that the R.I.B.A. will be moved to stronger action to ensure proper respect for the architectural profession. The Acton Council would appear to regard architects as slight and inconsiderable hirelings, accustomed to kiss the rod.

Mr. Belloc on Bridges.

London has the most beautiful as well as the ugliest bridge in the world. So says, in effect, Mr. Hilaire Belloc, who has compassed many waters and hath an artistically discriminating eye. "The ugliest bridge in the world," he declares, "runs from Lambeth to Horseferry Road," and he agrees with many other men of taste that Waterloo Bridge is at least the most beautiful in London. Other of his obiter dicta on bridges are that the most historic bridge over the Thames is London Bridge; while Westminster Bridge is "by far the most useful." The most famous bridge for tourists in Italy is the old bridge at Florence; the best known from pictures, the Bridge of Sighs in Venice. The bridge that trembles most is the Bridge of Piacenza; the bridge that frightens most, the Brooklyn Bridge. The most entertaining bridge for him is the Tower Bridge, "which lifts up and splits into two just as you are beginning to cross it." These rather practical excerpts hardly do justice to Mr. Belloc's whimsically philosophical, and at times almost airily poetical essay "On Bridges," in last Saturday's "Morning Post." "Man also," he says, "builds bridges which unite him with Beauty all about. Thus he paints and draws and makes statues, and builds for beauty as well as for shelter from the weather. And man builds bridges between knowledge and knowledge, co-ordinating one thing that he knows with another thing that he knows, and building a bridge from each to each." By-and-bye, perhaps, this habit of co-ordination may lead him to a just combination of architectural with engineering skill, and then we may get the perfect bridge.

Japanese Decorative Art.

Japanese decorative art, long despised by Western races, who would not take the trouble to study and understand it, but now almost universally regarded with admiration, undoubtedly possesses many qualities that Western art cannot rival. It has, for instance, a large measure of that "spirituality" which appears to be peculiar to Oriental art. As Mr. W. Harding Smith said in his lecture at Carpenters' Hall last Thursday, the chief characteristic of the Japanese decorators is that they ignore realistic detail in order to impart life to their work, and for this effect they depend largely on the expressiveness of line. No doubt, as the lecturer remarked, the suppleness of hand acquired through many generations in writing the picturesque script of Japan has been a great factor in promoting the decorative art of the country; the written characters being essentially pictorial. We are here tempted to ask why it is that much, if not most, of the lettering on "strainers" is so deplorably slovenly and inartistic. Ungraceful lettering, especially when it tends, as so much of it does, to illegibility, has a ruinous effect on the appearance of architectural drawings; and if practice on pictographs has given the Japanese so much skill of hand, like results, in minor degree, should make careful attention to lettering well worth the pains.

"That Iniquitous Measure."

At the eighth annual meeting of the Incorporated Association of Property Owners, a speaker called attention to "that iniquitous measure known as the Housing and Town Planning Act." He said that people were not conversant yet "with the full depth to which that measure would descend. They were in for a substantial drainage of their incomes because of this Act. The Association would do good in letting it be known that determined opposition was to be presented to the Act on every possible occasion, and ultimately they would get some redress." It is well that the existence of these views should be made known; and the somewhat uncompromising language in which they are expressed is also a useful indication, although it perhaps rather tends to defeat the speaker's object. The same miscalculated effect would certainly attend "determined opposition to the Act on every possible occasion." Property has its duties, as well as its rights; and a frank recognition and an ungrudging performance of the duties is the surest way of securing due regard for the rights. These rights, however, no longer include absolute power to oppose public improvements on private grounds. The Act, whether regarded in its moral or in its purely physical aspect, makes for greater breadth of view, and against this principle the property-owner will find that "determined opposition on every possible occasion" will be vain and futile. The aim of the Act is certainly not to assail the property owner's rights, but only to take care that his privileges are not exercised to the detriment of the community. To the extent to which it either exceeds or falls short of that aim, it will need amendment. Searching criticism of its details is no doubt extremely valuable, and will in time result in very necessary revision; but "determined opposition" to the Act as a whole is too late to be effectual, although it may easily become obstructive and annoying. Purely sectional interests, such as those represented by the Incorporated Association of Property Owners, would receive more earnest attention if they were more modestly advanced

Works Losses.

We quote the following from a "Progressive" London daily newspaper: "Works Losses. Not only have workmen lost work by the closing of the Works Department, the ratepayers have also lost money. Mr. Edward White, vice-chairman of the Council, was forced to confess that since his party's decision to wreck the department was arrived at, fifty-four contractors have withdrawn their lowest tenders in connection with various contracts. The difference between the lowest tenders in these cases and the prices the Council was ultimately forced to pay for the work it wanted done was £58,127. This is another aspect of the loss sustained by the ratepayers as the result of shutting up that valuable institution." This is the sort of tale to tell to the Marines, who may be supposed not to perceive the falsity of the inference that contractors withdrew tenders for the fun of the thing, or with the either less innocent or more fatuous object of obliging their business rivals. It disregards the plain and true explanation that, in lucid moments, contractors may and do sometimes realise that they have made a mistake in their pricing, and must retire their tenders, and see the job they have tried so hard to get go to a competitor who has been more careful or more lucky. It is absurd, however, to infer that the existence of a Works Department would have prevented withdrawals on the part of contractors who have made mistakes in their tenders, or that the Works Department would have been able to carry out the works at the figures withdrawn. The withdrawal of tenders is such a commonplace incident of business experience that the attempt to attach any sort of significance to these particular instances need not be taken seriously. It was a transparent electioneering device. It is equally misleading to assume that because the Works Department is shut down "workmen have lost work"; unless, indeed, we are to infer that the department made work for its employees, which is a conclusion that would hardly commend itself to the rate-ridden electorate. Here, therefore, our contemporary is on the horns of a dilemma. It must admit either (1) that the department was wasteful, or (2) that the volume of work being the same, workmen have *not* lost work, although the same individuals may no longer have the monopoly of it.

"Disputes and Differences."

We regret to have again to call attention to the question of the engineer for a work being also made sole contractual referee under the contract. This time it is a question of the erection of a suspension bridge at Shrewsbury, and a contractor has sent us the following extract from the conditions of contract. It is to be noted that the Mr. X referred to in the extract (we substitute this symbol for the gentleman's name, because we wish it to be quite clear that we are here concerned with principles, and not with persons) is also engineer for the works to which the contract relates.

"*Disputes and Differences.*"

"Generally as respects every matter, valuation, difference, or question, which is by this Contract or Specification referred to or required or authorised to be determined or decided or settled by Mr. X, whether as Arbitrator, Valuer, Engineer, or otherwise, and as respects every matter, valuation, difference, or question arising under or out of or on reference to this Contract or Specification, whether as to meaning, construction, or effect of any provision thereof (including this present article) or as to whether any matter or thing is or is not provided for or included therein, or as to anything done or omitted under or with reference to this Contract or Specification the following provisions shall have effect, namely:—

"(1) Every such matter, valuation, difference, question or thing shall be determined, decided, and settled by Mr. X alone, and his determination, decision, or settlement shall be final and conclusive and without appeal, and no claim or action shall be made or brought or maintained except upon and for the purpose of enforcing his determination, decision, or settlement. (2) For the purpose of making any such determination, decision, or settlement, Mr. X may proceed without any formal submission, and in such manner as he thinks fit, and with or without hearing Witnesses, Solicitors, or Counsel, and may receive or inform himself of the case or statement of any party orally, or in writing, or partly in one way and partly in the other, as he thinks fit, and may decide any matter on his own knowledge, inspection, or calculation, and may state his determination or settlement in the form of a certificate in lieu of an award, which certificate shall have the same form and effect as an award in writing, and need not recite or set out any authority, submission, proceedings, or other formal matters.

"The generality of this article shall not be construed to be restrained by any particular provision of the Contract or Specification, and in case of any inconsistency between any such particular provision and this article, the provisions of this article shall prevail and have effect."

It would be superfluous to dwell upon the manifest unfairness of such a method of dealing with "disputes and differences." We simply protest against the continuance of a method that has been condemned by eminent judges of Appeal, and we earnestly hope that in the present instance a clause providing for the settlement of "Disputes and Differences" by an independent arbitrator will be substituted for the one quoted above. It is surely a case in which a word to the wise should be sufficient.

Notes and News.

Usher Hall Competition.

The Edinburgh Town Council is at last moving in the matter of the building of the Usher Hall, to be erected out of funds, amounting to over £100,000, bequeathed by the late Mr. Usher. The Council proposes to spend not more than £40,000 on the site and £70,000 on the building. Sir Aston Webb, R.A., is to adjudicate on plans for the latter to be obtained in open competition; and Mr. James A. Williamson, City Superintendent of Works, will be associated with him. The hall is to contain seating accommodation for 3,500 people.

* * *

The Education of Surveyors.

Mr. Julian C. Rogers in the course of his "Forty Years' Retrospect" at the Surveyors' Institution, made some trenchant remarks about public school education. It appears that there is an increasing number of sons of well to do and aristocratic people pressing into the ranks of surveyors, and Mr. Rogers, apparently, does not think much of them. "There were good candidates among them," he said, "but as a class they were markedly inferior in point of general knowledge and intelligence to the candidates who had had what were regarded as fewer educational advantages. They offered few or no signs that their powers of observation had been awakened or their interest aroused in things pertaining to the world of thought and action. As a rule they knew nothing about public affairs, about the institutions of their country or the practical machinery of life—knowledge that a young man of nineteen or twenty might be expected to possess. Their education, in short, seemed in far too large a number of cases to be lacking in precisely those features which were an important part of the equipment of a young surveyor. The reason for it was not far to seek. The public schools—especially the great day schools—inflicted on their pupils an immoderate amount of preparation for the next day's work, practically cutting them off in this way from the society of their elders, and, except in holiday times, from the life of the home. It was an evil system which eliminated a valuable element from the boy's life, and tended little or nothing to the education of his understanding."

Mr. Lever's Gifts.

At the meeting of the Liverpool Architectural Society on Monday week, the President (Mr. T. E. Eccles, F.R.I.B.A.) on taking his seat, moved the following resolution: "The Liverpool Architectural Society desire to express their appreciation of the help that Mr. W. H. Lever has again given to the art of architecture by his recent and noble gifts to the University of Liverpool, in providing the School of architecture with a home in the old Blue Coat Hospital, thus preserving a most interesting building to the city, and founding the Chair of Civic Design." He said the resolution needed neither a speech nor a seconder, and he would take it that the large number of members present gave it their unanimous approval. A copy of the resolution was ordered to be sent to Mr. Lever.

* * *

Builders support the Architects.

The architects of Warrington were asked to tender for proposed new elementary schools at Warrington under conditions which were very objectionable to them. The matter was considered by the R.I.B.A., whose members were recommended not to enter the competition. The Warrington Master Builders' Association considered the matter, decided to support the architects, and sent the following letter to the Town Clerk:—

20th January, 1910.

Proposed New Elementary Schools, Warrington.

Dear Sir,—It has been brought to the notice of this association that your Council have invited competitive plans from architects for the above schools, under conditions which are entirely new and detrimental to all those entering the competition, and which conditions have already been condemned by the Royal Institute of British Architects.

My association is satisfied that the conditions are of a very unfair and arbitrary nature, and under the circumstances request me to inform you that the members of this association will be recommended not to tender for the work, unless the unfair conditions are removed.—Yours faithfully,

BERTRAM B. MOSS,
Secretary.

The Town Clerk, Warrington.

The association have since heard that the letter has been ordered to lie on the table, and probably the job will be advertised. The Warrington Association will appreciate it very much if the builders throughout the country will support their action, and also the action of the Royal Institute of British Architects.

* * *

The Churchyard at St. James's, Piccadilly.

Very strong opposition has arisen to the bill promoted by the Westminster City Council to enable them to acquire the present Vestry Hall, and to build for the Rector and Churchwardens a new mission hall in place of it on a part of the churchward. Mr. J. F. L. Brunner, M.P., will move a resolution in the Commons this week, as follows:—"Having regard to the policy of Parliament as declared by the Disused Burial Grounds Act, 1884, and the Open Spaces Act, 1906, this House is not prepared to entertain a bill authorising the erection of buildings upon a disused burial-ground in contravention of such Acts." The Town Clerk has explained that the Council sought to erect a modern and sanitary mission-hall in place of the existing small and incommodious mission-room, and to compensate the rector and churchwardens to the extent of £2,000 for extinguishing their rights to make use of the Vestry Hall. The building, which it was proposed to erect would be about 73ft. by 43ft., and not more than 50ft. high, and would include, besides a mission-hall, classrooms and residential accommodation for the curate.

Army Buildings in 1910.

Mr. Haldane, in his speech on the Army Estimates last week, gave some particulars in Vote 10 of the building works to be undertaken during the current year. Some £94,000, out of a total of £270,000 will be spent on the improvement of married quarters in barracks. This work involves the abolition of single-room quarters, the enlargement of quarters generally and the addition of sanitary annexes; but the change must be done gradually owing to the rehousing of those whose quarters are absorbed. New barracks are to be built at Edinburgh and Redford on the cubicle system, and with various other modern improvements. The huts at Lichfield are to be replaced, and accommodation for a battalion is to be provided at Fort Burgoyne, Dover. The electric lighting installation at Aldershot is being extended; and an installation is to be provided at the Curragh. The Arbor Hill Hospital is being enlarged and improved; Chatham and York Hospitals are to be similarly dealt with next year. A new hospital will be begun at Tidworth, and officers' wards are being constructed at Millbank.

* * *

Architects' Benevolent Society.

The annual general meeting of the above society was held at 9, Conduit Street, on the 8th inst. In the annual report it was stated that two new members had enrolled—Mr. H. C. Corlette and Mr. Percy W. Lovell. £1,136 18s. 6d. had been disbursed in the relief of cases, including £270 paid to pensioners. The capital account had been increased by bequests amounting to £175. Donations totalling to £201 13s. had been made, and also some smaller sums. The society had thus been enabled to increase its investments by the purchase of £200 Queensland 3 per cent. inscribed stock at £171 16s., and £200 New Zealand 3 per cent. inscribed stock at £175 16s. The Council had decided to meet on the second Tuesdays in February, May, July, October, and December. An appeal was made for more practical support from the profession in order that the really necessitous cases might be adequately dealt with. Mr. Lacy W. Ridge, Mr. J. T. Christopher, Mr. J. Douglas Matthews, Mr. Wm. Dunn and Mr. Henry T. Hare were the retiring members of the Council, in whose places Sir Brumwell Thomas, Mr. Walter Cave, Mr. F. W. Hunt, Mr. Reginald St. A. Roumieu and Mr. Lewis Solomon were nominated for election. The President is Mr. Ernest George, A.R.A. (President R.I.B.A.); vice-presidents: Messrs. William Glover and Thomas M. Rickman. The Council for the ensuing year is as follows: Messrs. Benjamin Ingelow, Henry Lovegrove, Rowland Plumbe, William Woodward, the President of the Society of Architects, G. E. Bond, Arthur Ashbridge, Charles J. Blomfield, John Borrowman, C. R. Baker King, Sir Charles A. Nicholson, Bart., Sir Brumwell Thomas, Walter Cave, F. W. Hunt, Reginald St. A. Roumieu and Lewis Solomon. Mr. Nash was then re-elected hon. treasurer; Mr. Currey as hon. secretary, and Mr. Saxon Snell and Mr. C. H. Brodie as auditors, for the ensuing year. The meeting then terminated.

* * *

The Rome Boulevard.

The latest opponent of the Appian Boulevard is Signor Ugo Ojetti, a distinguished literary crtic, who contributes a fiery article on the *passeggiata archeologica*, which is being hurriedly carried out in defiance of expert opinion. Signor Ojetta declares that much of the picturesque region of the Via Appia within the city has been converted into a Saharan desert in order that Professor Baccelli may make his 200ft. wide road by next year, 1911, which is the year of the Italian Jubilee. The preparations for this celebration are in arrear, and it is for this reason that this part of the programme is being so hurriedly pushed forward. Commendatore Boni, the only archæologist on Commission of layman responsible for the project has resigned in protest; and Professor Lanciani has been appointed to the vacant seat. He is a sound archæologist, but, it is thought, will be powerless to influence the other members. In the Chamber of Deputies to-morrow, Thursday, a motion will be brought forward requesting the Government to remove the Zona Monumentale from the authority of the Commission to that of the Ministry of Education. It has the support of 25 deputies, but it is doubtful whether it can prevail against the bureaucracy.

THE NEW TOWN HALL, LANCASTER: THE COMMITTEE ROOMS. THE LATE E. W. MOUNTFORD, F.R.I.B.A., AND F. DARE CLAPHAM, F.R.I.B.A., ARCHITECTS.

These rooms, three in number, are placed on the east side of the building, overlooking the garden, and are divided by sliding doors. If necessary they may be used as one room, 80 ft. long by 20 ft. wide.

Patent Office Extension. Mr. Howard Chatfeild Clarke, F.R.I.B.A., concluded on the 9th inst. the arbitration case of Cohen's Trustees v. H.M. Commissioners of Works, which concerned a claim for compensation in respect of Nos. 13, 14, 15, 16, and 17, Furnival Street, and four houses in Tooks Court, Furnival Street, acquired for the extension of the Patent Office. The property has an agreed area of 7,797 square feet. Valuations were advanced on behalf of the claimants amounting to £29,160 on present buildings, and to £34,680 on new buildings for which plans had been prepared by Mr. L. Solomon. On behalf of H.M. Commissioners a valuation of £19,919 was put forward. The award was reserved.

* * *

Richmond Castle. Mr. Lewis Harcourt's statement in introducing the Ancient Monuments Protection Bill to the Commons has raised considerable speculation as to the identity of the monument which he stated had been presented to the Nation. The general belief is that Richmond Castle is the building referred to; but as announcement of the arrangement between the Duke of Richmond and Gordon and the Office of Works had been announced prior to Mr. Harcourt's statement the matter is not quite clear. Richmond Castle stands on the summit of a rock, overlooking the town of Richmond and the River Swale. A kinsman of William I. is supposed to have founded the town and the Castle, and the latter was probably, for a long time after erection, unrivalled in extent and strength. The principal portion of the building now remaining is an immense square tower on the north side, said to have been built about the middle of the twelfth century. At the south-east corner of the castle is the ruin of a smaller tower, in the bottom of which is a dungeon about 14ft. deep; there is also another tower at the south-west corner, round and narrow, and of considerable height, to which there is no entrance except from the top. A part of the ruins passes as the banqueting hall of the castle, and, though roofless, affords a very good idea of what such an apartment was. It measures 72ft. by 27ft., and its most striking feature is the corbelling, which is almost intact.

* * *

The New Mall. The utilitarian reasons which have contributed to spoil Sir Aston Webb's design for the new entrance from Charing Cross to the Mall are the subject of an illustrated note by Mr. P. G. Konody in the "Daily Mail" of the 10th inst. Mr. Konody declares that the whole scheme breathes the spirit of compromise. But special emphasis is drawn to the fact that unless the approach is opened up from the Charing Cross side the whole thing will be ruined. "Unless Drummond's Bank and the houses opposite are pulled down the whole site, on which so much money has already been expended, will remain an eyesore and an anomaly, and will have to be added to the long list of lost opportunities which unfortunately form so extensive a chapter in the architectural development of modern London."

* * *

The A.A. Play. On this page we give a reproduction of the poster advertising the A.A. play. It was designed by Mr. Harold J. Simkin, of Liverpool, and gained the prize offered by the committee. The A.A. players after a series of productions in the "fit-ups" and halls have at last arrived at the legitimate stage, to wit, the Court Theatre, Sloane Square. This will, we doubt not, save them much trouble with their staging; but the "smoker" cannot obviously take place in a theatre under the Lord Chamberlain's licence. We hope to see the house crowded at both performances, and we trust that the leaders of the profession, to a man, will be found among the audiences. Those who have been in former years (by their own confession) enjoyed themselves immensely. Very complete arrangements have been made for the sale of tickets. As to the play we believe it is not altogether new; but the title, "Arctia," suggests something to do with polar exploration, which is very much in the air just now. We have, however, no inside information on the subject. The man who asked who was "ap—peary—ing" in the play is not very well just now.

* * *

The Late Sir Thomas Drew. We regret to announce that Sir Thomas Drew, R.H.A., F.R.I.B.A., died in Dublin on Sunday last. Sir Thomas who was the leader of the Architectural profession in Ireland, was born in Belfast in 1838, and was articled to the late Sir Charles Lanyon. He was consulting architect to Christ Church, and St. Patrick's Cathedral, Dublin, and to Armagh Cathedral. He was a past-president of the Royal Institute of Architects of Ireland, and also of the Society of Antiquaries (Ireland).

THE NEW LANCASTER TOWN HALL.

The new Town Hall, Lancaster, which occupies the south side of Dalton Square, is rectangular on plan, and was designed by the late E. W. Mountford, F.R.I.B.A., and his partner, F. Dare Clapham, F.R.I.B.A. This building forms with the Ashton Memorial, which was designed by John Belcher, A.R.A., a munificent gift from Lord Ashton to the county town. The main façade to Dalton Square is 132ft. long, with a pediment in the centre supported on six Ionic columns 32ft. high. The pediment contains sculpture by F. W. Pomeroy, A.R.A., representing His Majesty King Edward VII. in coronation robes holding the orb and sceptre, with female figures on either side, representing Truth and Justice and Freedom and Loyalty respectively. The height of the building from the pavement to the top of the balustrade is 55ft., and the clock tower, which is placed over the main staircase, is 146ft. high and 31ft. square at its base. The clock has four dials 10ft. in diameter. The hours are struck on a three-ton bell, and four smaller bells strike the "Westminster" quarters. The elevations throughout have been executed in Darley Dale stone. The hall, which is 38ft. high, is surmounted by a domed ceiling. The council chamber is 40ft. long by 30ft wide, with semi-circular recesses at each end. It is panelled in oak to the height of 12ft. 6ins., from which spring four arches carrying a vaulted ceiling with a domed light in the centre. The whole of the fittings are in oak upholstered in Morocco leather. The reception rooms, consisting of banqueting hall, reception room, and Mayor's parlour, occupy the entire front of the building on the first floor. The committee rooms, which are three in number, are placed on the east side of the building overlooking the garden. It is possible to convert them into one large room measuring 80ft. by 20ft. The public hall, which is situated on the first floor, is 100ft. long by 61ft. wide, with a platform 45ft. wide by 20ft. deep, and contains at the back a large concert organ. The police court is 30ft. by 30ft. and is placed in the centre of the building on the ground floor. The consulting engineers for the buildings were Reade, Jackson and Parry; the surveyor was E. C. Pinks; and the clerk of the works was Michael Hague. Waring and Gillow of Lancaster were the general contractors, and the following were some of the sub-contractors:—Gilbert Seale and Son, London, external stone carving; Waring and Gillow, Lancaster, woodcarving and furniture; Rosser and Russell, London, and Seward and Co., Lancaster, heating and ventilating; Verity and Co., Manchester, electroliers; Bromsgrove Guild, Worcestershire, fibrous plasterwork; Crittall Manufacturing Co., London, casements; Waygood and Co., London, lifts; Doulton and Co., London, sanitary fittings.

Elevation from the North-East.

THE NEW TOWN HALL, LANCASTER. THE LATE E. W. MOUNTFORD, F.R.I.B.A., AND F. DARE CLAPHAM, F.R.I.B.A., ARCHITECTS.

ELEMENTARY SCHOOL DESIGN.

SOME EXPERIENCES WITH DERBYSHIRE ELEMENTARY SCHOOLS.

By G. H. WIDDOWS, A.R.I.B.A.

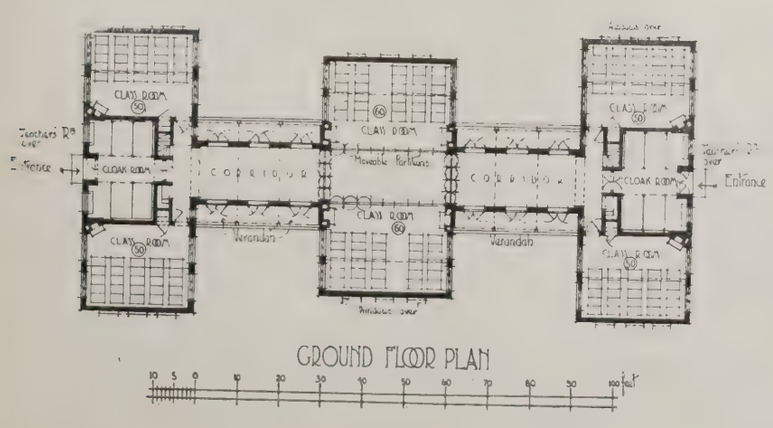
(*Architect to the Derbyshire Education Committee.*)

[*These notes have been abstracted from a paper read by Mr. Widdows at a Provincial meeting, held at Derby recently, of the Royal Sanitary Institute. The main points for which Mr. Widdows contends are cross-lighting and cross-ventilation, and to these he reverts again and again in the course of his paper. Other important points are the sizes and number of the class-rooms; the delinquencies of the Board of Education; and the relations between Architects and Doctors as regards opinions on hygiene.*]

Size of Schools and Classrooms.

In a measure, guided by Mr. Grindrod, H.M.I., the Derbyshire Committee adopts the principle of six classrooms in a school with from 250 to 350 children, each under a head teacher.

It has been found that of infants below seven the boys and girls are nearly equal in number. In large areas, therefore, three blocks of schools have been erected for the three divisions.



Sizes of classrooms are as follows:—two for 60 each and four for 50 in each block. This is on the large size. If the present allowance of 10 square feet per child is increased to the higher elementary basis of 12 square feet, as it may be, or when the number in the classes is reduced, these rooms will accommodate 50 and 40 respectively. A six-room school allows the three infant classes to be duplicated; in the case of older children each standard has a room to itself, standards VI. and VII., owing to the smallness of their numbers, being almost always taken together.

Two other points: the tendency is to exclude children under five, and to encourage children to stay until they reach the age of sixteen. If the school age be raised, and if Standard I. be taught in the infant school, the six-room arrangement still holds good, for there will be sufficient students for Standards VI. and VII. to be taught separately. If a 60-room be made sufficiently large, and assuming that uncertificated teachers will, in the future, count for not more than 30, in lieu of 35 at present, two classes or two divisions of a class can be taught in one room: the head teacher will be better able to rearrange his staff to meet a temporary difficulty of illness.

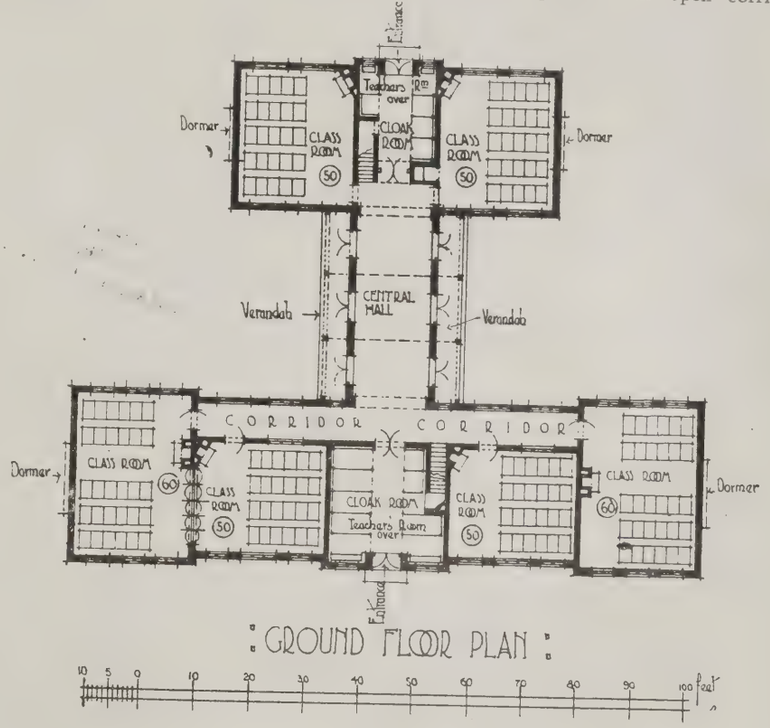
Plans.

No. 1 is my first attempt at cross-lighting and cross-ventilation, and I like this plan as well as any. It will be seen that the central part of the building can, by the use of screens, be turned into what is practically a central hall. In the case of infants the central part and two corridors form playing places in wet weather; it is a help to teachers to be able to have children divided into three groups at such time instead of all together in a central hall. Corridors are 13ft. wide; enable two boys side by side to perform extended drill without touching each other or the walls. Corridors provided on each side with double doors opening into verandahs, no rain enters, and drill takes place practically in open air. Verandahs avoid expense of covered shelters.

No. 2 shows that cross-lighting and cross-ventilation do not involve one type of plan. This gives a central corridor on the small side. In another school of this type I am doubling the corridor length and making it 20ft. wide. The whole school can be assembled in it for prayers.

Plan No. 1.

Nos. 3 and 4 were prepared to enable three rooms to be built at first, with extension later when required. No. 4 is not so good for cross ventilation, taking each room by itself; but if the screens are thrown back the building is easily air flushed. Provides a good area for village meetings.



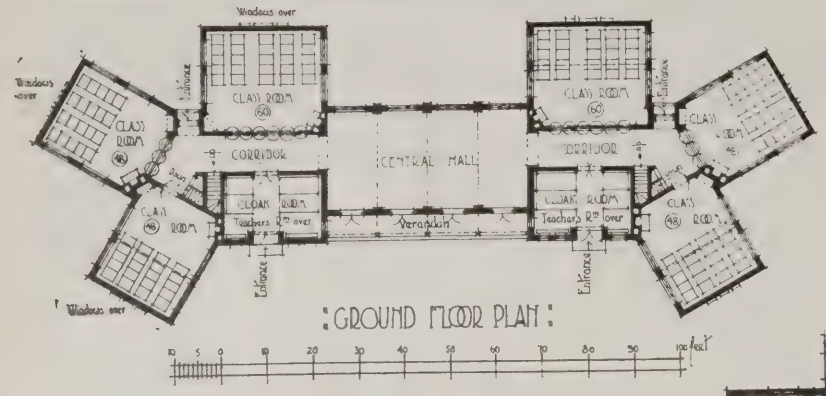
Classrooms.

These are 11ft. in height to wall-plate and 14ft. to the ceiling. Strain on teacher's voice if of greater height. Height has direct bearing on ventilation (q.v.). Sunshine in each room desirable; in a cross-lighted building the placing on the site is less material, as sun is sure to reach each room some time during the day. The walls and ceilings are plastered. In infant school a height of 4ft. from the floor, and for older children, 5ft. 6ins., is made of hard plaster coated with green composition, for free arm drawing. This is cheaper than glazed bricks, and serves double purpose.

Teachers' Rooms, Etc.

Two in each school; one for the head and the other for assistants. Also a large store for school goods.

We are far from claiming that finality has been reached. In summer the air below the window-sill level, in which children sit and breathe, gets heavy. Plans 5 and 6 show a further development with open corridors,



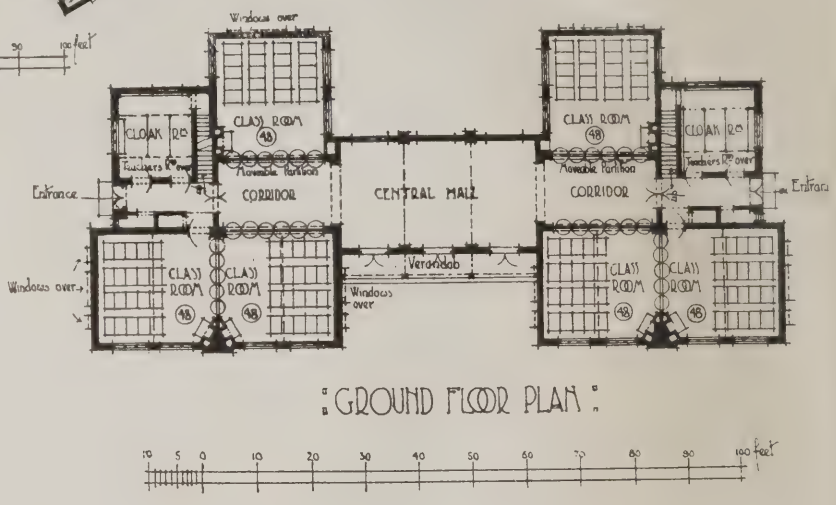
Plan No. 2.

each room opening direct into the fresh air. Cross-ventilation to the cloak-rooms—a desirable matter—is also provided. The open corridors are 8ft. high, with concrete and asphalt roofs; classrooms have windows below the flat and dormers above, so that cross-ventilation will be fully maintained. There is a step down from corridor to classrooms, and to prevent draught coming under door in winter, doors close against step and not on top of it.

Windows, Ventilation, and Heating.

Swing lights in end gables of classrooms, 9ft. 6ins. from the floor, so that light does not fall direct into the teacher's eyes. Side windows are provided with hoppers at the bottom and swing lights above, the hoppers being air inlets, and the swing lights outlets. Hoppers open not more than four inches, formed with a deep rebate at the top, compelling the incoming air to travel upwards. If hoppers open more than four inches the air

Plan No. 3.



comes in horizontally, catching the teacher's head. It is surprising how little this point is understood. See No. 7, section of hopper in use in Derbyshire schools, also iron "Derby" hopper for use between stone mullions. To this latter a wind shield is attached to compel air to travel upward. The net glass area is one-fifth of floor area in each room.

Ventilation is further assisted (particularly in inclement weather) by the fireplaces in each room, provided with two 14 by 9-in. air-flues, one on each side of the fireplace. These air-flues are continued down to floor level, as there is more vitiated air below the level of window sill than above; the flues have regulating grates at floor and ceiling level.

Heating is by low-pressure hot water, with ventilating radiators in each room. No room has less than 14 sq. ft. of heating surface per 1,000 cub. ft. of contents, and if rooms are at the end of a circuit they have 18 sq. ft. Ventilating radiators are reckoned at half catalogue efficiency to compensate for extra quick circulation of air brought in and warmed by them. What is aimed at is not a large body of dead air, but a smaller body changed frequently. As *each* child should have 1,500 cub. ft. of air per hour, it will be seen how necessary it is to change the air frequently; and how little help is an extra 2 or 3ft. in the height.

Floors.

Usually of maple nailed to coke-breeze concrete, or are of wood blocks on concrete.

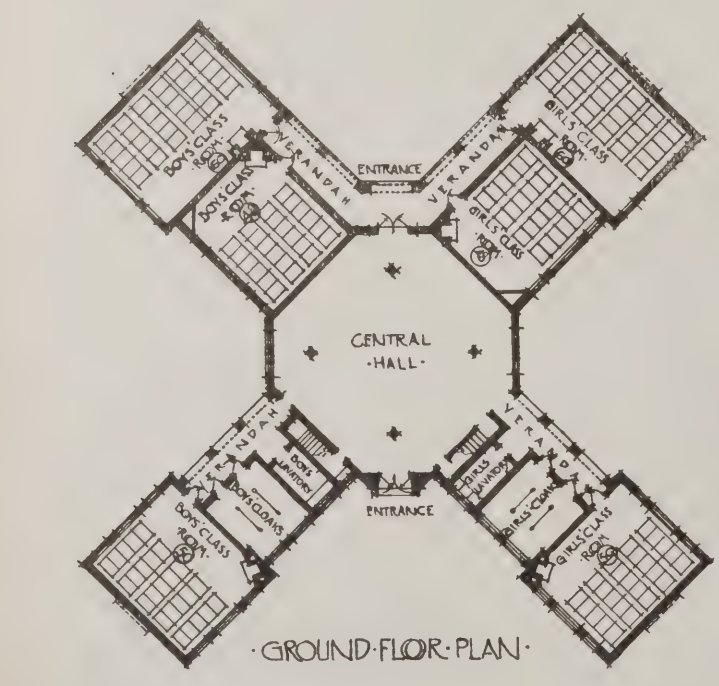
Plan No. 4.

I have tried two small jointless mastic floors; neither has proved a success. I have also tried asphalt, but it is cold to the feet. A suitable jointless floor, both warm and durable, would bring a fortune to its inventor.

Painting.

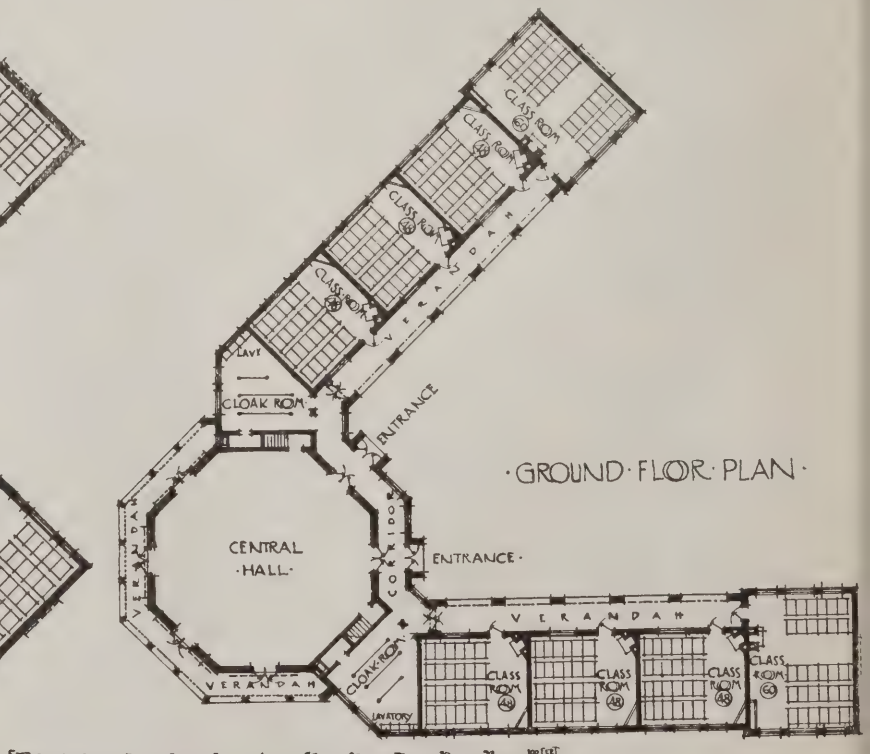
Rely on green and white externally. Internally the woodwork is usually a light green, and walls, above dark green dado, are tinted a light warm buff. Picture rails are kept 2ft. or more below the wall-plate, and the white of the ceiling is brought down to them. Colours should be light and bright, but not glaring or gaudy. At an old school, where I changed a dismal terra cotta, that had for eight years held sway, the headmaster volunteered the information that both teachers and pupils had benefited by the change and did their work better.

Artificial Lighting.



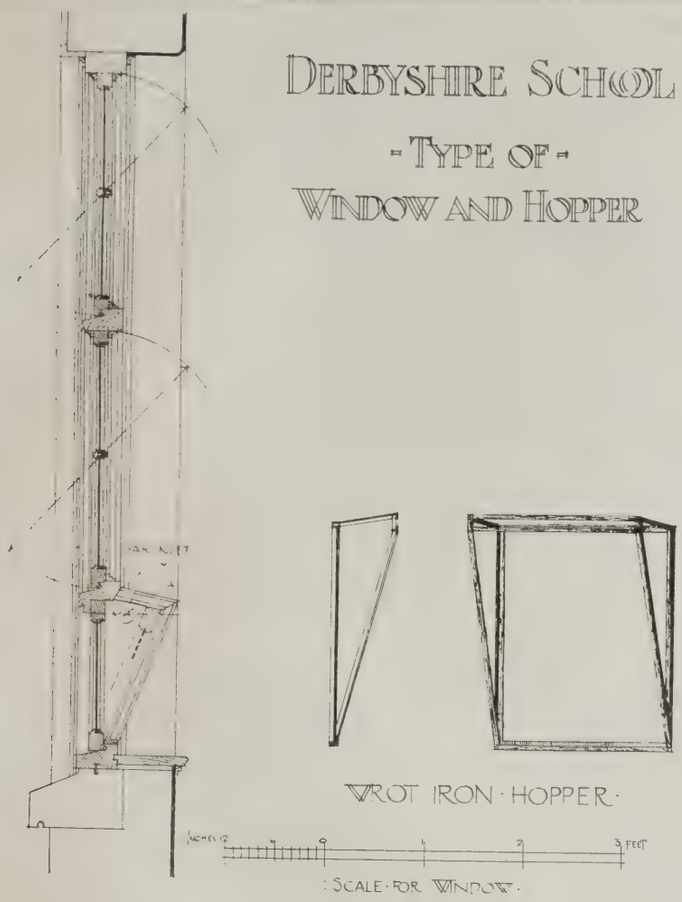
Electric light is used wherever available, but in most cases only gas is obtainable. With gas we used single inverted incandescent lights arranged to spread the light equally, the bottom of the globes being 8ft. 3ins. from the floor. To obtain satisfactory lighting the ratio of candle-power to square feet of floor area should not be less than 3 to 5.

Fixtures.



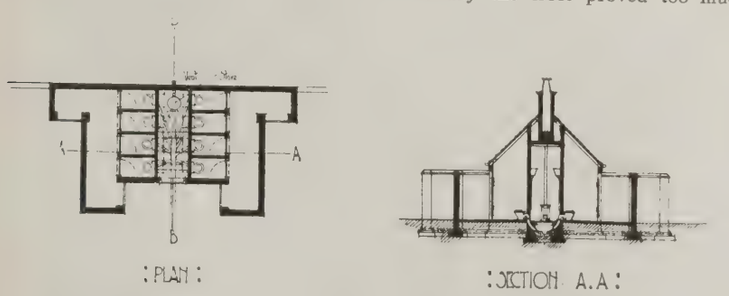
Cupboards are worked, where possible, as part of the structure, cumbersome pieces of furniture being thereby avoided.

Sanitary Work.

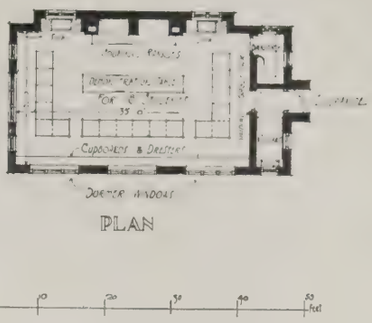


The out-offices are one of the school architect's greatest difficulties. We are abolishing the privy midden, providing pail closets in country districts. The difficulty with the girls' accommodation is got over by fitting as urinals a certain number (according to the size of the schools) of closets. These are fitted with hopper pans and connected with the other drains. The doors of these closets have a large "1" painted on them; the pail

Plan No. 5.



Plan No. 6.

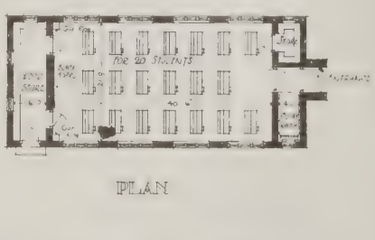


Plan No. 7.

closets have "2" marked on the doors. I was sceptical about this experiment, but it has been successful. The children seldom or ever misuse the closets, and so one difficulty in country districts is obviated. Where a water-carriage sewerage system exists, we invariably use it, but have had considerable trouble and expense in winter, through careless or ignorant caretakers, frozen pipes and cisterns, etc. Where closets exist, matters are improving owing to better attention on the part of both teachers and children.

We have adopted the gravitation system of feeding for closets. This means that all the water enters through one cistern, and all the other cisterns are fed through the bottom from it. There is thus only one ball-cock in lieu of several, and the gravitation feed-pipe being provided with a further length of pipe and draw-off cock, every cistern and pipe can be emptied in frosty weather. Even then we found that when the water was turned on for a few hours in the middle of the day the frost proved too much. We

Plan No. 8.



Plan No. 9.

now arrange the closets as shown on the drawing No. 8. A four-feet gangway is placed between the closets; the cisterns are placed therein, and the traps of the pans are made to extend quite through the wall. The gangway is kept heated by means of a slow combustion stove or hot water-pipes, and we hope now we have arrived at something that will defy frost.

For boys' urinals a plain wall, covered with cement, and coated with a mixture of pitch and tar, appears to be as cheap as anything and as efficient. Perhaps ere long we shall be able to teach children to use closet pans as urinals. The water bill would be increased, but the gain would be great, and it would teach children still more to use closets aright in their own homes.

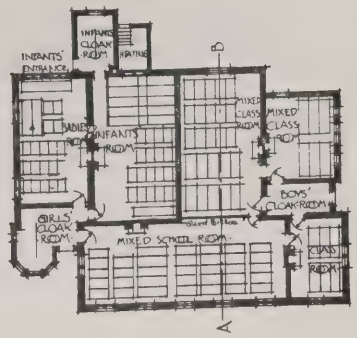
Cookery Rooms.

Plan No. 9 shows the kind of cookery rooms we are erecting. Instead of placing the ranges at the end of the room, we place them upon one of the long side walls. The students can see better what is going on, and the same ranges answer for demonstration and practical work. Two sinks with hot water are provided in full view of the scholars, so that washing up may also be made a matter of instruction. At one end a

Plan No. 10.

larder is provided, and a small cloakroom for classes coming from a distance. The only furniture other than tables and desks are two shelves for saucepans, a rack for pastry boards (with complete circulation of air), and dresser. The tables are of the ordinary kitchen type. By providing four sinks instead of two and by providing two coppers, laundry work can also be taught.

Manual Instruction Rooms.



Plan No. 10 shows a manual instruction room for 20 students. At one end benches are set apart for metal work.

Cost.

Cross-lighting and cross-ventilation add little if anything to the cost. Our schools have varied from £9 9s. to £13 13s., and one may say that under ordinary conditions a six-room school costs £11 11s. per head. This includes boundary walls, playgrounds, out-offices, and main building, but does not include site and furniture, nor does it include special buildings, such as cookery and manual centres.

Alterations to Existing Schools.

These are our most troublesome problems. The oldest schools, L or T shaped, are easily ventilated, but one becomes nearly desperate

:PROPOSED ALTERATIONS:

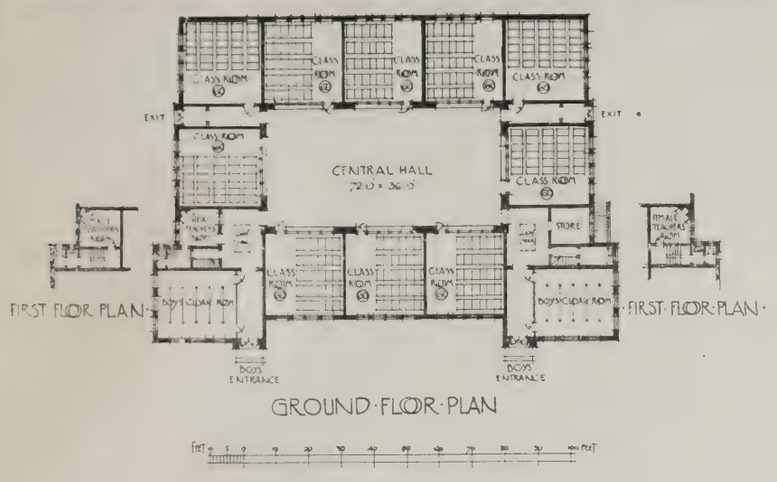
Plan No. 12, Alterations.



when confronted with plans supervised by the Board of Education after the Act of 1870. Look at plan No. 11. We have had to cut the roofs away, drive a low corridor through the building, with a door at each end, and obtain cross-ventilation to the classrooms by means of windows above the corridor. Now look at the next plan, No. 12, as it exists to-day. Could anything be worse? It is next to impossible to make a really successful alteration, but you will see we are doing our best to get a conduit to carry fresh air into the middle of the building, and are also providing thereby that each class can pass out without disturbing half the school.

One could forgive the Board their past delinquencies if there were signs of repentance in the present. But how can one respect a public authority which still continues to pass plans such as plan No. 13, a plan that is being used wholesale in the West Riding? Here we have the central hall surrounded on all four sides. How is it possible to ventilate satisfactorily a building of this kind? Think, too, of the depressing effect of these halls with no window for anyone to look out. Then, again, look at the accommodation—ten rooms of sixty each. Six hundred children under one head teacher, and all classes the same size!

Before leaving the question of alterations, let me draw attention to an interesting scheme at West Hallam. Here was a voluntary school with a substantial endowment. The governors of the trust allowed me to act as their architect in what we all hope will be the beginning of better education in rural districts. The old school was remodelled, the master's house was converted into a science laboratory, and a stable near was converted into a manual centre. At the girls' school the mistress's house was converted into a cookery centre. The school is now no longer of the ordinary village type. It serves several villages adjoining, and to it promising scholars are admitted free. A plan is given, No. 14, showing the school as it now exists.

Some Observations.

"For my part, I would rather see the Board (of Education) leading the way and providing us provincial architects with good ideas; instead, we have a Board which not only does not lead the way, but hinders those who are trying to get out of the rut. Some say the Board will find out that light and air are two of Heaven's greatest blessings."

Plan No. 13.

"It is a disgrace to our civilisation that such rooms (bath-rooms for cleaning dirty children, under the Medical Inspection Act) should even be thought necessary. I am reluctantly driven to the opinion that the only thing at the present time to improve the general cleanliness of the people is compulsory military training. Men trained and accustomed to military cleanliness would cease to tolerate the filth and squalor of slums."

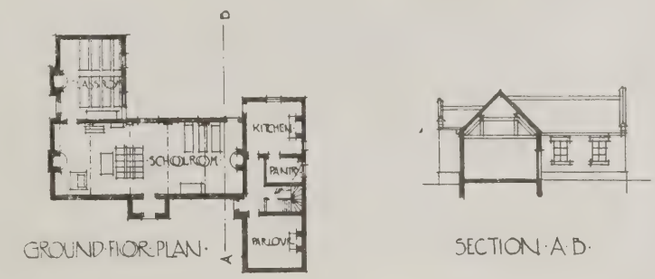
"As a finish to a girl's school career the provision of 'home-making' centres is under consideration. In this case I shall probably not be called upon to design anything, as it is more than probable that existing artisan dwellings will be hired. This will give a thoroughly practical turn to their education, and must prove of greater service to the girls than being taught in a special building unlike the homes they inhabit."

"I am hopeful that metal-work (in manual instruction) will form a greater part of our rural education as time goes on. Why should not our village smiths turn their attention to other things besides horseshoes and cart wheels? Why should the squire, when he wants a lamp, write to a London store? Why should not the smith, as of old, be able to design and execute? The smith would take a pride in it, and the squire would get more enjoyment, knowing he had encouraged local talent."

"As the Medical Inspection Act refers to elementary schools only, it is to be feared that secondary schools are not receiving the attention that is their due. Secondary buildings require just as much revolutionising as elementary. All one can say is there are not so many children in each class, and their clothes do not stink. The fact remains, however, that they require the same amount of air as other children, and they have the same difficulty in obtaining it. In the secondary schools of Derbyshire (aided or maintained by the county committee) 70 per cent. of the children come from elementary schools, and more than 25 per cent. of the total are free places. Why should inspection be necessary for these children while they are in elementary schools but no longer necessary when they get to a secondary establishment? It is difficult to get an Englishman to be logical."

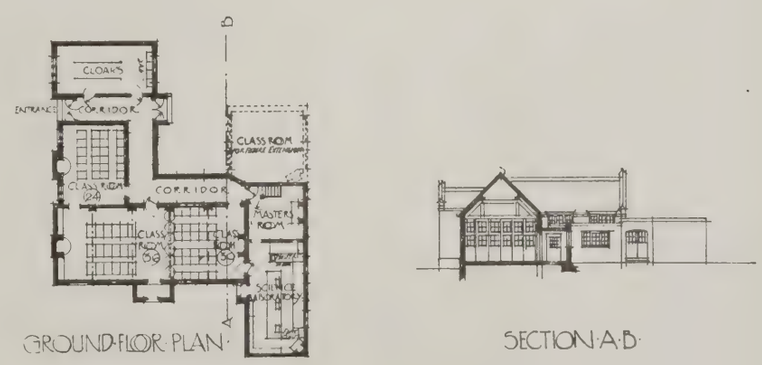
"The tendency among architects is to regard doctors as cranks and faddists. Unfortunately, some are, but certainly not all. Architects will do themselves no good by ignoring the doctors. There are very few architects who understand ventilation, or who take the trouble to try to understand it. They swallow some firm's patent nostrums, and that is as far as they go. The doctors have come to stay, and architects must rise to the occasion so as to be able to debate the questions with the doctors. For my part, I hope the Royal Institute of British Architects will go more into it, and make their examinations more drastic in the matter of ventilation, lighting, and heating."

Discussion.



The Bradford City Architect. Mr. R. G. Kirby, A.R.I.B.A., having congratulated the Derbyshire County Council upon having such an architect as Mr. Widdows, said there was no doubt newer and better types of schools were being evolved to suit particular districts, but it was much to be regretted that perhaps 70 or 80 per cent. of the schools being erected in the country to-day were totally unsuitable for present educational requirements. He had lately seen many schools in Birmingham, Staffordshire, and Derbyshire, and there could be no doubt that Mr. Widdows had been successful in obtaining good light and efficient ventilation in every class room. A recent visit to Germany had impressed on his mind the importance of the great marching halls they had in the schools there, and especially in view of the inevitable adoption of some form of conscription. Whilst so favourably impressed with Mr. Widdows's schools, he yet thought that the Bradford schools being erected now were more suitable for that town, because the conditions were different from Staffordshire and Derbyshire, where they had flat sites and unexposed positions. In Bradford they had a detached hall with classrooms in one row, all facing south, with a fresh air corridor opening into the class-rooms. As a further development of the open air schools, he was trying a school with verandahs facing south, so that in summer time the side of the class-rooms might be thrown open, and the children would be practically in the open air. He was greatly pleased with the adaptability of Mr. Widdows's schools, their artistic appearance, and the absence of barrack-like appearance.

* * *



The Derbyshire M.O.H. Dr. Barwise urged that they had not yet gone far enough with regard to school planning, and he could not allow deep breathing to take place in any school where the air came in contact with the class-rooms.

* * *

The Staffordshire M.O.H. Dr. Reid described what are now known as the Staffordshire type of pavilion schools, and urged that the only way to plan a school was to treat it practically as a hospital. He would like to have it established as a principle that they must have cross ventilation, and he would like to go further and pass no class-room which opened into a corridor. It was often said that pavilion schools occupied a good deal of space,

EXISTING SCHOOL.

PROPOSED ALTERATIONS.

Plan No. 14.

and were costly to build, but this was not so, and there was no reason why such a school with two or three storeys should not be erected, each storey having a verandah. In fact, the University at Bangor was being erected on this plan. They had no open fireplaces in the Staffordshire schools; they gave 40 inches of ventilation per child, and allowed 26 to 28 feet of heating space per 1,000 cubic feet.

* * *

A Schoolmaster. Mr. Clegg, of Long Eaton, as a schoolmaster who had worked in the older type of school, and the new type designed by Mr. Widdows, said that his staff had had no trouble with teachers' sore throat since working in Mr. Widdows's schools, and he thought that was perhaps one of the greatest tributes which could be paid to a school architect.

* * *

The Mayor of Derby. The Mayor of Derby thought it was a case of the survival of the fittest type of schools, but in the meantime the ratepayers had to pay for the cost of the struggle.

* * *

One of H.M.I. Mr. Owen thought the complaints against the Board of Education had been exaggerated. He admired Mr. Widdows's schools, but there were other schools which no one could say should be abolished. It had to be remembered that architects had been erecting schools for many years, and apparently the only two people who had solved the problem were Dr. Reid and the author.

* * *

The Sheffield City Architect. Mr. Edwards remarked that in the past the planning of schools had been looked upon primarily from the point of view of teaching, and now there was a tendency to go to the other extreme, and possibly they might be making a mistake in treating schools too much like sanatoria. A great many mistakes in school planning were also due to the competition system, because an architect knew he would have no chance of winning a competition unless he followed on the lines of the usual plans.

* * *

The Chairman. Mr. H. D. Searles-Wood, F.R.I.B.A., said that he was old enough to recollect the introduction of the central hall by Mr. Robson, of the London School Board, and it was adopted entirely from the supervision point of view. He hoped there would not be another society of architects, and would suggest that the Royal Sanitary Institute could always afford facilities for official architects to confer together.

* * *

The Lecturer Replies. Mr. Widdows said he could not agree with Dr. Reid that it was necessary to have so large a heating area. In the Staffordshire schools, if the teacher closed the windows there was no ventilation at all, whereas with the open fireplaces the foul air always had a chance to escape.

The City Iron Co. announce that in consequence of Messrs. W. Graham and Sons, of 35, Upper Thames Street, having decided to retire from business, convenient showrooms and stores have been secured at 47, Upper Thames Street, where the first-named firm will trade as the City Iron Company. They have Messrs. W. Graham and Sons' permission to continue the sale of their patterns, and are therefore in a position to supply any goods shown in their catalogues and price lists, including renewal parts for ranges, etc. Their showrooms will also contain a number of entirely new designs in wood mantels, stoves, ranges, baths, etc., including the "Presto" automatic flushing closet, for which they have the sole agency.

THE FIRE PROTECTION OF FACTORIES.

The enormous aggregate of fire waste in the United States, which so greatly exceeds that of other civilised countries, is becoming a serious tax on the commercial resources of that country, and it is gradually coming home to the American public that fire insurance companies are not fairy godmothers, evolving means for compensation by some subtle magic, but that they are merely collectors and distributors of a fire tax wrung from the public itself. Out of this tax they pay losses, the cost of conducting their business, and a reasonable interest on the capital laid down. Part of this tax is levied directly on the average man, in the shape of his fire insurance premium; but he is also taxed indirectly inasmuch as everything he eats, wears, or uses, is affected in cost by the amount of fire tax which the various manufacturers or retailers of these commodities have to disburse. Consequently if the aggregate amount of fire waste in any country is great, it is mathematically certain that the community in general is paying much more for its fire protection than it ought to do.

The Protection of Fire-waste.

Few manufacturers are now under any delusion in the matter of fire protection. They realise that the amount of the premium or fire tax they pay bears a direct relation to the character and fire hazard of the buildings they occupy; and that they also pay for the carelessness or negligence of their neighbours. Moreover a destructive fire, even if, in the popular phrase, "covered by insurance," may cause a serious dislocation of business, and probably the loss of many customers; and this unwelcome denouement cannot be estimated for insurance premises.

The question of fire-protection is first and foremost concerned with the construction of buildings, i.e., with the character of the materials used, and the manner in which they are put together. There is another side to the construction of buildings which has called into being the fire protection expert; and that relates particularly to the design and arrangement of the structures, and to special risks involved in particular industries. It is not sufficient that a structure should be built of incombustible material, for a fire may yet spread from floor to floor, and department to department until the entire contents are burnt out. Further, if a certain part of any manufacturing process involves greater fire hazard than the rest, obviously it will be wisdom to consider carefully the particular location of that process in the building; and possibly to relegate it to a separate structure altogether. Failure to consider these and similar points may involve the owner in heavy premiums to cover risks that could easily have been avoided.

The Principles of Fire Prevention.

Three main points in the fire protection of a factory have been put forward recently by Mr. F. H. Wentworth, secretary to the National (American) Fire Protection Association. These are given as follows:—

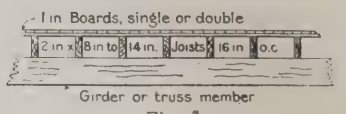
(1) There should be as little combustible material as possible used in its construction and equipment.

(2) Each floor should be absolutely cut off from every other floor, and each section from every other section, so that fire may not communicate.

(3) Every part of a factory should be equipped with extinguishing apparatus.

The first point is one to which particular attention has been paid in Great Britain. In fact, fire protection here has been mainly confined to the application and testing of fire-resisting materials, to the exclusion of the important questions involved in the second item, and, in a lesser degree, that in the third one.

The second point is of considerable importance when one remembers how many mills and factories in this country are let out in separate floors, with consequent risks inseparable from divided control and varying processes in the same building. But both the first and second points interact upon one another, as will be explained.



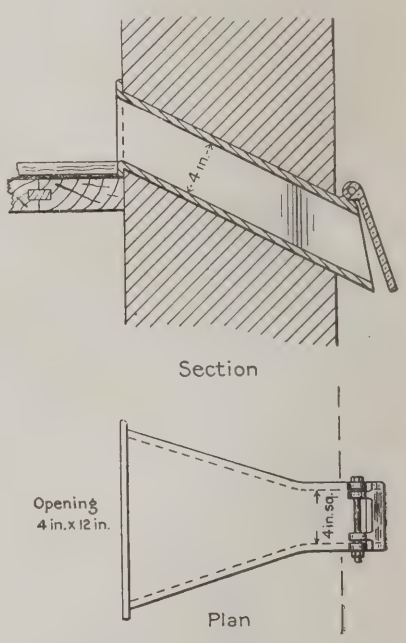


Fig. 1.

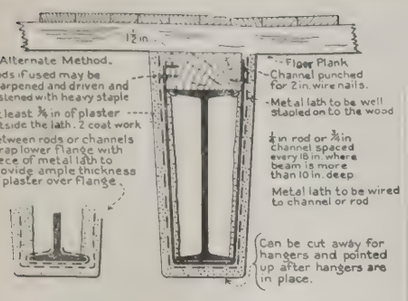
UNDESIRABLE CONSTRUCTION.

Fig. 1. Note the large expanse of wooden surfaces exposed to fire and the fact that a slight fire which may burn no more than half an inch from each side of the joists practically destroys their strength, whereas a similar fire burning under purlins or timbers illustrated in Figs. 2 and 3 may do but little injury to them.



An incombustible building is not an impossible thing, in the sense that materials may be employed which will not ignite; though the destruction or disintegration of any building material is merely a question of degrees of heat. But if the building is sub-divided by fire-resisting walls and partitions, and the openings between them closed by fire-resisting doors an outbreak of fire can be so limited in extent that the degree of heat engendered will rarely be great enough to seriously endanger the structure. Still, the mere confinement of the outbreak to the section in which it commenced does not complete the work, for means of extinguishing the fire in the isolated section should be provided. It is thus evident that all three points put forward by Mr. Wentworth are independent and complementary for the purpose of modern fire protection.

DETAIL OF SCUPPERS.

Non-Combustible Construction.

This brings us to the question of non-combustible construction. Here reinforced concrete presents obvious advantages, and with such construction every floor may, by avoidance of vertical openings through it, be made practically a fire wall. It is, of course, essential that in all factories of whatever type of construction stairs, elevators and belts be placed on fireproof enclosures with openings to each floor; protected by fire doors or shutters. If in addition to the omission of all vertical openings, provision be made to drain the floors through scuppers set into the outside walls, the possibility of water damage to goods or materials on floors below is much lessened.

SUGGESTION FOR FIREPROOFING STEEL BEAMS.

Slow Burning Mill Construction.

An objection to reinforced concrete factory construction comes from some manufacturers, because it does not present convenient surfaces for the attachment of pulleys, shafting, and machinery. They prefer "slow-burning" mill construction, which has its own inherent problems. Here we have wooden floors, enough wood must be used to insure strength and stability, but superfluous wood should be avoided. It matters very much just how the quantity of timber is disposed, and the guiding principal should be to present the least possible amount of wood surface to the fire attack.

For example, a mill planned with heavy beams, eight to eleven feet on centres of continuous spans from wall to post, or post to post, is infinitely more desirable than one of miscalled mill-construction having longitudinal girders resting upon posts on which the girders are placed four feet or less on centres. The latter construction not only adds to the exposed wood surfaces which may be attacked by fire, but the disposal of the timbers obstructs the action of the sprinklers, and prevents the sweeping of hose streams from one side of the mill to the other.

Those undesirable fire-boxes known as light-joisted buildings should never be permitted for factory use; they should be forbidden by the by-laws. Light joists or rafters two or three inches in width, spaced from ten to sixteen inches on centres, ignite and burn like kindling. Their numerous corners furnish projections for easy ignition. The menace of such construction is generally aggravated by sheathing under the joists. This provides a series of wooden cells and concealed spaces in which fire may riot and lodge, and dodge extinguishment until the floor or roof is burned through. By the same token partitions of light wood should be avoided.

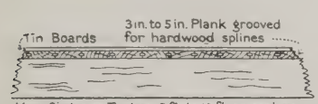


Fig. 2.

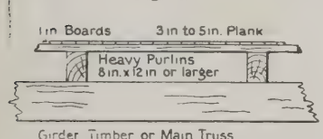

Fig. 3.

GOOD TYPES OF CONSTRUCTION.

Fig. 2 illustrates plank directly on timbers or girders not usually over 10 feet on centre.

Fig. 3 is a type where trusses, posts, or girders are widely spaced, necessitating use of purlins to support planks.

Note that an 8 × 12-inch purlin has an equivalent amount of wood to six 2 × 8-inch joists spaced as Fig. 1, and that the latter expose 108 square ches of surface to a fire as compared with 32 uare inches in the former.

Fire Protection of Steel.

Timber posts offer greater resistance to fire than wrought iron, steel, or cast iron pillars if the latter are unprotected. As steel or wrought iron, when heated, will fail by buckling or bending before an equivalent beam or post of wood will be dangerously affected, it is of importance that steel members essential to the stability of the structure be fireproofed; otherwise a fire in a lower storey may bring down in wreck everything above it. Where steel beams support wooden floors they must be fireproofed if they are to resist fire as well as the floors. The accompanying cut gives in detail an inexpensive method of protecting steel beams, and this is also applicable to wrought iron or steel stanchions. A more substantial method is usually advisable for the latter, however, and protection against mechanical injury near the floor should be provided. Concrete casing is frequently employed for the purpose.

Photo: Topical.

CONCRETE HOUSE AT WINTHROP, MASS., U.S.A., BURNT OUT DURING CONSTRUCTION.

The débris of houses of ordinary construction also burnt can be seen in the foreground.

In machine shops and other plants requiring exceptionally heavy floor construction above the ground level, steel beams are frequently called into service. With these, if wide spacings of from seven to twelve and one-half feet are maintained, the advantages of standard mill construction are not forfeited if the steel members are suitably fireproofed. Desired floor stiffness between beams may be secured by making floors of two-inch joists on edge spiked together, the thickness of the floors varying with the loads and span from five to eight inches or more. This floor being practically a single unit, provision must be made for longitudinal contraction by making a continuous joist in the under flooring at intervals, with, of course, arrangement for tying the building together.

There is another matter which should never escape consideration in building a factory. This is the special fire hazard incident to the character of the factory product. Sufficient statistics are now available on almost every well-known manufacturing process to indicate just what elements in such process are especially susceptible to fire. Bulwarked by this knowledge, it is prudent to segregate from the principal values of the factory all special processes demonstrated by experience to be especially hazardous. This does not mean that such processes must be carried on in separate buildings at the cost of travelling time and inconvenience. The problem of segregation can now be met without shifting the process out of its logical place in the routine of manufacture. In a fireproofed factory only a separate room, or, at best, a separate floor, is needed.

Windows, whether in close proximity to other buildings or not, should not have wooden frames or any woodwork round about them. Iron or steel frames, filled with wired glass, are the most suitable form for efficient fire protection.

Fire Extinguishing.

On the question of fire extinguishing, the installation of an efficient automatic sprinkler system is of very great importance. It is highly desirable that fire, which may break out at night, or when buildings are locked up at the week end, should be extinguished at the earliest possible moment before the heat has attained a degree that will be destructive to the structure. It is also important that the hydrants should be fixed so that the delivery pipe is carried through the wall inside by the fire door of each section or department that can be isolated, and not merely in corridors or staircases outside them. In many cases, as at the Clapham Junction fire, the fire-doors could not be closed because of the hose passing through them, with the result that when employees have had to beat a hasty retreat the doors have been left open. An ample water supply is of course a necessity, and it is desirable to have a gravity system of sufficient volume and pressure to afford a good supply until the secondary pressure supply can be drawn upon. Where buildings are near enough to each other to make their roofs a point of vantage for the use of the hose, the standpipe should be extended to the roof.

We are informed that Messrs. E. H. Shorland and Brother, of Failsworth, Manchester, have recently supplied their patent Manchester stoves with descending smoke flues and ventilators to the workhouse infirmary extensions, Sheffield.

Fire Prevention Notes.

Electric Light and Fire Risks.

The Phœnix Fire Office Rules for Electric Light and Electric Power Installations, etc. have been translated into various foreign languages, and the pamphlet containing them is now in its thirty-eighth edition. The rules were compiled by Mr. Musgrave Heaphy, M.I.E.E., and were first issued in February, 1882, and each subsequent edition, up to 1908, was periodically revised by him; and the current edition has been brought up to date by Mr. S. G. Castle Russell, M.I.E.E.

* * *

Cheap Work that is Dear.

The general value of these rules may therefore be taken for granted; and if it be thought that in some particulars they are unnecessarily strict, that is only what must be expected in this or any other counsel of perfection. Adopting a popular paradox, it may be said that "the fault is a good one." The first word of the prefatory note is a piece of excellent advice: "If you put up electrical work to tender, remember this: that any firm by arranging to place inferior quality of work in your premises can easily underprice other firms that are more conscientious." Cheap and inferior work is likely to prove very dear in the long run, by causing, sooner or later, a fire, which may break out between floors and ceilings, behind wainscoting, or inside roofs.

* * *

Special Risks.

The special risks of various classes of buildings — theatres, drapers' premises, churches, factories and workshops, various kinds of mills, chemical works, breweries, central stations, engine rooms, motor garages, etc.—are very carefully considered. With respect to drapers' shops, the observations have particular interest and significance in view of recent disastrous fires "In these risks," it is advised, "the greatest care must be exercised, not only to keep the lamps, but all switchboards, switches, and cut-outs, at a safe distance from all combustible materials and goods. Care should be taken to render it impossible for goods to come into contact with incandescent lamps, fittings, or conductors. All arc lamps should be doubly enclosed. No portable incandescent lamps or flexible conductors should be placed in the shop windows or shops, or where there are inflammable goods. Switch and fuse boards should be placed on a brick or stone wall. They must not be on wood fittings, etc., containing goods, unless in substantial metal cases." Other risks, special and ordinary, are dealt with in the same practical fashion; and altogether the rules seem to be not only useful, but indispensable to the safe installation of electric light or power

INTERIOR OF A CONCRETE HOUSE AT WINTHPOP, MASS., U.S.A., BURNT OUT DURING CONSTRUCTION.

* * *

Fire Precautions at Hampton Court.

As we announced some time ago, the chief officer of the London Fire Brigade was invited to make a careful investigation of the arrangements for protecting Hampton Court Palace from fire risks. The chief officer has now presented his report, from which it appears that the first-aid brigade which is already in existence at the palace consists of about a score of firemen, who have a stationary steam fire-engine. There is, however, a local fire brigade of exceptional strength, the Hampton and Metropolitan Water Board brigades, which work together, comprising nearly forty trained men with four steam fire-engines. A wire between these and the palace, however, was said to be out of order when tried by the chief officer. Of course everything relating to fire prevention should be tested constantly—preferably every day—so as to ascertain that it is constantly kept in perfect efficiency and working order. It is to be hoped that these investigations into the means of preserving important buildings from fire may be extended in other directions. It is work that is well worth doing, and that has a threefold value—educational, practical, and stimulative of the public interest.

* * *

A Point of Etiquette.

An official at the palace has pointed out—and we quite agree with him—that "because the chief officer of the London Fire Brigade makes suggestions concerning the improvement of the fire precautions at Hampton Court Palace, it is not fair to assume that the present arrangements are unsatisfactory or inadequate." Such an imputation would be entirely unnecessary. At the same time, there can be no question as to the utility of such investigations; and the reports upon them should not be construed as reflecting in the slightest degree upon those who are responsible for the arrangements upon which such reports are made. It is surely no reflection upon a local brigade if the chief officer is able, from his wider experience, to point out possibilities of improvement in certain details.

* * *

Protecting Pictures.

An interesting point in the arrangements at Hampton Court Palace is that the Mantegna cartoons, "the chief glory and pride of the Palace," are mounted on wheels, and supported by hydraulic pistons, so that the turning of a tap brings each heavy cartoon to the floor, when it can be wheeled to a trap-door through which it can be lowered to the open courtyard. Some of the large pictures are hung by a chain, and can be quickly lowered by means of a pulley and crank; while small pictures of special value bear distinguishing marks which would secure for them prefer-

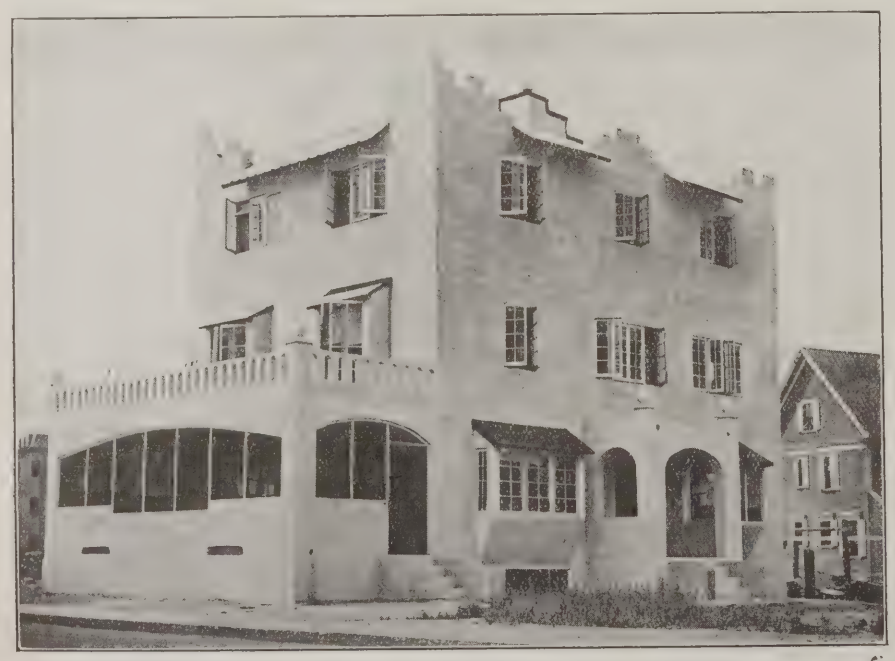

Photo: Topical.

EXTERIOR OF A CONCRETE HOUSE AT WINTHROP, MASS., U.S.A., AS COMPLETED AFTER BEING BURNT OUT.

Note.—The design of this house will hardly appeal to English readers.

ential attention in case of fire. There are, elsewhere, still some galleries in which priceless pictures are stuck fast to the walls, whence it would be difficult or impossible to remove them promptly in case of fire. The attention drawn to the case of Hampton Court Palace has been at least useful in revealing the better way.

* * *

Motor Fire Engines. Motor fire-engines seem to be everywhere superseding those in which horse traction was depended upon. The chief officer of Sheffield has signified his desire to "clear out the horses as soon as possible"; Clevedon U.D.C. contemplates the purchase of a motor engine; Belfast is about to spend £2,000 on motor fire-appliances; Leeds is applying for a loan to be similarly applied; Lincoln thinks of purchasing two motor engines; Cambridge is having a motor escape wagon built; and Manchester Watch Committee, favourably impressed by reports from Glasgow, Edinburgh, Liverpool, Portsmouth, Brighton, and elsewhere, is about to spend £2,200 on two motor fire-engines.

Notes on Competitions.

Wigan Elementary Schools.

Mr. J. W. Simpson, F.R.I.B.A., has recommended to the Education Committee that the awards in the plan competition for the new Council Schools at Beech Hill, Wigan, and Scot Lane, Newtown, be made as follows:—Beech Hill Council School, 1st, Messrs. J. B. and W. Thornley, architects, Wigan; 2nd, Messrs. Heaton, Ralph, and Heaton, architects, Wigan. Scot Lane Council School, 1st, Mr. J. B. Holland, architect, Pemberton; 2nd, Messrs. Prescott and Bold, architects. The recommendations have to be confirmed by the Education Authority.

Waterloo (Liverpool) Baptist Church and Schools.

The designs submitted in competition with twelve others by Messrs. George Baines and Son, 5, Clements Inn, Strand, W.C., have been adopted, and the scheme is to be at once proceeded with. The estimated cost, exclusive of Tower, is about £4,500.

Photo: Topical.

FIRE AT THE PAR HILL FEVER HOSPITAL, LIVERFOOL.

The officers' quarters were completely gutted by a fire commencing through the flame of a gas bracket catching a curtain.

Oldham Town Hall Extension.

The report of the assessor, Mr. G. H. Willoughby, F.R.I.B.A., in the above competition, which was limited to local architects, has now been published. The assessor selected the designs marked "O" for the first premium of £50, the design marked "D" for the second premium of £30, and the design marked "H" for the third premium. The authors were found to be as follows:—

Design "O," Messrs. Taylor and Simister, Queen Street.

Design "D," Messrs. Winder and Taylor, Union Street.

Design "H," Messrs. Jenkins, Matley and Mills. Queen Street.

Photo: Topical.

FIRE AT THE PAR HILL FEVER HOSPITAL, LIVERPOOL.

This fire shows the danger to which helpless invalids may be exposed in buildings not of fire-resisting construction. It will be noted that only the brick chimney breasts have survived. The danger of fixing gas jets in close proximity to curtains may also be noted.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

MAR. 21. PARISH COUNCIL OFFICES, BLAWARTHILL. Architects are invited to send in plans and estimates of the probable cost of Offices to be erected for the Renfrew Parish Council at Blawarthill, Roker Road, near Scotstoun West Station. A sketch of the site and other particulars can be had from the Clerk to the Council at 1, Manse Street, Renfrew, on payment of a fee of ten shillings, which will be refunded on receipt of a bona-fide set of plans, on or before March 21st. *No premium will be paid to Competitors, and the Council does not bind itself to accept any plan sent in.*

MAR. 31. SHEFFIELD ENDCLIFFE PARK CHURCH. Plans desired for Church for 650, Institute for 150, Primary Deartment for 125, Junior Department for 95, and Caretaker's Apartments. Premium, not merged in commission, £35. Assessor, Chas. Hadfield, Esq., F.R.I.B.A. Delivery on March 31st. On receipt of 5s. the Secretary, J. W. Nicholls, 64, Everton Road, Brocco Bank, Sheffield, will furnish conditions and instructions with plan of site, showing existing buildings, levels, and drainage—these not returnable. Deposit returned only to those who send plans.

MAR. 31. MUNICIPAL OFFICES, KARACHI. The Municipality offer a premium of 7,500 rupees (£500) for the best design, detailed plans and estimates for new Municipal Offices. Cost not to exceed 500,000 rupees, and the style of architecture is left open to the designers. Ferrotype plans of the site and a general arrangement of the floors of the building showing the accommodation to be provided, together with a copy of instructions to architects, will be supplied to intending competitors on application to the Chief Officer and Chief Engineer, Karachi Municipality. A charge of Rs. 5 will be made therefor, which will not be refunded. Each set of drawings must be sent in anonymously, but accompanied by a sealed envelope containing the author's name and address. Each set of drawings and all the documents required, including the sealed envelope, must be securely packed in a wooden box, addressed as follows:—The Chief Officer and Chief Engineer, Karachi Municipality, Karachi, India, and forwarded at the competitor's own risk and charges, in time to reach the Chief Officer or or before the 31st

day of May, 1910. It is proposed to apply to Government for permission for one of the chief architects to act as assessor to decide on the design to which the prize shall be awarded. The final decision of the assessor will be final and not open to dispute. The decision of the Municipality will be made within three months of the latest date for submission of designs, and payment of one-half of the premium will be made thereafter to the author of the selected design, the balance to be paid when the further details specified in the instructions to architects have been supplied. On payment of the premium the Municipality will have all rights in the design, with power to erect the building under its own agency, either according to the design selected or with such additions or alterations as it may deem necessary.

APRIL 23. COUNTY OFFICES, NAVAN, FOR MEATH COUNTY COUNCIL. The Meath County Council invite *architects in Ireland* to submit Plans and Specifications for the building of new County Offices at Navan. The Plans and Specifications to be submitted must be strictly in accordance with Report of Sites Committee as adopted by the County Council at quarterly meeting held on February 28th, 1910. The County Council will, at their adjourned quarterly meeting, to be held at the Council Chamber, Navan, on Monday, 25th day of April, 1910, at 11 o'clock a.m., consider, and, if they think fit, select and decide plans and specifications for new County Offices. Copies of Sites Committee Report can be had on application from the Secretary, Meath County Council, Navan. Plans and Specifications to be addressed to "The Presiding Chairman, Meath County Council, County Offices, Navan," and to be delivered at same not later than one o'clock p.m., on the date given. Hugh J. Cullen, Secretary, Meath County Council Offices, Navan.

JUNE 15. ELEMENTARY SCHOOLS, ACTON. Architects who have been in practice for at least seven years are invited to send in to the undersigned designs for the erection of new Schools at Rothscild Road for the Urban District Council of Aston Education Committee to provide accommodation for 850 scholars, at a cost not exceeding 10,000. An assessor will be appointed to assist the Committee in the Competition, and premiums of £100, £50, £25 will be awarded for *the Designs selected by the Committee after their consideration of the assessor's award, but the Committee do not bind themselves to appoint an architect to whom a premium is awarded. The successful architect will be paid a commission of 3½ per cent., and any premium awarded shall merge in that commission.* Particulars, showing the accommodation required and a plan of the site, can be obtained after April 5th, upon application and the payment of a sum of 10s. 6d., which sum will be returned after the premiums have been awarded, to each architect who submits a scheme for the proposed school. Canvassing the members of the Committee will be strictly regarded as a disqualification. F. A. Everitt, Secretary to the Education Committee, Council Offices, Acton, W.

NO DATE. COVENTRY NEW PUBLIC ELEMENTARY SCHOOL ENLARGEMENT OF STOKE COUNCIL SCHOOL. The Education Committee invite competitive sketch plans for a proposed New Public Elementary School in Centaur Road, and a proposed enlargement of Stoke Council School. The competition in each case is strictly limited to architects practising in the City of Coventry. Particulars of the competition may be obtained by any architect wishing to compete, on application at the Education Offices, Priory Row.

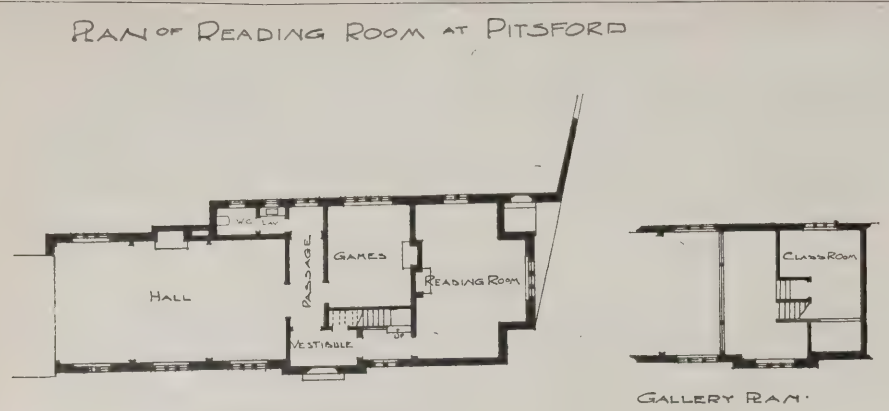
NO DATE. ELEMENTARY SCHOOL, BLOXWICH, for the County Borough of Walsall Education Committee. Designs are invited for the erection of a Public Elementary School (mixed) to accommodate 500 children, at Bloxwich. Conditions of competition and plan of site from W. Dawson Sadler, M.A., Director of Education, Council House, Walsall.

In Parliament.

(By our Press Gallery Representative.)

The Discovery at Hampton Court.

An interesting statement was made in the House of Commons last week by Mr. Harcourt with regard to the old moat and bridge which have been unearthed in the grounds of Hampton Court Palace. In explaining the supplementary estimate of £3,500 he said it had been suggested to him that it was possible that the old moat had been filled up, and that the bridge known to have been in existence and shown on old prints had been buried and not pulled down. This appealed to him as an interesting antiquarian possibility justifying a slight expenditure, and he had sinkings made where he conjectured the bridge might be. The whole of the ancient Wolsey bridge with the exception of a portion of the parapet was disclosed on further excavation, the arches being in a state of wonderful preservation. The walls of the moat also were in a good state of preservation. It had been filled in with rubbish, and many objects



VILLAGE HALL AT PITSFORD, NORTHANTS. P. MORLEY HORDER, F.R.I.B.A., ARCHITECT.

This hall is built of the local yellow Duston stone walling, with stone mullioned windows and lead lights in the local manner, and the roof is covered with Colley Weston slates. There is a small assembly hall with band gallery over entry passage and a roomy reading room and games room. A staircase leads to gallery and additional room at the back. A stage has been formed at end of hall and connected with an old house adjoining, one room of which can be used as a retiring room. The builder was Mr. H. Green, Ashburnham Road, Northampton.

READING ROOM, VILLAGE HALL, PITSFORD, NORTHANTS. P. MORLEY HORDER, F.R.I.B.A., ARCHITECT.

There is a small assembly hall with band gallery over entry passage. A stage has been formed at one end of hall and connected with an old house adjoining, one room of which can be used as a retiring room.

P. MORLEY HORDER, F.R.I.B.A., ARCHITECT.

of interest had been found and deposited in a temporary museum. A contemporary print showed Charles I. bringing his consort into Hampton Court over this bridge. It having been found impracticable to restore the water to the moat, he proposed to fill it up to the water level with soil and sow grass.

The Amenity of Hampton Court.

On the same occasion Mr. Harcourt mentioned that last year he purchased for £3,000 a meadow of seven acres in full view of Hampton Court, and on the opposite side of the river, which, it was likely, would have been utilised for a pumping or generating stations with tall chimneys, and unsightly buildings. This possibility it seemed to him would be such a disfigurement of the surroundings of a beautiful national possession that he decided to purchase the land. It was now let on lease for 21 years to a boat builder, the design of whose boat house would be subject to approval.

Ancient Monuments and an Anonymous Bequest.

The Ancient Monuments Protection Bill was explained by Mr. Harcourt in moving its second reading last Friday. He said the subject of ancient monuments was dealt with already by two Acts. The first related only to pre-historic remains. The second enabled the Commissioner of Works to accept other buildings by gift, but not by bequest. He had been offered by a bequest from a gentleman who would be nameless what might be regarded as the finest historical monument in this country. He was unable to accept the bequest without the authorisation of a bill such as he was moving. The bill was read a second time.

The Queen Victoria Memorial.

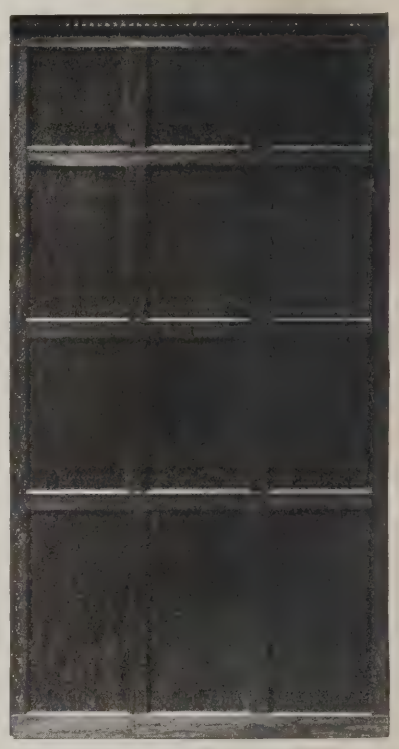
Mr. Douglas Hall asked the First Commissioner of Works, whether he could say when the Queen Victoria Memorial, facing Buckingham Palace, would be completed; whether any time for the completion was stated in the original contract or commission; and, if so, would he state the time; and was he aware that the present condition of the Memorial was an eyesore to everyone using the Mall.

Mr. Harcourt, in reply, said: I anticipate that the work will be finished in the course of the next twelve months. No actual date for completion was fixed in the original contract: the progress of sculpture is always doubtful, and it is not usual to name a date. Mr. Brock, the sculptor, asked for ten years, and the Memorial will probably be completed within seven years from the date of contract. This is probably an unexampled rate of progress for a work of this magnitude. In reply to the last paragraph, I have never yet seen any scaffolding that was not displeasing, and this one is no exception to the rule.

Mr. Bowles asked whether it was proposed to defer the opening of the Mall to Charing Cross until the completion of the Memorial.

Mr. Harcourt: No. I hope to open it as soon as possible, but I am rather depending on the work of the London County Council outside the confines of the Royal Park. It will certainly be this year.

MESSRS. H. C. CLEAVER'S NEW FACTORY FOR ARCHITECTURAL WOODWORK.



A factory that has been planned from the start for the particular purpose for which it is intended can hardly fail to present several points of interest. An example of this kind is provided by the Tudor Works, Park Royal, Willesden, N.W., which have been built for Messrs. H. C. Cleaver, Ltd. Situated on the Grand Junction Canal, the building is cruciform in plan, containing some 15,000 square feet on one floor, the offices overlooking all. British machinery of the latest type is installed throughout the works, and is so placed that the work moves steadily forward from the raw material at one end of the building to the finished article at the other. Electricity is used both for lighting and driving, the machinery being divided into groups connected to four separate motors by the British Thomson-Houston Co., Rugby. The whole of the shafting, motors, and electrical equipment are housed in a central subway, and two transepts below the floor. Here also are the desiccating chambers, where timber is dried before passing into the shops.

Waste is a word unknown at Tudor Works. Even the chips and shavings are pressed into service in specially constructed furnaces, to raise steam for the water-tube glue heaters and hot plates throughout the factory. Timber is barged from the London Docks, thus realising to the full the advantages of cheap water transport.

The products of the works embrace all forms of architectural and decorative woodwork, such as staircases, doors, chimneypieces in reproduction of Elizabethan, Adam, Louis XV., and Georgian work; panelling in all woods, including the well-known patent Tudoresk, in oak, wax polished and fixed complete, from 1s. 6d. per square foot; and lastly, a novel and interesting type of revolving door, the invention of Mr. Howard C. Cleaver. This door can be made single or double, is extraordinarily compact, being only 4ft. deep, is self-acting, noiseless, smooth running, draught-proof, and exceedingly decorative; it can be fixed wide open during summer months, and has admirable provision for prompt exit in case of panic.

Woodwork has been described as the noblest means of decoration; and the demand for it has advanced with almost startling rapidity during the past few years—especially for those forms of it in which artistry plays a conspicuous part, whether in the tasteful arrangement of simple panels or in the more elaborate effects of carving in the characteristic styles of various well-marked periods, or in the manner of distinguished carvers who have left enduring proofs of their extraordinary skill. Fortunately there is no lack of excellent examples. Artistic woodwork of exquisite beauty exists in abundance in our old cathedrals and in town and country houses, furnishing models that have a threefold value—they are a joy in themselves, they may be (and are) extensively copied and imitated or adapted, and they are a source of education and of inspiration to the modern woodworker.

What is more, these fascinating examples of early or later woodwork create in the public mind a strong desire for similar products. It is in order to keep pace with the demand thus stimulated that Messrs. H. C. Cleaver, Ltd., have specially planned and built their extensive new factory. The work there pro-

"TUDORESK" PANELLING: ONE OF MESSRS CLEAVER'S PRODUCTS.

duced, whether in wood or in composition, is of such character as to satisfy in an artistic way a large and growing demand. The best models and traditions are followed, and hence the public taste in such matters is not only gratified but encouraged and improved.

Fulwell Hydrated Lime.

A high-class Lime, slaked by a patent process, and packed in bags. Saves the labour of washing and running the lime, will not blow, leaves no waste, may be stored without deterioration and without bursting the bags.

For mouldings and lathwork can be gauged with a much smaller proportion of plaster than ordinary lime.

Converts lime into a safe, reliable and convenient material with the advantages of a bagged plaster.

Further Particulars and Samples from:—

The Exors. of the Late
Sir HEDWORTH WILIAMSON, Bart.,
Fulwell Lime Works, SUNDERLAND.

HOT WATER DAY AND NIGHT

Without Lighting the Kitchen Fire.

Inconvenience and possible Danger of being without Hot Water.

The use of Gas for Cooking—which by reason of its proved Economy, Convenience, Cleanliness and Drudgery-saving advantages, is rapidly becoming universal—is attended, in all cases in which the hot-water circulation depends entirely on the kitchen range, by the inconvenience (and, in cases of sudden illness, by the danger) of being unable to obtain hot water in the bathrooms and lavatories except with the expense, delay, trouble, and oft-times great discomfort entailed in lighting and keeping up the kitchen fire.

A Constant Supply secured independent of the Coal Range.

By the introduction of Gas Water Heaters of varying sizes, suited to different premises, and of Coke-Heated Circulators for large establishments, this trouble has been entirely overcome ; and it is now easy to obtain, at very moderate cost, **a constant supply of hot water throughout the house, quite independently of the coal-range boiler.**

Without interfering with the existing system.

The Water Heaters can be connected to the existing hot-water circulation pipes at a reasonable cost ; and, whilst the system makes the Hot Water Supply quite independent of the kitchen fire, it does not interfere in any way with the working of the range boiler, if the kitchen fire is lighted for other purposes, but can, in fact, be used in conjunction with the range if desired.

Full particulars respecting the system referred to above are contained in Illustrated Booklet ' 21 ' on Hot Water supply, which will be sent post free on application to

THE GAS LIGHT & COKE COMPANY,

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about five days or longer after the date of this issue.
Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders.
The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the Contract, which requires them to pay the rates of wages current in the district.

BUILDING.

March 18. **BRADFORD.**—Bricklayer's and mason's (labour only), carpenter's and joiner's, plumber's and glazier's, plasterer's, and slater's work required in the erection of a detached villa residence in Holme Lane, Bradford. Persons desirous of tendering will please send in their names to Wm. Rhodes Nunns, Architect and Surveyor, Bingley, on or before March 18.

March 18. **PURFLEET.**—Repairs, etc., to buildings in the barracks, army ordnance buildings, and magazines, and war department property adjacent (exclusive of rifle ranges) and works connected therewith, at Purfleet, Essex, for the War Office. Persons desiring to tender must leave their names at the Royal Engineer Office, Shoeburyness, on or before March 18, 1910, and pay the sum of 15s. for the schedule of prices which, with the form of tender, will be issued to each person applying.

March 21. **NAVAN.**—Residence at Abbeylands, Navan, for Jas. Finucane. Plans, etc., may be seen, and copy of bills of quantities obtained, on a payment of a fee of £1 1s., of R. Barnes, Tatestown, Navan.

March 21. **BUCKIE.**—Mason, carpenter, slater, plumber, plaster, painter and glazier works of proposed new Baptist Church for Buckie. Plans and specifications to be seen, and tenders to be lodged, with Geo. Macpherson, Architect, 29, East Church Street, Buckie.

March 21. **SHELFORD.**—Erection of a detached residence on the main road to Shelford, for the Rev. G. R. Frampton. Plans and specifications may be seen and full particulars obtained at the office of Frank Waters, Architect, 56, Hills Road (corner of Russell Street), Cambridge, to whom tenders must be sent.

March 21. **PYLE (Bridgend).**—Erection of 20 houses on the Kenfig Hill Road, near Pisgah Chapel, Pyle, for the Pyle Building Club. Tenders to be delivered to Aneurin T. James, Architect and Surveyor, Bisley House, Pyle, near Bridgend, at whose offices plans and specifications may be seen, and special forms of tender obtained.

March 21. **MARYPORT.**—Various artificers' work required in connection with the Central Hall. Contractors desiring to tender may inspect plans and specification, deposited at Maryport, on application to the architect, from whom quantities may be obtained. Tenders are to be delivered to J. N. Singleton, Architect, 61, Lowther Street, Whitehaven.

March 21. **LONDONDERRY.**—Rebuilding the Guildhall, for the Corporation. Form of tender, etc., can be obtained at the office of the City Architect, Municipal Offices, Foyle Street, Londonderry. Bills of quantities, etc., can be obtained from W. H. Stephens and Sons, Surveyors, 13, Donegall Square North, Belfast, on deposit of £5 5s.

March 21. **WATERLOO-WITH-SEAFORTH.**—Erection of a secondary and technical school in Cambridge Road, Seaforth, for the U.D.C. Plans may be seen and bills of quantities obtained at the office of the County Architect, Henry Littler, No. 16, Ribblesdale Place, Preston, by deposit of £3. Tenders must be delivered to John I. Thompson, Clerk to the Council, Town Hall, Waterloo.

March 21. **ST. HELENS.**—Erection of a new school, in North Road, St. Helens, for the C.C. On deposit of £1 1s. plans and specifications may be inspected and bills of quantities and conditions obtained at the office of the Architect, Frank S. Biram, George Street, St. Helens. Tenders must be delivered to Percival Sharp, Secretary for Education, Education Office, St. Helens.

March 21. **FERRYHILL (Durham).**—Erection of an inspector's house near Ferryhill Station, with outbuildings and storehouse, for the Weardale and Consett Water Company. Plans and specifications can be seen on application to the engineer, Mr. Askwith, M.I.C.E., at South Road, Bishop Auckland, and at the Company's Office, North Road, Durham. Tenders to be sent to Wm. Harding, Secretary, Crown Street Chambers, Darlington.

March 21. **WILLOWFIELD (Belfast).**—Erection and completion of St. Anthony's male and female schools, Willowfield, Belfast, for the Very Rev. H. Laverty, D.D., P.P., V.F., St. Matthew's. Bills of quantities have been prepared by Acheson Ferguson, Scottish Provident Buildings, Belfast, and can be obtained from him on deposit of £1 1s. Tenders to be delivered to J. J. M'Donnell, architect, 27, Chichester Street, Belfast.

March 21. **KNARESBOROUGH.**—Erection and completion of new council-room and offices in York Place, and Gracious Street, for the U.D.C. Drawings may be seen, and specifications, bills of quantities, and forms of tender obtained on application at the Surveyor's Office, Town Hall Buildings. A deposit of £1 1s. will be required for quantities. Tenders to be delivered to Thomas Mainman, Clerk to the Council, Council Offices, Kirkgate, Knaresborough.

March 21. **PAISLEY.**—Erection of iron roofing for new retort house, etc., and also for the extension of the gravity bucket coal conveying system, together with tower and conveyor track, and the erection of coal bunkers, at their gas works, Blackstoun Road, for the Corporation. Specifications and schedules may be obtained from Geo. R. Hislop, Engineer and Manager, Paisley Gas Works. Tenders to be lodged with Francis Martin, Town Clerk, Paisley.

March 21. **LEICESTER.**—Erection of new buildings and alterations at the town museum, New Walk, for the Corporation. Bills of quantities may be obtained at the offices of the Architects, Tait and Herbert, M.R.I.B.A., 18, Friar Lane, Leicester, upon deposit of £1 1s. Tenders to be addressed, "The Chairman, Museum and Art Gallery Committee, Town Hall, Leicester," and delivered to H. A. Pritchard, Town Clerk, Town Hall. Local firms only invited.

March 21. **HASLINGDEN (Lancs.).**—Carrying out of the whole of the work required in erection of a new farm house to be erected on a site adjoining the present Union farm buildings, for the Guardians. Plans may be inspected, and copies of the specification and quantities obtained at the office of the architect, A. Brocklehurst, St. James's Chambers, Waterfoot, on payment of a deposit of £1 1s. Tenders must be addressed to J. H. Sinkinson, Clerk, Union Offices, Rawtenstall.

March 21. **PATRICROFT (Eccles.).**—Erection and completion of extension to the Electricity Station, Cawdor Street, Patricroft, for the Borough of Eccles Electricity Committee. A copy of the bill of quantities and general conditions may be obtained from Edwin Parkes, Town Clerk, Town Hall, Eccles, on depositing the sum of 10s. 6d., to whom tenders must be sent. Plans may be inspected and further particulars obtained at the office of the Architect, N. Hartley Hacking, 50, Blackfriars, Manchester. The successful contractor must conform with the fair wages clause of the Corporation.

March 21. **RAMSGATE.**—Erection of a caretaker's cottage on the premises of the Ramsgate Secondary School, for the Kent Education Committee. Plans and specification and form of contract may be inspected at the offices of the committee, until the time appointed for the delivery of the tenders. Any person desiring to tender and to receive a copy of bills of quantities must send in his name to Fras. W. Crook, Secretary, Caxton House, S.W., accompanied by a deposit of £1, not later than March 10, 1910. Tenders must be delivered at the offices of the committee, Caxton House, Westminster, S.W.

March 21. **GLASGOW.**—Adaptation of premises, 31, Prince Edward Street, for the purposes of a telephone exchange, for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to the Clerk of Works, H.M. Office of Works, Head Post Office, Glasgow (Hanover Street entrance), and the building may be inspected between 12.30 p.m. and 2 p.m. Bills of quantities and forms of tender may be obtained at H.M. Office of Works, Parliament Square, Edinburgh, on payment of £1 1s. Tenders must be addressed to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

March 21. **GLASGOW.**—(1) Structural steel work; (2) builder's work; in connection with the provision of a new roof, Glasgow Cathedral, for the Commissioners of His Majesty's Works and Public Buildings. Tenders are requested for separate sections of the work under the above designations (1) and (2). Drawings, specifications, and a copy of the conditions and forms of contract may be seen on application to the Clerk of Works, H.M. office of Works, Head Post Office, Glasgow (Hanover Street entrance). Bills of quantities and forms of tender for the structural steel work and the builder's work respectively may be obtained at H.M. Office of Works, 3, Parliament Square, Edinburgh, on payment of £1 1s. Tenders must be addressed to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

March 22. **GRANGETOWN (Sunderland).**—Erection of a nave and aisle of the new church of S. Aidan. Plans and specification may be inspected on application at S. Aidan's Mission Room, Grangetown. Quantities can be obtained from W. Morton, Quantity Surveyor, 45, John Street, Sunderland. Tenders must be sent to C. Hodgson Fowler, F.S.A., Architect, The College, Durham.

March 22. **KINROSS.**—Mason, joiner, slater, plumber, and plaster work required for additions and alterations on The Manse House, Kinross. Plans may be seen at the office of the Clerk to the Heritors, or at the office of the Architects, Smart and Stewart, 42, Tay Street, Perth, from whom may be obtained schedules of measurement. Tenders to be lodged with W. K. Falconer, Clerk to the Heritors.

March 22. **FAREHAM.**—Erection of a hospital block at the Isolation Hospital, situate in Fareham, for the R.D.C. Builders and contractors desirous of tendering are requested to forward their names to Mr. Wilberforce Cobbett, Architect, Fareham, accompanied by a deposit of £3 3s., not later than March 12. Tenders to be delivered to Alfred Laker, Clerk to the Council, Union Offices, West Street, Fareham.

March 22. **BARRY.**—(1) Alterations and additions to Holton Road Infants' School, Barry; (2) plumbing work in connection with such alterations and additions, for the Local Education Authority Plans and specifications can be seen at the offices of the architect, G. A. Birkenhead, 102, St. Mary Street, Cardiff, and St. Nicholas Road, Barry, from whom bills of quantities and forms of tender can be obtained on payment of £2 2s. in the case of the building work, and £1 1s. in the case of the plumbing work. Tenders to be sent to T. B. Tordoff, Clerk, Council Offices, Barry.

March 22. **BIRKENHEAD.**—Alterations and additions to the master's office and the nurses' home, also for the erection of a committee-room, at the Union Workhouse, for the Guardians. Persons desirous of tendering may obtain a copy of the quantities from Edmund Kirby and Sons, Architects, 5, Cook Street, Liverpool, upon payment of a deposit of £5 5s. The persons whose tender is accepted will be required to enter into a contract with the Guardians, and to provide sureties for its due performance. The contractor in carrying out the contract will be required to pay the rate of wages and observe the hours of labour recognised and agreed upon between the trades unions and the employers in the district. Tenders must be delivered to John Carter, Clerk to the Guardians, Poor Law Offices, Birkenhead.

March 23. **MANCHESTER.**—Additions and alterations to the present boiler-house at the Workhouse at Crumpsall, for the Guardians. Bills of quantities may be had from the office of A. J. Murgatroyd, architect, 23, Strutt Street, Manchester, upon payment of a deposit of 10s. 6d. Tenders to be delivered to James Macdonald, Clerk to the Guardians, Poor Law Offices, New Bridge Street, Manchester.

March 24. **BURCHILL (Hereford).**—For erection of an isolation hospital and other contingent works for the Committee of Visitors of the Hereford County and City Asylum. Plans and specifications may be seen, and bills of quantities and form of tender obtained at the office of the County Surveyor, Shirehall, Hereford. Tenders to be sent to the Clerk of the Committee at the Asylum. A deposit of £1 1s. will be required.

March 24. **GLOUCESTER.**—Erection of a new general bath-house on the female side of the second county asylum at Barnwood, near Gloucester, for the Committee of Visitors. Bills of quantities can be obtained from the Clerk of the Works, Wotton Asylum, Gloucester, on payment of £1 1s. Plans and specification can be seen at the office of the Clerk of the Works aforesaid, and also at the office of the Architects, Giles, Gough, and Trollope, 28, Craven Street, Charing Cross, London, W.C. Tenders to be delivered to James Thompson, Clerk to the Visitors, Wotton Asylum, Gloucester.

March 25. **TINSLEY.**—1, constructing a fence wall; 2, wrought-iron railings and gates; for the Parish Council. The above are required for enclosing the recreation ground at Tinsley. Forms of tender and specifications of quantities can be obtained from J. L. Winkley, Clerk to the Council, 15, Harrowden Road, Tinsley, Sheffield, on receipt of stamped addressed foolscap envelope. Plans of the ground and of the work to be done can be seen at the Free Library, Tinsley.

March 25. **LONGLEE.**—Erection of masonry abutments and wing-walls in connection with the reconstruction of Longlee Bridge, over the Warks Burn, near Longlee, Wark-on-Tyne, for the Bellingham R.D.C. Plans will be deposited at "The Black Bull Hotel," Wark, and may be seen there upon application to John Charlton. Conditions, specifications, bill of quantities, and form of tender may be obtained from the surveyor. The surveyor will meet intending contractors at Wark on Thursday, March 17, at 1 p.m., and will explain the drawings and point out the site. Tenders to be delivered to R. E. Riddle, Surveyor, Percy Terrace, Bellingham.

March 26. **STURMINSTER MARSHALL.**—Building a new elementary school at Sturminster Marshall, Dorset, for the C.C. of Dorset Education Committee. Plans and specifications may be seen at the office of the County Surveyor, Wimborne. Tenders to be sent in to the Secretary, County Education Committee, Dorchester.

March 29. **HAYES (Middlesex).**—Erection of St. Mary's parish room, for the Executive Committee. Information, etc., can be obtained on application to C. Dudley Lewis, High Road, Hayes, Middlesex.

March 29. **WEST HARTLEPOOL.**—Erection of bandstand on the Green, Seaton Carew, for the Corporation. Plan, etc., to be seen upon application at office of Mr. Nelson F. Dennis, M.InstC.E., Borough Engineer and Surveyor, Municipal Buildings.

March 30. **RAMSGATE.**—Erection of a new elementary infants' school in Lillian Road, Ramsgate, for the Corporation. Persons desiring to tender must apply, or send in their names, accompanied by a deposit of £2 2s., to the architect, W. T. Stock, at the office of Hinds and Son, architects, 57, Queen Street, Ramsgate, when a copy of the bill of quantities will be at once supplied. Tenders, addressed to the Chairman of the Works Committee, are to be delivered at the office of A. Blasdale Clarke, Town Clerk, Albion House, Ramsgate.

March 31. **ASHBURTON (Devon).**—Addition to the Ashburton and Buckfastleigh Cottage Hospital, for the Committee Tenders to be addressed to H. Mallaby Firth, Hon. Secretary. Plan and specification may be seen at the hospital.

March 31. **WEDNESBURY.**—Erection of public sanitary conveniences (exclusive of sanitary fittings) near the Market Place. Plans, specification, and conditions of contract (no quantities) can be inspected, and form of tender obtained, at the offices of E. Martin Scott, Borough Engineer and Surveyor, Town Hall, Wednesbury, to whom tenders must be sent. The contractor will be required to pay the ordinary rate of wages current in the district.

March 31. **GATESHEAD.**—Erection of the Brighton Avenue new school, for the Education Committee. Send names to the Architect, F. W. Purser, West Street, Gateshead, who will supply quantities. Applicants must deposit a fee of £1 1s. Tenders should be sent to the Education Offices, Gateshead.

March 31. **YSTRADGYNLAIS.**—Alterations and additions to "Maesydderwen," to convert into County schools, for the Governors. Plans, specifications may be seen and bills of quantities obtained from the offices of J. Cook Rees, Architect, Neath. Tenders to be sent to B. L. Thomas, Clerk to the Governors, Tir Roger, Ystradgynlais.

March 31. **BERE ALSTON.**—New elementary school for 124 children at Bere Alston, for the Devon County Education Authority. Bills of quantities will be available in due course on payment of £1 1s. Contractors desiring to tender must apply to the County Architect (Education), 1, Richmond Road, Exeter, not later than the first post on Wednesday, March 9, 1910, enclosing a crossed cheque drawn in favour of the County Treasurer. Quantities will be issued about March 16, and tenders must be delivered at the Architect's office.

March 31. **BROMSGROVE.**—Erection of a Council secondary school, in Stourbridge Road, for the Worcestershire Education Committee. Applications for forms of tender and bills of quantities may be made by March 10, to the County Education Office, Worcester, accompanied by a deposit of £2 2s. The drawings may now be seen at the office of the architect, G. H. Gadd, Town Hall Chambers, Bromsgrove. Tenders must be addressed to the Director of Education, 37, Foregate Street, Worcester.

April 1. **ASTON.**—Aston Provided School.—Drainage and new conveniences (builder, joiner, and plumber), for the West Riding Education Committee. Plans may be seen and specifications with quantities obtained on application to the Education Architect, County Hall, Wakefield. A sum of £1 in each case must be sent by separate letter to the West Riding Treasurer, County Hall, Wakefield. Tenders must be sent to Francis Alvey Darwin, Clerk of the County Council, County Hall, Wakefield.

April 2. **CIRENCESTER.**—Demolition of buildings adjoining the Police Station, and construction of a new Superintendent's house upon the site, for the Gloucestershire Standing Joint Committee. Plans and copies of specification may be seen, and bills of quantities and forms of tender obtained at the office of E. S. Sinnott, M.I.C.E., County Surveyor, Shirehall, Gloucester. Persons tendering will be required to pay a deposit of £2.

April 2. **PERTH.**—Repair and reconstruction of the roofing on the west side of Perth General Station. The contract comprises steel and iron work, carpenter and joiner work, slater work, glazier work, plumber work, and painter work. Drawings may be seen at the office of the Engineer-in-Chief of the Caledonian Railway, Buchanan Street Station, Glasgow, where copies of the specification and schedule may be obtained on deposit of £2 2s. An assistant engineer will attend at the station on 21st inst., at 11.45 a.m. Tenders to be lidged with Geo. G. Hamilton, Secretary, Perth General Station Joint Committee's Office, Maritime Buildings, East Dock Street, Dundee.

April 3. **BUGLE (St. Austell).**—Erection of a concrete chapel at Bugle. Plans can be seen at Sunny Bank, Mount Charles, St. Austell. Tenders to be sent to the Rev. J. T. Morris, Primitive Methodist Minister, at above address.

April 5. **WALTHAM.**—Alterations and repairs required to be carried out at Waltham Council school, for the Committee. Specifications and plans can be seen at the house of the correspondent, C. J. Wanley Croft, Bridge, Canterbury. Tenders must be forwarded to the above-named correspondent.

April 5. **MOUNTAIN ASH.**—Erection of an infants' school, with offices, etc., at Clarence Street, for the Education Committee. Plans and specifications may be seen, and forms of tender and bills of quantities obtained, on application to the Architect, W. H. Williams, Town Hall, Mountain Ash, upon the deposit of £2 2s. The committee undertake to open only the bills of quantities sent in by the contractor whose tender will be accepted, and to return all the other bills of quantities unopened. Tenders and bills of quantities to be sent to A. Morgan, Director of Education, Town Hall, Mountain Ash.

April 6. **BOVEY TRACEY.**—New elementary school for 200 children, and a cookery and manual training centre, etc., for the Devon County Education Authority. Bills of quantities will be available on payment of £1 1s. Contractors desiring to tender must apply to the County Architect (Education), 1, Richmond Road, Exeter, not later than Friday, March 11, 1910, enclosing a crossed cheque drawn in favour of the County Treasurer. Quantities will be issued about March 22, and tenders must be delivered at the architect's office.

April 6. **EDENBRIDGE.**—Erection of a new Council school to accommodate 200 children, for the Kent Education Committee. Plans and specification, and form of contract, may be inspected at

(*Continued on next page.*)

Contracts Open.

ROYAL DERBY AND DERBYSHIRE NURSING AND SANITARY ASSOCIATION.

NIGHTINGALE NURSING HOME EXTENSIONS.

The Board of Management are prepared to receive TENDERS for the ERECTION of ADDITIONAL WARDS to the Nursing Home.

Plans may be seen and bills of quantities obtained at the offices of the Architects, Messrs. Thorpe and Fryer, 23, St. James' Street, Derby, on payment of a deposit of one guinea, which will be returned upon receipt of a bona-fide tender.

The Board do not bind themselves to accept the lowest or any tender.

Sealed tenders must be sent to me, the undersigned, marked "Nursing Home."

By order of the Board,
EDWARD S. JOHNSON,
Honorary Secretary.

Royal Nursing Institute,
London Road, Derby. 5601

TO CONTRACTORS AND OTHERS.

The Executive Committee of St. Mary's Parish Room, Hayes, are prepared to receive TENDERS for the ERECTION AND COMPLETION of St. Mary's Parish Room, Hayes, Middlesex.

The specification and drawings may be seen and forms of tender may be obtained at "Fairfield," High Road, Hayes, Middlesex, between the hours of 10 a.m. and 4.30 p.m., upon payment of a deposit of one guinea.

After the contract has been entered into the deposits will be returned to those contractors who have sent in a bona-fide tender, and have not withdrawn the tender.

Tenders, enclosed in sealed envelopes, and endorsed "Tender for Parish Room," must be delivered at the above address not later than noon on Tuesday, March 29th, 1910.

No tender will be received unless it be made upon one of the forms provided for that purpose.

The committee do not bind themselves to accept the lowest or any tender.

If required, the contractor must provide two sureties for the due execution of the contract.

C. DUDLEY-LEWIS,
Fairfield, Hayes, Middlesex.
5593

MARCH 18th.—**HIGHGATE.**

Contractors wishing to tender for the ERECTION of an ELECTRIC THEATRE and SHOPS, at Highgate, on bills of quantities, can send in their names to Messrs. Bennett and Stratton, Architects, The Broadway, Finchley. A deposit of 10s. is required. 5597

March 23, 1910. Volume 31, No. 790

P.C. and Provisional Sums.

We publish on another page a letter from a well-known Manchester builder which again raises the perennial question of the method of dealing with p.c. and provisional sums in bills of quantities. The existing method, based upon putting in the quantities net amounts to which the builder is asked to add such profit as he may wish, although apparently a simple and reasonable way of dealing with the matter, notoriously does not commend itself to builders. What builders say they want is that some moderate definite profit for the contractor shall be included in all p.c. and provisional sums. If the builder wants more profit than has been so provided, let him add it. If he is satisfied with less, let him take some or even all of it off, but at all events do not let it any longer be possible to make assertions such as those contained in the letter referred to. The present system leads to much friction between builders and specialists, and is probably injurious to the satisfactory progress and finish of work. When this question is raised, the stock reply is: "Well! why do not builders add profit for themselves as requested in the quantities?" The answer is: "Because they dare not if they want to be in the running for the contract." If we push our enquiry further, it appears that the real reason why they dare not add profit lies in the fact that architects and surveyors do not themselves consistently interpret alike the provisions as to p.c. and provisional sums. Consequently, contractors have to speculate on the kind of treatment they are likely to receive, and inevitably the result is as we have said. Perhaps the most satisfactory method is that adopted by the surveyor in a city in the North of England, whose practice it is to state in the quantities that the p.c. and provisional sums are net, and must be so paid on his certificate, but that at settlement, on production of the net settled accounts, a profit of five per cent. will be added for the benefit of the contractor. On every ground the settlement of this question is desirable, and might, we suggest, be brought about soonest by conferences between the local societies of architects and builders. After all, there can be no desire on the part of architects to deprive builders of a reasonable profit on the p.c. and provisional sums, but they do want to know what that profit is, so that they may be able to satisfy their clients that it is reasonable.

"Strenuous" Humour and Street Traffic.

An ingenious merry gentleman, as Addison might have called him, has an article in the current issue of a popular (and "strenuous") magazine in which he illustrates certain more or less whimsical suggestions for dealing with London's traffic problem. The article is entitled "Tackling the Traffic Tangle," with, for sub-heading, "How to Make London Life Less Strenuous." After that, one naturally expects an intensely practical and up-to-date solution of the problem, and probably more than half his readers will take him quite seriously; the sense of humour in the average reader of the popular (and "strenuous") magazine being inchoate. So far as can be seen, the author does not originate anything; he simply applies to "strenuous" practicality certain cunning inventions which have been hitherto mainly associated with "strenuous" amusement. He gets a photograph of some familiar London street scene, and on it adroitly grafts a flipflap or a switchback, with the most idiotic effects conceivable. Quite serious, however, and of comparatively decent appearance, is a view of Regent Street as it might appear if the shop windows were on the first floor instead of on the ground floor, balconies, spanned by bridges, running at the first-floor level on both sides of the street. Of course this notion of "elevated sidewalks" is by no means new, nor are its advantages very obvious. But the scheme is at least rational. So is not the suggested switchback route between Victoria Station and the Bank. "Why not," our humorist asks, "provide a cheap and satisfactory means of transit by erecting switchback routes, using the natural rises and falls [ominous expression] made by the roofs of buildings and the intersecting streets? The delicious whiz downwards, after a slope had been climbed, would act as a stimulus to the jaded system, and our doctors' bills would be halved if not abolished." Exactly. It would be distinctly bracing to the nervous system; and in the little accidents that must necessarily happen now and again, it would be quite superfluous to call in the doctor, except as an expert witness at the inquest. A flipflap in front of the Royal Exchange, or at Piccadilly Circus, would, our author urges, prove an incalculable blessing. "Thanks to these flipflaps, a trembling grandmother would be lifted in the air, say, at the corner of Shaftesbury Avenue, and deposited safe and sound at the corner of Piccadilly without the nerve-racking experience of making agonised rushes across the seething roadway, either with or without the kind assistance of an overworked policeman." Of course it is all very idiotic, as its sardonically humorous writer doubtless intends it to be; but surely the same adjective applies, with even greater force, to circumstances that give him the occasion of which he has made such adroit use. There are flipflaps and there are deadly dangerous street crossings. There is no sane reason why we should tolerate either; and the suggestion that they should be seen in combination is in reality an excellent stroke of satire, for which we are duly grateful.

Bricklayer's Bitter Cry.

Reinforced concrete construction has many enemies, but not all of them are so frankly reactionary as the brickmaker who recently wrote a letter of protest to a morning contemporary. "It is time," he says, "that bricklayers protested against the system of reinforced concrete recently [!!] introduced into this country. It is a system of building that encourages unskilled labour—the cause of unemployment in towns—and it ought to be checked. Bricks," he continues, "have been in use for centuries past, and have withstood all the weathers of all the ages. Therefore bricks should remain in use. By this means more employment would be provided for bricklayers, who are skilled mechanics." It is quite impossible to withhold all sympathy with this man's point of view, or to turn an entirely deaf ear to his exceeding bitter cry. It is equally impossible to grant him all his premises, logical or physical. Reinforced concrete construction certainly is checked, in various ways—by inconvenient by-laws, by the still unsolved problem of architectural treatment, by unfitness for small buildings; but to ask for legislative prohibition is to cry for the moon. Nor is it quite fair to say that the labour employed on it is unskilled; for we are being constantly reminded that success very largely depends on the careful supervision of experienced men. We fully share the love and praise of honest bricks; but that they are in any serious danger of being soon or generally superseded is surely a wild imagining of bitterness and despair. For the smaller buildings they are still, and are likely to remain, as in-

dispensable as they are appropriate; and as to their supersession in the larger works, it can only be said that events will take their natural course in spite of prejudice and protest. Is it not better, therefore, for architects, and indeed all sorts and conditions of builders, not to waste effort in futile opposition to the new movement, but to endeavour to be in it?

The Welsh National Museum.

Congratulations to Messrs. Smith and Brewer on their success in this big competition. Though competitions are frequently denounced as an unmitigated nuisance to the architectural community, and responsible for all kinds of evils, this competition proves once again how valuable is this method for discovering latent talent, and for enabling young firms to come to the front. Though it would, of course, be untrue to include Messrs. Smith and Brewer among neophyte firms of architects, since they are already well known for much delightful and valuable domestic work, we believe this to be the first occasion upon which they have launched out into the more strenuous flights of large public work, and their success is interesting as a proof of unusual excellence in two rather widely separated branches of the architectural art. Still, it is not unduly straining the point to say that it has brought three new firms into prominence in this class of work, while Mr. H. T. Hare maintains his reputation for either being top or very near it in big competitive work.

Municipal Trading.

The smouldering controversy between those who advocate and those who oppose municipal trading frequently bursts into flame in Leeds, where once again the rival forces have joined issue. Large sewerage works are in contemplation, and a deputation has waited on the Council to request that those works shall be carried out by direct labour. Fortunately for the ratepayers, Leeds has a powerful master builders' association, which is able and willing to present an overwhelming case for the other side. Its secretary, Mr. J. Davidson, has diligently collected and carefully digested a mass of data, of which already excellent use has been made. He has again stated his case with telling cogency, adducing several instances of the disastrous financial result of employing direct labour. Bradford, he points out, has had to abolish a slab-making department on account of its heavy loss; and he is able to show, from other specific citations, that the system has been wasteful and extravagant in the extreme. Moreover, private "employers have on many grounds greater incentives to closer oversight, and consequently a larger percentage of expenditure is available for actual wages when the work is done by contract than is possible where it is carried out under public officials"; while, on the other hand, "the keen competition during this period of continued depression makes it absolutely essential upon an employer thoroughly to organise his work, to use the best equipment, and to obtain a fair and honest day's labour for the standard wage which he pays." A further important consideration is that the supply of skilled labour depends entirely on private traders, since corporations do not take apprentices. This does not by any means exhaust the arguments against municipal trading; and, in fact, Mr. Davidson has put forward several other strong reasons why the particular work in question should not be undertaken by the corporation; but the arguments for and against municipal trading are sufficiently familiar, and it is hardly too much to say that the system has been everywhere discredited. The master builders of Leeds should therefore have no very difficult task in carrying their point.

Architecture and Airy Flight.

Aerial navigation seems at length to have emerged from that critical period during which it is almost impossible to discuss with high seriousness an innovation that lends itself to irrepressible jocularity. Barely a year ago, any suggestion that architects or engineers should give serious attention to the ways and means of housing air-ships would have been smothered in inextinguishable laughter, but now we find the Hamburg papers publishing a prospectus inviting subscriptions to a new company that is being formed for the purpose of constructing an airship dock at the cost of a million marks. It may therefore be assumed that the matter is beyond joking, and that those architects who are permitting their minds to speculate on the modifications or extensions of their art that are likely to ensue upon a vast development of aerial navigation need no longer be intimidated by ridicule. It is no very airy flight of fancy to imagine, for instance, that at some future period, perhaps not very remote, Gothic spires and other spiky skyward projections may be prohibited as dangerous to aerial navigation, while flat roofs with landing stages will be indispensable to every country mansion. At any rate, Count Zeppelin and his supporters have determined to make Hamburg the first point of departure for oversea airship lines, for which, in the opinion of the German aeronautic world, the time is now ripe; and this is a portent which it would be more absurd to ignore than to ponder.

London's Old Wall.

It is rather surprising how little is known of the wall that once surrounded London. When, in the course of demolitions or excavations for new buildings—as, for instance, on the site of the new post office in Newgate Street—portions of the wall are revealed, very little interest is awakened, and investigation is usually left to private enterprise. It is deplorable to reflect how much of historical and architectural interest has been lost through lack of systematic records. Mr. G. L. Gomme, F.S.A., Clerk to the London County Council, has recently stated that no direct record exists of the complete destruction of the wall, although it remained intact until well into the eighteenth century, and, as Mr. J. Landfear Lucas states, appears in perfect order in Jeffrey's "Plan of London" (1735). It had disappeared, however, when Rocque published his map in 1746. All the seven gates were taken down in 1760-2 Portions of the wall that are still exposed—as at St. Giles's, Cripplegate—are but little regarded; but such fragments are usually of exceeding interest to the builder when he comes upon them unexpectedly, as they cause an enormous amount of trouble in demolition, the stuff of which they are composed being of uncommon toughness and obduracy. Its constituents might form an interesting and perhaps instructive study to some member of the Concrete Institute who is not too proud to acknowledge that the most modern-minded man may still learn something from the ancients.

Mr. H. H. Statham and the Journal.

As most of our readers are already aware, this Journal, with its issue of April 6th next will enter upon a new phase of its existence. Commencing with that number, Mr H. H. Statham, F.R.I.B.A., will be associated with the editorial conduct of the Journal, which will thenceforth be known as "The Architects' and Builders' Journal." As has been explained in a circular that has been issued, the old title was, strictly speaking, comprehensive enough to include all sorts and conditions of builders, and very particularly the Architect or Chief Builder; but the slight modification of title will remove all possibility of apprehension as to the scope of the Journal. The number of pages will be increased, there will be more illustrations, and they will be more effectively printed on paper of superior quality. There will, in fact, be an all-round improvement in the appearance of the Journal and in the character of the contents. There will, however, be no change in the price, which will remain at twopence weekly.

Notes and News.

Rome's Proposed Boulevard.

Commendatore Boni has delivered before the King, the Minister of Education, and a large audience an eloquent lecture in defence of the natural beauties of Italy, and strongly urged that a huge boulevard should not be allowed to replace the Appian Way.

* * *

Kingston Bridge.

It has been decided to incur an expenditure of not more than £700 for the purpose of making an examination of the foundations of Kingston Bridge before finally deciding as to the widening or reconstruction of the bridge so as to increase its width to 55ft. At present a double line of tramway metals crosses the bridge, leaving a space of about a foot between the lines and the footway.

* * *

Town-planning Tour.

Under the auspices of the National Housing and Town Planning Council a visit has been arranged to Paris, Ulm, Vienna, Dresden, and Berlin. The date of the tour will be May 25th to June 9th, and its object will be the study of town planning in the various capitals visited, and participation in the International Housing Congress at Vienna. All applications in regard to the tour should be addressed to the Secretary of the National Housing and Town Planning Council, Leicester.

* * *

The Mall Improvements.

Sir Henry Tanner, on behalf of His Majesty's Office of Works, has submitted to the Improvements Committee of the Westminster City Council a plan showing the levels of the proposed new road from the Mall into Charing Cross. The plan shows the widening of Spring Gardens from 28ft. to 88ft., by adding to the public way the vacant site on the north side of the existing narrow street, as well as the adjacent land at present occupied by buildings, Nos. 55 and 56, Charing Cross. The necessary paving, etc., is recommended to be carried out, and that as the improvement is of a Metropolitan character, the London County Council should be asked to contribute to the cost.

* * *

The Venice Campanile.

It was hoped that the old Campanile of St. Mark's at Venice, which collapsed on July 14th, 1902, after an existence of 1,014 years, would have been completely replaced by Easter of the present year. There is, however, no possibility of the work being finished in time, but it is con-

fidently expected that the bell of St. Marco will again ring out on St. Mark's Day, April 25th, 1911. The intention was to reproduce the old tower as faithfully as possible, and with that object in view the bricks, of which there are about one million, have been specially selected and laid. The bricks are each 12ins. long, 6ins. wide, and 3ins. deep. The clay is twice mixed to secure homogeneity. These bricks contain salt, which threatened to turn the tower white. An outcry was raised, and the work was suspended while an inquiry was held. It was found that by prolonged soaking in water the salt was removed. The shaft, which was completed four months ago, is composed of an inner and an outer shaft, between which mounts the inclined plane which leads to the bell chamber. The walls of the outer shaft are 6ft. thick. The inclined plane is lit by 36 windows. In the new tower the shafts are bound together by iron rods, and the pilasters at the angles of the inner shaft are similarly united.

* * *

Northern Architects' Prizes. The assessors' awards in connection with the Glover travelling studentship and the students' prizes competitions have been announced at a meeting of the Northern Architectural Association, held in the rooms of the association, at Higham Place, Newcastle. It was found, on opening the sealed envelopes, that two firsts were obtained by Mr. G. E. Charlewood for measured drawings of existing work and architectural sketches, open to students under 21 years. In the same departments of work, for students under 25, Mr. W. Nimmo obtained both awards. The best set of testimonials on study required for the Royal Institute final examination was adjudged to be that sent in by Mr. Wilfrid Lawson. For similar drawings for the intermediate examination Mr. Joseph Hill and Mr. Stanley Milburn were bracketed. Mr. Joseph Hill was successful in winning the Glover studentship, which, subject to certain conditions being observed, carries with it the Glover medal and the prize of ten guineas.

A Campbell-Bannerman Memorial. In the Civil Service Estimates for 1910-11 the sum of £2,100 is set apart under the heading of "Campbell-Bannerman Memorial." This is in accordance with the decision of the House of Commons in May, 1908, "that a monument be erected in the Collegiate Church of St. Peter, Westminster, to the memory of the late Right Hon. Sir Henry Campbell-Bannerman, with an inscription expressive of the high sense entertained by this House of the eminent services rendered by him to the country in Parliament and in great offices of State." It is hardly necessary to point out that the Collegiate Church of St. Peter, Westminster, is the official title of Westminster Abbey.

* * *

Birmingham "Cathedral." The condition of the exterior stonework of the tower of St. Philip's Church, which serves as the cathedral for the diocese of Birmingham, has caused considerable anxiety to the Cathedral Council. During the last few years the process of decay has advanced to such an extent that something must be done to arrest it, if only in the interests of public safety. For some months a temporary wooden roof has been placed over the western entrance to the church to protect passers-by from possible injury through the falling of fragments of stone. During last year a special Tower Committee of the Cathedral Council was formed to ascertain what might best be done for the preservation of a piece of architecture which is of special interest as an example of the period to which it belongs, and is in some respects unique. The tower is illustrated in Mr. Reginald Blomfield's "History of Renaissance Architecture in England," and the author says:—"Thomas Archer (the architect of St. Philip's, Birmingham) was the son of Thomas Archer, M.P. for Warwick, and was a person of some consideration, being appointed Groom Porter to Queen Anne, George I., and George II. He was a pupil of Vanbrugh." "In 1710 Archer designed the Church of S. Philip's, Birmingham. The tower at the west end is helped by its commanding position, but it is certainly a powerful and original design, and unlike anything of its kind in England. Of its kind S. Philip's is one of the finest steeples in England." The Tower Committee have now formulated a definite scheme of renovation. The plan which they have adopted is that of renewing those portions of the casing which are hopelessly decayed, and of dealing with the rest of it by a preservative process of a special kind. The estimated cost of carrying out the proposed scheme of preservation will be about £2,000. The method decided upon is that in which here and there new stones are inserted. In other places breaks in the architectural lines and larger mouldings are built up with tile and cement, and the rest is treated with a silicate solution, enabling the surface of the old stone to resist the disintegrating effects of the weather. The net result will be to leave the appearance of the tower with its soft weather-worn aspect, but so to reinforce it as to enable it to endure for an indefinite period.

* * *

Individuality in Modern Art. Sir William Richmond, R.A., speaking at the recent dinner of the Royal Institute of Painters in Water Colours, declared English Art to be intensely interesting because every kind of temperament was reflected in it. "They felt that every artist had done a special thing because that was the thing he liked and wanted to do and because he did not want to do anything else. That, surely, was the great thing that moved the outside world more and more towards art. It was the feeling that each observer of a picture was coming into touch with each other individual who put paint upon a canvas or upon paper." Whether this insistence on individuality in English Art is quite a desirable matter, one may, however, take leave to doubt. The great masters were certainly not imbued

MURAL PAINTINGS AT ST. LUKE'S MISSION HALL, CHELSEA.

This very interesting scheme has been carried out by fourteen artists, under the direction of Professor W. R. Lethaby and Mr. Halsey Ricardo, the general arrangements being in the hands of Mr. Noel Rooke. The general motive is suggested by the signs of the Zodiac, with fruit and flower decoration appropriate to the months they represent.

with individuality in their early training; and the early works of Raphael, to mention one example, were as like those of his master, Perugino, as he could make them. In fact, the deliberate and conscious copying of the Italian masters' methods and styles by their pupils has made it necessary to divide Italian pictures into "schools," and many pictures, in the absence of definite marks and signatures, have to be attributed to a pupil of such and such a master. It cannot be said, therefore, that intense individuality was the moving force of the golden period of Italian Art; and it is open to question whether intense individuality all round is the best quality to produce a great art forward movement such as we desire. Individuality we certainly desire, but the individuality that is the product of discipline, restraint and subordination to accepted teaching. The individuality most apparent at the present day is something akin to the irresponsible whims of an uncorrected child.

* * *

"Square Chancels and Round Visits." We must relate a little tale against ourselves. In commenting on the lecture by Mr. Frederick Batchelor, President Royal Institute of Architects of Ireland, at Liverpool, last month, we referred to him as an Irish architect. This is hardly a grievous error, since Mr. Batchelor practises in Dublin; but we went on to refer to the "fine taste of the Irish in the Arts" and "to their natural gift of eloquence," attributes which were quite obviously based on the excellent lecture in question. A correspondent, however, points out that Mr. Batchelor is an English architect, who has practised in Ireland for some years past. Mr. Batchelor may take it from us, however, that Ireland has no monopoly in a fine taste for the arts or a natural gift of eloquence.

* * *

Unloveliness in Leeds. With the demolition of the old buildings at the end of South Parade, Leeds, the appearance of Victoria Square, a writer in a Leeds newspaper observes, has become still more uninviting. The square itself is paved with unsightly cobble-stones, which are a quite inappropriate setting to the three statues in it. Altogether the appearance of the Town Hall and the statues fronting it give visitors the impression that they have been dumped down anywhere without regard to surroundings. Time and time again has this dismal ugliness been commented on, though any material improvement is impossible without a wholesale demolition of many of the adjacent buildings.

THE WOODLANDS MINING VILLAGE, NEAR DONCASTER. GENERAL VIEW ON THE GREEN. PERCY B. HOUFTON, ARCHITECT.

This is a very complete scheme, necessitated by the opening of a new colliery. Mr. Houfton, who is already well known for garden-city work, has made of it a very complete garden-village scheme, and one which is regarded as one of the most satisfactory yet carried out.

The Horniman Museum. The London County Council has received an offer from Mr. E. J. Horniman to expend a sum of £4,500 on the building of a suitable lecture hall as an extension of the Museum to seat about 200 persons, and for the provision of better accommodation than is now available for the library. The gift is conditional on the design of the hall being approved by Mr. Horniman, and on an undertaking that at least 48 lectures shall be given to teachers or children free of charge.

* * *

Sticke Courts. Some interesting particulars are given in a recent issue of "The Times" concerning the game of stické, which is not very well known. Particulars of the court will be useful to readers who may be suddenly called on to provide one. The dimensions are those of a new court now being built at the Queen's Club, West Kensington, and this in turn is based on a court erected at Esher some years ago. The court is 78ft. long by 27ft. wide, and is enclosed by walls 9ft. high, above which is stretched wire netting at least 6ft. high. The walls are of wood, and the floor of the court is made of concrete, cement faced. There is no roof. In each corner of the court a square of 9ft. is marked out, in which the server must stand; the service line runs across the court 18ft. from the back wall. The net in the middle of the court is similar to that used in lawn tennis. Above the net and 8ft from the ground is stretched a tape, above which the server must serve the ball. The Tennis and Rackets Association have standardised the measurements of the court. It should be noted that from the centre of the court to each of the back walls the floor has a slight fall, so that rainwater may drain away rapidly after rain.

The Abolition of White Lead. We notified some time ago the passing, by the French Government, of a measure prohibiting the use of white lead as a basis for any paints, or for use in house-painting. The abolition is to be gradual, five years being allowed for the extinction of the trade. The Chamber of Deputies and the Senate came into collision over the question of compensation to the white lead manufacturers, the Senate standing out for compensation, and the Deputies refusing any indemnity to the manufacturers of "murderous products." Commissions were appointed by each house, but the Senate has finally given way, though the delay in the operation of the law has been agreed to. The essence of the agreement is that in five years after the promulgation of the law the use of white lead and all products containing white lead shall be prohibited in the painting of buildings, both of the exterior and the interior.

COLOURED MATERIALS IN BUILDING.

By HALSEY RICARDO, F.R.I.B.A.

[*These notes are an abstract of a Lecture delivered by Mr. Ricardo at the Carpenters' Hall. Mr. Ricardo is well known as the leading advocate of colour as an essential factor in modern architecture, and advocates the use of glazed materials for buildings in cities. Such buildings alone can resist the smoke and grime of modern towns, and can be periodically rejuvenated by washing down. A house in Addison Road, London (shown in this issue) was designed by Mr. Ricardo, and is a practical illustration of his theories.*]

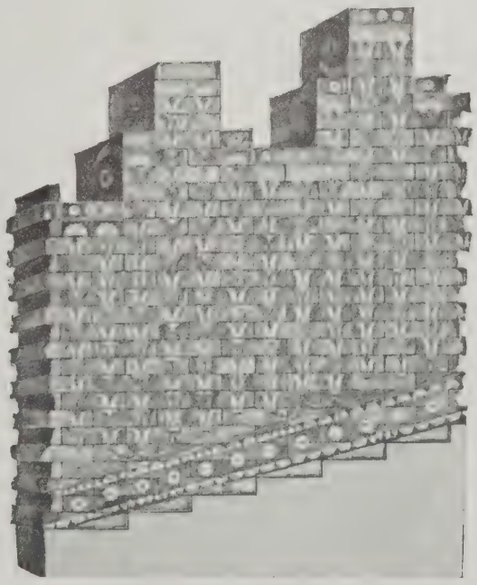
Retrospective.

Mr. Ricardo said his paper was mainly retrospective of what had been done in colour building. It went back to ancient history—in fact, it goes back to the garden of Eden. Man has used colour in the heraldry of his dress and in the heraldry of his buildings from earliest times, in a manner at once intelligible to his tribes and to his enemies. In the garden of Eden, which we now call Mesopotamia, the use of colour building came about from the pressure of constructional conditions. Their houses were built for the most part of sunburnt bricks made from alluvial clay. These bricks, so long as they kept out the rain, met all their needs, but the rain turned them into slime, and they were a poor defence against hostile tribes. The remedy was to coat them with a coat of mail. Kiln-burnt bricks would do this, but fuel was scarce. They found that a glazed brick fused at a lower temperature, and was more durable. There are immense mounds existing to-day which show the deliquescent nature of their mud bricks. They are the ruins of walls and palaces, and there they remain, great silent heaps of soil, to this day. Experiment led them to discover colour glazing. About 600 B.C. the axiom in their minds was that their buildings must be sheathed to preserve them. The lecturer briefly described the Babylonian cities, with their tiers of terraces, and on the top terrace was placed the king's palace, and the astronomers observatory above it. A side of a staircase from one of these was exhibited on the screen, showing the application of their coloured bricks. The material was not fire-clay, it would not stand great heat, and was easily fused, the colours being yellow, green, blue, and white. One has to remember that at the back of their minds, before ever architecture was, there were many other arts, and especially the art of weaving. They lived in tents before they shaped stone, and they weaved and dyed, and when they built walls, what they did was, they either hung tapestry on the walls or gave something akin to a woven texture. This ideal was an accepted thing in the East. It was accepted by the Greeks, who heightened their sculptural work with colour, and by the Romans, who followed the Greeks, but were more profuse. The gateway of a mosque in Persia showed the whole building sheeted with enamelled plaques or tiles. The condition of colour in the East was accentuated by the conditions of climate. The winter was dry and arid, then came the spring with a great sprouting of almond and maize and rice, which was soon over, followed by the summer, very hot and very dry, with a great absence of colour. That they compensated for by colour on their buildings. A mosque in Persia was shown with the whole face of the masonry covered with plaques of colour—not any great variety of colours; you can see types of them in South Kensington Museum. But see what a refreshment in a dry city it must be to have a building glowing like a rainbow! A small building, part of the Mosque of Omar at Jerusalem, showed the treatment of marble used as a plaque. It was done quite frankly as a painting, with no attempt at constructional value; the windows being made of pierced marble.

Some Examples of Colour Architecture.

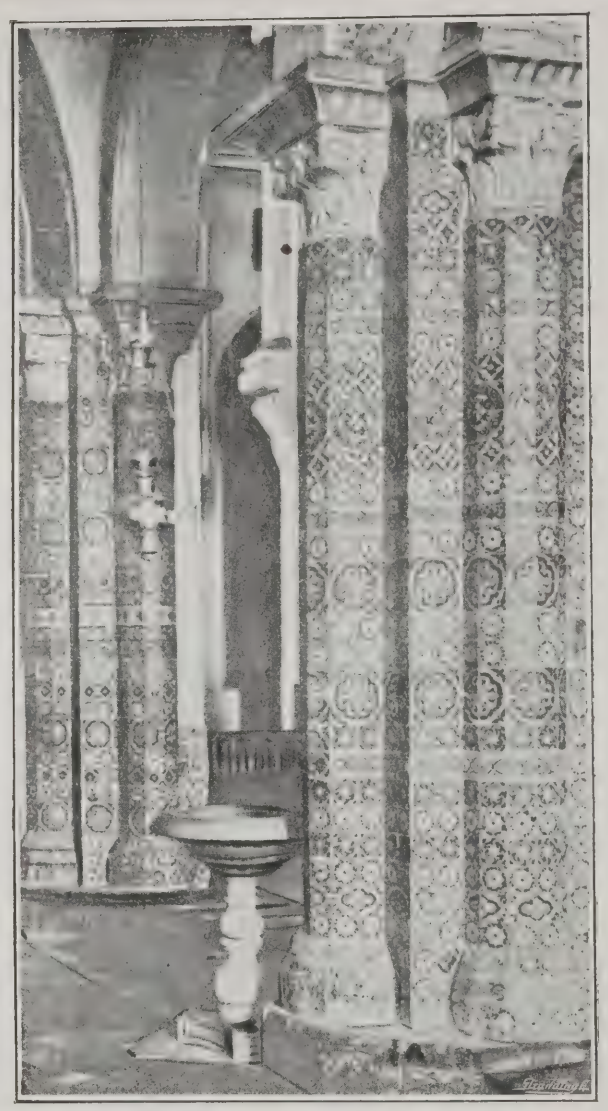
An interior view of Santa Sophia at Constantinople, looking towards the east end, showed several treatments—the plating of marble with faience, then mosaics over, and then those great circles containing pieces out of the Koran, which were very decorative. All mosques had a courtyard, where people cleaned themselves and settled themselves into a peaceful frame of mind before going in. One of these showed the constructional use of marble, with relief of sculpture and arabesque plating of the wall surface, and on the walls in the courtyard a tile decoration after the style of arras. An antechamber in the Alhambra was shown where ablutions were performed before entering the presence of the Amir. Here again we see the revel and delight with which they used their colour. Spain has much in common with Persia—stony, dry hills, with not much vegetation; so in their houses they tried to make up for it. The Hall of the Ambassadors at Seville is a riot of colour. An interior of a church at Monreale in Sicily showed a marble dado, which is in reality quite a textile hanging of a beautiful quality. The Crusader on his return home had strange tales to tell of the wonderful buildings he had seen on his journeys. His listeners were not to be crushed by his extravagant accounts, and the craftsmen of the twelfth century wanted nothing to spur them on. Florence, Pisa, etc., grew up in coloured stone, and marble mosaic lent its aid to the decoration of cathedral fronts. The baptistery at Pisa is a wonderful fusion of different coloured marbles, and panels put in. The marble for the most part is taken as it should be, as a species of jewellery which you can apply. The Duomo, Lucca, is a little nearer a marble country. They take their work a little more constructionally. The front is built of marble. They carved their marble friezes into figures, etc., and then filled them in with varied coloured marbles, so as to form an inlay. The Duomo at Florence, with the base of Giotto's tower, shows the constructional method with the application of coloured work.

A Mediæval Example.



The great front of Orvieto Cathedral gives one a much fairer idea of what mediæval architecture was than the cathedrals we see now, all bleached, with the colour all gone We talk learnedly about form and proportion, light and shade, a thing which did not concern them perhaps one bit. They formed their front first for ritual. The churches, especially the portals, were the bibles of that time—their legends and the history of the gospel were there. The statues were not the frozen figures we see now; they were coloured to look as real as possible, illustrating the lives of men before Christ and great men after Christ. Those who came to see them either knew the story or would be told it by others. Such of the colour as remains to this day gives one a very imperfect idea of the original effect. We only get the ground colour—the base. In answer to a query, Mr. Ricardo said that the kings in the front of Wells Cathedral were undoubtedly coloured, with a background of azure.

Glazed Terra Cotta.



Terra cotta, at first unglazed, becomes in the hands of the della Robbia family the supreme expression of colour sculpture. Terra cotta being a moulded material, when you have made your mould you may as well take 50 reproductions as one, so you should use the decoration profusely. The Ospedale del Ceppo at Pistoja, which was shown, is an example of a succeeding generation of Luca della Robbia. It is the shelter to the hospital for the lame, and all along are representations of the people to whom it is the duty of the hospital to minister, carried out in glazed terra-cotta and the roundels filled with patron saints. The building generally is in grey stone, and these plaques are inserted as jewels.

St. Mark's, Venice.

In the front of St. Mark's we get an idea of what Venice appeared like in the sixteenth century. This front may be looked upon as a

COLOURED MATERIALS IN BUILDING: RAMPED DADO TO STAIRWAY IN ASSYRIAN ENAMELLED BRICKS.

COLOURED MATERIALS IN BUILDING: INLAID MARBLE PIERS, COIMBRA CATHEDRAL, PORTUGAL.

gorgeous monument of plunder from the East; all the beautiful columns being plundered or pilfered. The Courtyard of the Ducal Palace, Venice, showing the Giant's Staircase, was illustrated as showing the architect's sympathetic use of the marble, using the coloured marble for panels, etc., and the white marble as a frame to the coloured work, the white marble only being carved. The outside of the Ducal Palace was shown, with its front composed entirely of two marbles—one Istrian, which is inclined to go yellow, and the other almond blossom inclined to go russet. By now the craftsmen had spread into different branches of the building crafts; the masons' guild became bare; the artist, too, who had found that in careful measuring of buildings, and in looking at colourless images, began to talk about proportion. Gradually the working and jointing of the stone was all the mason had to think about. Into the middle of this languor came the Gothic Renaissance at the beginning of the nineteenth century.

Butterfield's Example.

Mr. Butterfield in the quiet of his office schemed out elaborate designs and set them down on paper, stone for stone, brick for brick, so that there was no chance of anything going wrong. He was a great artist, and had trained himself in mediæval methods. For all this there is a difference between the scholarly touch of the architect and the Gothic craftsmen. Time, however, is already justifying Mr. Butterfield's confidence in his actions. Keble College, Oxford, was shown, and also Keble College Chapel, which Mr. Ricardo said rather exemplifies the insistence of the individual. The interior of All Saints', Margaret Street, which is a church built under great difficulties, has no east window, lighting only from clerestory and west window. Several views of Holt Place, in Norfolk, by Mr. E. S. Prior, were shown. Attention was drawn to the use of tiles as lintels, courses, wreaths in chimney stacks, etc., the other materials being flints and pantiles on the roof. The colour to the house in Addison Road belongs to another category: instead of natural materials we have artificial materials covered with a glaze. The greater part of the building is in white Carrara ware, with green panels. The interior of the hall is lined with de Morgan's blue tiles in a great variety of colour. The justification for using such a material lies in the corrosive action of the atmosphere of our manufacturing towns. If we get rid of the soot from our chimneys we cannot get rid of the acids from our manufacturing chimneys. To clean brick and terra cotta is to court their destruction, so we are driven to employ glazed surfaces, and are forced to use colour. The fact that glazed bricks and glazed terra cotta are unchangeable, and that the building is impervious to wind and rain, is not sufficient were it not for the colour. Nor can we question that colour is the desire of man's heart. Finally the lecturer expressed a hope that as trees are now usually planted in newly laid-out streets presumably for their colour, so more colour would be introduced into the buildings to temper the lot of the thousands who fled nightly from this miserable place of colourless monuments in stone.

A Plea by Mr. Joseph Armitage.

[In a lecture on "Wood-Carving," read before the Leicester and Leicestershire Society of Architects, Mr. Armitage made a strong plea for Colour Architecture, which is not without its interest here.]

Compare the best or even the most extravagant of modern work with the work of the ancients of which we have descriptions, and I think you will agree with me that we show a distinct lack of the spirit of adventure in our treatment of wood.

Take, say, the description of Solomon's Temple, which can be built up from references in the Bible. It was built of stone, lined with cedar, and consisted in the main of the Holy Place or nave—a rectangular chamber of 2 cubes of 24 feet, and the Holy of Holies (answering in plan to our chancel) of 1 cube of 24 feet. The porch at the East was lined with cedar and the olive wood doors to the Holy Place were 4-leaved, carved in low relief and overlaid with gold.

The Temple was a place of thick darkness, so there was a shallow vestibule with inner doors of cypress wood, carved as the outer doors. The Holy Place and the Holy of Holies were lined with cedar, and the roof was of beams and planks. On the walls were carved cherubim, palm trees and open flowers, covered with gold fitted on. The ceiling was overlaid with gold and the cedar door was plated with gold. Dividing the Holy Place from the Holy of Holies was a screen of 6 pillars which reached half-way to the ceiling. Double doors of olive wood filled the centre opening, and were carved and overlaid with gold. A curtain (the Veil which was rent at the Crucifixion) hung over the screen on the outside and was blue, embroidered. Against the walls in the Holy Place were 10 tables bearing 10 seven-branched candlesticks, five of which burned by day and five by night. These were the only lights in a chamber 48ft. × 24ft. × 24ft. Think of the beauty of the golden chamber—the Holy Place, with its blue embroidered veil, in the dim candlelight.

Of the wood effigy, at Fersfield, Norfolk, of Sir Robert du Bois, d. 1311, Blomefield the historian, who was rector of the church early in the eighteenth century, records that he found part of the original decoration perfect, the cushions being flowered with silver on red and gold on green, other enrichments being gilded on a cement and let into the wood in several places on his belt, sword, and spurs, and then covered with glass, but most were defaced; but as the figure was very dirty, he had it washed very clean and caused the whole to be repainted.

These descriptions of ancient work sound extravagant and almost vulgar to modern ears. Modern life is grey. We live in the steel and concrete age, but the old builders revelled in colour—strong, rich colour, boldly used in ways which almost make us shudder to hear of. Think of the west front of Wells painted, for instance, or the interior of Westminster Abbey with the walls white lined with red, diaper work of the triforium gold on red ground, wall arcades vermilion and gold, the capitals, the sculptured bosses, the shields in the aisles outside the choir with straps and heads to which they appear to be suspended, gilt and coloured; the screen between presbytery and Confessor's chapel decorated with azure and vermilion, with mouldings and carvings gold, and the altar and all placed near it gilded. The marble work, polished and varying in colour, from grey-green to purplish-grey, must be remembered when we try to conceive the colour scheme. It sounds gaudy, and the description of the statue of Athena sounds vulgar, but can you imagine vulgarity enshrined in the Parthenon, or men capable of the Chartres glass spoiling their exquisite work with colour?

Why are we so much afraid of colour? Largely, I think, because we are still under the influence of the Puritan idea that beauty is the enemy of the soul.

Correspondence.

Prime Cost and Provisional Sums.

SIR,—It would, I think, serve a good purpose if architects and others whom it may concern were asked to consider the important question of the discount which should be allowed to the builders and included in the p.c. prices and amounts of provisional sums included in architects' quantities.

Architects and public bodies have of late adopted a system of fixing up nett prices and contracts with manufacturers and specialists, and afterwards issuing certificates on the builder, who is called upon to pay on demand the nett sum included in the bills of quantities, without any discount for cash.

This system, I maintain, is very unfair, and totally opposed to business principles, in so much as the builder is requested to accept the estimates of the manufacturers and specialists, order the goods, give all instructions with regard to supplying same, take all responsibility, give every assistance and facility for the carrying on of the special work, allow use of scaffolding, and pay cash immediately the architect issues his certificate, notwithstanding the retention of money to the amount of 20 per cent. on the contract during the progress of the work, and having to wait twelve months for the balance.

I beg to suggest that architects responsible for arranging the p.c. prices or provisional amounts, should provide for a discount to be allowed by the manufacturer or specialist to the builder, or the manufacturer and specialist should combine with the builder to ensure this discount.

Manchester.

Views and Reviews.

Modern House Construction.

It was an excellent idea to deal with the principles of modern house construction sectionally, and to allot each section to a writer who is a specialist in his own department, the only drawback being the bulk and expense indispensable to such an ambitious undertaking; the work being in six volumes, which, however, although of large quarto size, and printed in large type, with sumptuous margins, all in the "grand manner," are not unwieldy, but, by reason of their comparative slenderness, are light and convenient in the handling.

The editor and the publishers are certainly to be congratulated on the courage with which they have acted on the recognition that a large subject should receive large treatment. Glancing through the volumes in this new edition, we feel justified in expressing the opinion that, on the whole, the book is marked by soundness and thoroughness. Its chief value to the architect, we imagine, will be found in the sections that have been written by others than architects. The purely architectural sections, while serving undoubtedly to refresh his memory and consolidate his knowledge, cannot be reasonably expected to tell him anything fresh; but, on the other hand, he may expect to obtain a good deal of substantial information from the experts who write on water-supply, on sanitary plumbing, sanitary fittings, drainage, sewage disposal, warming, ventilation, lighting, decoration, and furniture in their sanitary aspects, sanitary law, and other subjects on which the architect naturally seeks the aid of the specialist.

The illustrations are abundant and useful, and, like the text, have been carefully revised and considerably amplified, and include an ingeniously devised paper "model," in which the various parts of a house are superposed, so that, for instance, by lifting the ground-floor picture you reveal the foundations, and so forth. The general get-up of the work leaves nothing to be desired.

A Useful Pocket Book.

Mr. H. G. Richey is an American author who is responsible for a number of useful works of the pocket-book character, in particular a number of books known under the title of "The Building Mechanic's Ready Reference," of which there are various editions for carpenters, wood workers, stone and brick workers, plumbers, steam fitters, and finally, "The Building Foreman's Pocket Book and Ready Reference." This last named work is larger than the others, and is about as big as the author's "Handbook for Superintendents of Constructions, for Architects, Builders, and Building Inspectors." We suppose that every additional volume that Mr. Richey turns out makes it easier for him to produce pocket books for various classes of purchasers connected with the building trades. Certainly we find—though there is a good deal of duplication in the various volumes—that each book seems to have a special value to the ordinary student of building construction in the wider sense. This foreman's pocket book is indeed very valuable. It contains a mass of information, and from one point of view we may say that it is a very comprehensive work on the subject of building construction work generally. A building foreman has to deal with so many subjects in his work that it is natural for this book to be almost all-embracing. There is a valuable introductory chapter on the duties of a foreman and the points to be observed in commencing any work; then the various trades are dealt with, and many valuable tables and data of all kinds are given, which will provide a foreman with practically every thing that he requires, and will assist in providing information on out-of-the-way points that seldom arise in the ordinary run of practice and may not come within the experience of the majority of foremen. The book is, of course, written for the United States, but it will be of almost equal assistance to English readers. It was perhaps only to be expected that a new subject such as reinforced concrete would not be dealt with in these general text-books and aid-books so thoroughly or so authoritatively as in special books on the subject, for knowledge grows at such a rate nowadays that it needs a specialist to keep up-to-date; therefore, we find that Mr. Richey, though he has made an effort to record the latest practice, does not really deal at all adequately with the subject of concrete and reinforced concrete; he makes only a digest of information obtained from various sources, such as some popular hand-books

COLOURED MATERIALS IN BUILDING: INTERIOR OF SIENA CATHEDRAL, LOOKING EAST.

"The Principles and Practice of Modern House Construction," including plan and design, construction, water supply and fittings, sanitary fittings and plumbing, drainage and sewage disposal, warming, ventilation, lighting, stables and cow-houses, sanitary law, etc. By many leading specialists, under the Editorship of G. Lister Sutcliffe, A.R.I.B.A., M.S.I. New edition, thoroughly revised and considerably extended. The Gresham Publishing Company, 34 and 35, Southampton Street, Strand, London.

issued by American Cement Companies. We find builders' foremen and mechanics, engaged in building work, often hopelessly ignorant of the manner in which to make concrete properly, and of the carrying out of reinforced concrete work, so that it is worth while making some effort to provide in this book such important information. We feel sure that Mr. Richey could view it from the right standpoint, and, while not going into the subject of design, could give the foreman a clue to the designer's ideas and the importance which attaches to the most careful carrying out of every little detail. If the importance of the details is not understood, and the designer's object appreciated, inaccurate workmanship will result, and the consequences are very serious. There is a certain amount of information of an ordinary character provided about various kinds of reinforcements, and a few systems, but the principles of design are ignored; therefore, even a careful reader of this work will not understand the drawings he may be provided with, and as it is often impossible to provide inspectors to check and watch every detail of practical construction there is a liability for serious error. If a multitude of sins are covered by the concrete, and the work holds up, it may be almost upon the point of collapse, and its life in a building may be very short. In the more ordinary subjects of building construction Mr. Richey's hand-book is, however, admirable, and it seems to provide most information likely to be of service, for it is no use in a book of this character trying to give too much; severe pruning must be done to compress the matter into the space available, and we are sure that the author has done his work very well.

"The Building Foreman's Pocket Book and Ready Reference." By H. G. Richey. London: Chapman and Hall, Limited. Price 21s.

Legal.

The Quality of Bricks.

At the Manchester Assizes, before Mr. Justice Walton and a jury, an action was brought by Henry Thomas Kenyon, of Prestwich, trading as the Standard Brick and Terra Cotta Company, at Buckley, Cheshire, to recover damages from J. T. Moore, builder and contractor, Eccles, for breach of contract.—It appeared that the defendant arranged with the Eccles Corporation to build them a school, and he contracted with the plaintiff for a supply of bricks. The order was for 45,000 seconds glazed bricks. Two truck loads were delivered and rejected by the clerk of the works. The contract was thereupon cancelled by the defendant. The plaintiff's case was that the bricks were as good as any that could be secured at the rate of £7 per thousand. A representative of the plaintiff company said that all he desired was to put his firm right with the building trade.—An independent expert witness, who had examined the two truck loads of bricks, said 20 per cent. of them were rejects. He considered the remaining 80 per cent. a good delivery. He would pass a delivery containing 10 per cent. of rejects.—The jury returned a verdict for the plaintiff. Judgment was reserved.

Waiting for Wages.

At Southend-on-Sea, on March 12th, two labourers sued the Corporation for one hour's money in lieu of notice, and for 1s. 7d. for the time they were kept waiting for the payment of their wages. It appeared that the men were employed to clear away snow, and were ordered to bring in their tools at 11 a.m. and receive their wages. They were not paid until 2.30 p.m. Several cases were brought before the judge, who held that a simple claim for payment for waiting could not succeed, as there was no implied promise to pay at the hour named, and even promise to pay at a given time involved no ground for more than nominal damages in case the promise was not kept, as the labourers might have gone away. It was further held that when the man received his wages he accepted them in satisfaction of any claim for nominal damages. The claim was in some cases amended to the effect that the men were entitled to an hour's notice or an hour's pay. In some of the cases an adjournment was granted in order to give the labourers an opportunity of establishing custom. On the resumption, the judge held that whether a man was entitled to notice was a question of the terms of the contract at the time the engagement was made. He found that in most cases where general labourers were employed, the contract was for so much per hour in order to indicate how much the men were to receive for their work, and in this particular case the men were not engaged hour by hour, but to work until they were stopped. As to the question of custom, the principal evidence on behalf of the plaintiffs was given by builders and contractors of great repute and position, and if the case before him had been a question respecting labourers on large building, engineering, or railway works, he should certainly say that there was a great deal of evidence which went to support the custom alleged, a great many witnesses having given evidence of payment for waiting time. There was, however, a good deal of evidence the other way; but he was not called upon to decide that question, as in this instance the custom was not confined to a definite class of labourer. He must hold that there was not sufficient evidence to establish that such a custom applied to all general labourers, and judgment was therefore for the defendants.

AN ESSAY IN COLOUR ARCHITECTURE. HOUSE IN ADDISON ROAD, KENSINGTON, LONDON. HALSEY RICARDO, F.R.I.B.A., ARCHITECT.

This house is remarkable as being an original essay in colour architecture. Glazed material is used throughout, both inside and outside, the colour scheme being daringly vigorous. The basement storey is faced with blue-grey semi-vitrified Staffordshire bricks. The upper portion has a framework of Carrara ware filled in with glazed brickwork—the lower panels of a soft dark-green colour and the upper panels a bright blue. The roofs are covered with green Spanish tiles. The lead rainwater heads are picked out in red, green and gold. The top illustration is a general view from Addison Road; the lower one a view from the garden, and shows the open-air breakfast-room on the right.

Enquiries Answered.

spondents are particularly requested to be as brief as possible. The querist's name and address must always be given not necessarily for publication.

Editor is willing to answer enquiries from readers who require information on architectural, constructional, or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The Editor, will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned, but the enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies, or negligences which may occur.

urers whose questions involve possible legal proceedings are strongly urged to consul their solicitors before taking definite steps in regard thereto.

ers by post will be sent if the enquiry is accompanied by a postal order for 1s., made payable to Technical Journals, Ltd. and crossed, and stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable, and it must be understood that both question and reply will, as a rule, be published in these columns.

Buildings to Measure near Horsham.

TESTIMONY" (Horsham) writes: "Could give me an account of any buildings th measuring or sketching near Horsham articularly a window or doorway suitable a R.I.B.A. Intermediate Testimony of dy?"

-Horsham is not situated in the most nitecturally fruitful district of Sussex, and fine church has suffered much from oration and enlargement. The nave, ade, and clerestory are Early-English, and e are a few good tombs Crawley Church Decorated and Perpendicular work, but obably the most suitable church near by n which details might be measured for the rmediate examination is Ardingly. This nainly of Decorated date, and has good ilinear windows. There is a low-side dow and a priests' door, a perpendicular screen and tomb (1457) and two other bs and Decorated canopies. Rudgwick rch has geometrical tracery windows, a le sedilia, and fine piscina. Most of the ages contain something sketchable; either icturesque group of cottages, a chimney k, or a church tower with shingled broach e. There is a fine timberhouse (restored not spoilt) at East Mascalls. G.

The Order of a Cap.

B. (NORWICH) writes: "Can you tell me er what order of architecture this cap reproduced] would come? There has n a stone porch erected in Norwich, the caps are worked as above sketch. uppose it must be fairly correct, as the nitects are a London firm, and the onry was carried out under the instruc- and setting out of a Norwich technical ructor of masonry."

-Your sketch appears incorrect, but the tal is quite probably that of the ordinary nan Doric order, in which the whole of abacus should be square and not merely cyma and fillet. G.

eement with Regard to a Plot of Ground

. J. D. (PLYMOUTH) writes: "I bought a of ground, a portion of which was sub- to an agreement drawn up by the ad- ing villa owner, as between himself and predecessor. This agreement prevents from building or erecting anything on portion. The plot was divided from the ining property by a wooden paling fence, ch had quite recently been repaired at adjoining owner's wish by the owner of plot to keep cattle off his land. I removed fence, and to his knowledge proceeded to d a hedge, with which he (adjoining er) was well pleased, although I en- ched four inches on his land (1) Can I e him pay a portion of the expense of the hedge? (2) Has he violated the agreement by his sanction to have the hedge built, coupled with his words in a recent letter to me, saying, 'When I permitted you to build a hedge in place of a fence'? (3) Does not this make void this entire agreement? (4) He has fixed in the centre of my hedge a wire fence, quite 2ft. beyond the line of the old fence, on my rights. If he sets a claim in any way, can I compel him to pay for part of the hedge?"

—As to (1) it is difficult to see upon what principle the adjoining owner could be made to pay any share of the cost of putting up the hedge. Presumably he would have been quite pleased with the fence as it stood, and mere acquiescence cannot make him liable. As to (2), see answer to (1). The fact that the adjoining owner sanctioned the pulling down of the fence and the erection of the hedge would probably estop him from complaining of the action of our correspondent. Otherwise it is clear that the adjoining owner might have maintained an action for trespass (see *Voyce v. Voyce*, Gow. 201; *Martyn v. Knollys*, 8 T.R. 145). As to (3), see answers to (1) and (2). The mere fact that the adjoining owner has permitted the fence to be pulled down and the hedge put up does not invalidate the agreement made with our correspondent's predecessor. Thus the adjoining owner could always enforce it so as to prevent the erection of a house or building on the land. As to (4), it is not stated when the wire fence was put up. If it was put up *before* the hedge was planted, and our correspondent made no protest, it is difficult to see how he can complain. But of course it is a technical trespass to place wires on a man's land without his consent (*Finchley Electric Light Co. v. Finchley U.D.C.* (1903) 1 Ch. 437), and if our correspondent can show there was a violation of his rights he would be entitled to bring an action. Generally, upon the whole case, the facts (so far as they are stated) lead us to the conclusion that our correspondent would be well advised to let well alone. There is no such grievance here as would justify the commencement of expensive legal proceedings.

B.

Repairs to a Conservatory.

W. M., PECKHAM BUSH, writes: "My services were called in two years ago last December to repair a large disused conservatory, which was badly damaged by a gale, and was leaning 7in. out of vertical in 7ft. (to gutter). I got this in position, and repaired the woodwork and glazing. When finished, my client asked for my account twice. Before attempting to pay, however, another gale removed some more glass at another part of the roof. He expected me to repair this further damage for the same account. I objected, as the whole structure was in a decayed condition. He then called in a surveyor, who valued the work at a sum less than my account. I offered to have the work valued by my own

COLOURED MATERIALS IN BUILDING: THE WEST FRONT OF ORVIETO CATHEDRAL.

surveyor, but the other gentleman refused, because my surveyor is not in the "*Association.*" (1) Am I bound to accept *his surveyor's price*? (2) If summoned for the amount, would the judge have power to appoint an impartial man? (3) Can I obtain legal assistance from any association connected with the trade?"

—Much depends upon the terms of the original order to repair the structure; but it appears that if our correspondent had completed the repairs properly in the first instance, he cannot now be made responsible for the damage caused by the second gale. That is the legal position of the matter.

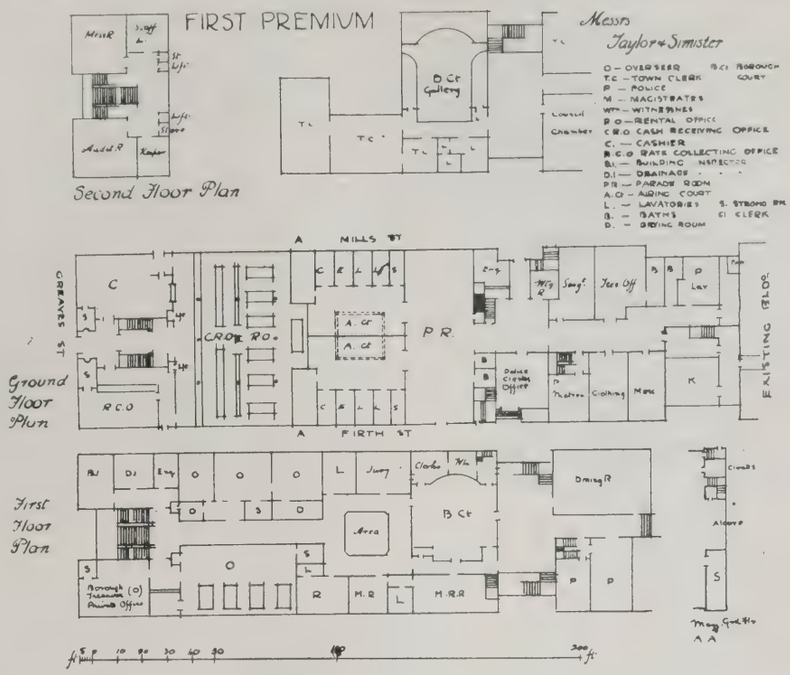
With regard to (1), it is clear that our correspondent is *not* bound by the price as fixed by the other surveyor. If the "client's" surveyor refuses to meet the man chosen by our correspondent, the whole arrangement falls to the ground, and the parties are relegated to their legal rights. That being so, there would be nothing to prevent our correspondent from going to law. The action might be commenced in the County Court, and then it is probable that the lawyers could agree upon an independent arbitrator. Even if they do not agree, the judge has power (under s. 104 of the County Courts Act, 1888) to refer the matter to an expert, with the consent of the parties. If the matter can be settled without going to law, so much the better; for litigation—especially when it ends up in a reference of the matters in dispute to an arbitrator—is a costly business.

B.

Books for Small House Work.—"REX" (BERKDALE) writes: "I should be obliged if you would inform me of a book or two likely to be useful in giving the probable cost of certain materials, work, etc., when designing or detailing buildings. The books should advise how to build a cottage artistically, yet cheaply. Can you recommend any book that would be useful to an architect about to touch speculative house work, giving particulars of cost of drains and mains, etc., also how to arrange a mortgage for a plot and all incidental expenses?"

—I think the best book that he could have for his purpose would be Rea's "How to Estimate." He would also find Stephenson's and Fletcher's books very useful.

B. T



OLDHAM TOWN HALL EXTENSION.

The proposed extension to Oldham Town Hall is intended to be an addition to the existing central block, and was consequently required in the conditions to harmonise with the latter in style and general characteristics, so as to present, as far as possible, a homogeneous whole. The levels of the floors were to correspond, and convenient means of access were to be arranged, on each floor, from the present corridors in the Town Hall. The site to be covered is on the south side of the present building, bounded by Greaves Street, Firth Street, and Mill Street, and has a steep slope. The completed group will thus stand on an island site, the lowest point of which is in Greaves Street.

The principal elevations—in stone—were to be toward Greaves Street and Firth Street. The elevation to Mill Street, a very narrow thoroughfare, was to be executed in white glazed brickwork, similar to the existing facing on that side of the Town Hall.

The sum to be expended on the building was not to exceed £25,000. This, whilst including the cost of drainage, water supply, lighting, heating, ventilation and fixtures, was not intended to be taken as including architect's commission, clerk of work's salary, furniture, fittings, and final decoration.

The first premiated design is the work of Messrs. Taylor and Simister, Queen Street, Oldham, who have obtained a direct and uncomplicated solution of the problem. The disposition of the rooms grouped round the main entrance (in Greaves Street) is particularly good—the one entrance serving for both cash receiving and rate collecting offices, although in the case of the latter a separate

OLDHAM TOWN HALL EXTENSION: SKETCH PLANS OF SECOND PREMIATED DESIGN. WINDER AND TAYLOR, ARCHITECTS.

SECOND PREMIUM

MESSRS WINDER & TAYLOR

OLDHAM TOWN HALL EXTENSION: SKETCH PLANS OF FIRST PREMIATED DESIGN BY TAYLOR AND SIMISTER.

entrance is also provided. In many of the schemes submitted, several entrances are provided, yet the cashier's office can only be gained by traversing other rooms. The rearrangement of the rooms adjoining the Borough Court is also highly satisfactory. The position of the staff mess room would, however, we think, bear reconsideration—its isolation on the top floor and in a remote corner of the building is hardly desirable.

In the disposition of the prison cells it will be noted that the airing-yard is subdivided so that the women have one half and the men the other. There is, however, no direct entrance to the cells from the street, such as is provided in the schemes placed second and third.

With regard to the elevations, we do not like either the general modelling of the façades, or conventional profusion of keystones, distorted pediments, etc.

In the second premiated design, that by Messrs. Winder and Taylor, Union Street, Oldham, an attempt has been made to harmonize the new block with the old. The latter, whilst badly planned internally, is inoffensive in appearance, if dull in the detail. We could have wished Messrs. Winder and Taylor had contented themselves with a more faithful following of the original. It will be observed that the part to Greaves Street is not squared on in the first design, and the gain in space thus obtained appears to us not to be worth the unpleasant appearance of an acute angle at the corner. The planning of the rooms adjacent to the Borough Court and the lighting of the parade room would bear revision. The entrance to the cells, however, is certainly good, a drive straight through being obtained. We must also commend the way in which the cells themselves are entered off a corridor at the back and not off the exercise yard. But everywhere the entrances seem insignificant.

Messrs. Jenkins, Matley, and Mills, Queen Street, Oldham, the authors of the third premiated design, have placed their staircase in one corner of the Greaves Street façade, which results in rather awkward communication being obtained on the first floor. The arrangement of the borough treasurer's rooms on the Greaves Street façade has a lack of balance, and the drive-through for prison vans across the exercise yard on to which the

cells face is not all that could be desired. In short, whilst the disposition of the rooms round the borough court is quite good, the plan could be improved in its smaller details.

Amongst the other designs submitted that deserve mention, the first, by C. T. Taylor, is remarkable for its well-thought-out façades, slightly neo-Grec in character and carefully drawn. We may be permitted to doubt, perhaps, whether Mr. Taylor's elevation to Firth Street could quite stand the three features given to it.

The second is the work of Mr. T. J. Hall, in the general lines of whose design there is a commendable restraint.

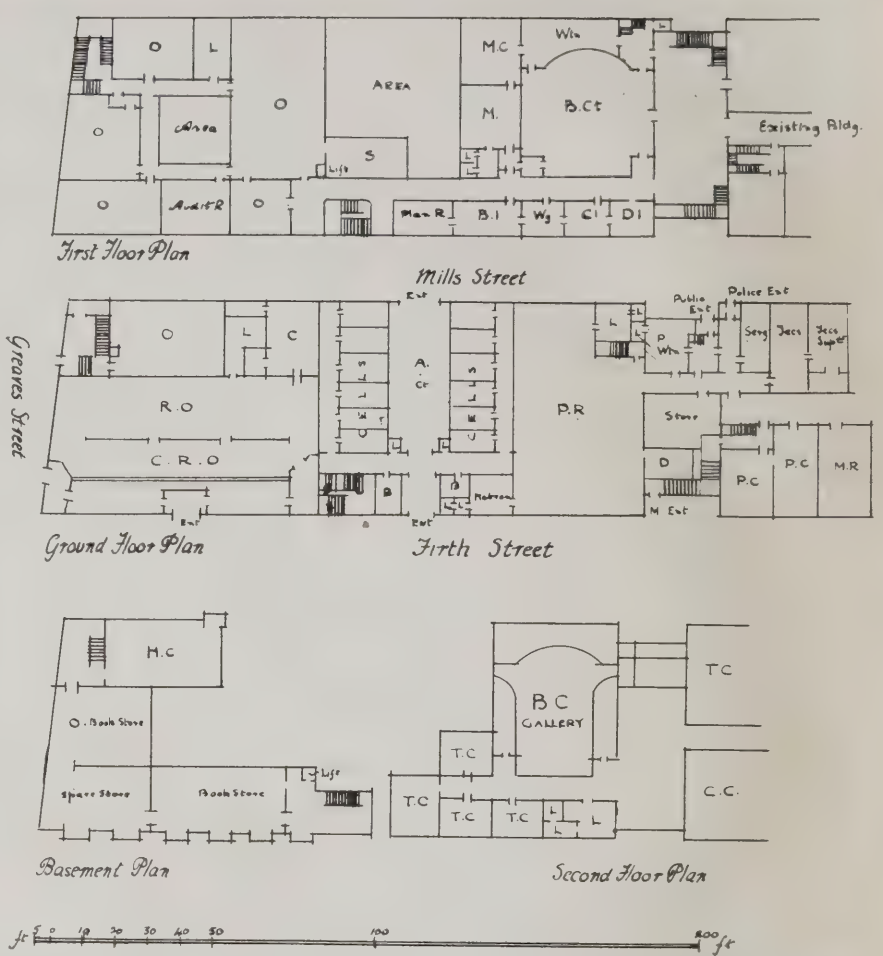
In no design submitted did we see the faintest trace of any French or American influence in the planning.

The assessor was Mr. G. H. Willoughby, F.R.I.B.A.

Societies' Reports.

Leeds School of Art.

Before the students of the Leeds School of Art last Wednesday Mr. Butler Wilson gave his fourth and concluding lecture on "The Arts in England at the Close of the Seventeenth Century," his subject being "Interior Decoration and Furniture."Mr. John Proctor presided. The lecturer, after referring to the interior decoration and furniture of English homes during the reigns of Charles II., James II., and William and Mary, 1660-1700, said that the evolution of the English traditions with the marked influence of France, Holland, Italy, Spain, and Portugal, was traced in the wall panelling, doors, chimney pieces, and tapestries, together with the innumerable variety of pieces of furniture which, during this period, in many cases were produced for the first time in England. The relationship between Louis XIV. and Charles I., with the presence at the English Court of Louise de Kerouaille, was given as the reason for the great advance in luxury amongst the English nobles. Mdle. de Kerouaille, or Madame Carwell, created Duchess of Portsmouth, drew from the Treasury in 1687, a sum of £136,000, her regular pension being £12,000. Evelyn, in his diary, recorded that in 1675, "I was casually showed the Dutchesse of Portsmouth's splendid apartment at Whitehall, luxuriously furnished, worth ten times the richness and glory beyond the Queene's, such massey pieces of plate, whole tables and stands of incredible value." The lecture was illustrated by specimens of furniture of the period from the collections of Mr. Butler Wilson and Mr. Haywood Ryder (headmaster of the School of Art).



Junior Institution of Engineers.

A combined meeting of this Institution and of the Architectural Association Debating Society recently took place at the rooms of the Architectural Association, Tufton Street, Westminster, for the consideration of the subject of "Town Planning," the architect's point of view being represented in a paper by Mr. Stanley Hamp, and the engineer's in one by Mr. Frank R. Durham. The importance of comprehensive and orderly planning and the necessity of provision for development was urged by Mr. Hamp, in illustration of which reference was made to Paris, Germany, and America. The limitation of town areas, open spaces, and grouping of buildings were dealt with, and the difficulties due to various circumstances in regard to the character and height of buildings to be erected were touched upon, the value of forecourts in any scheme, and the position of public buildings, traffic problems, etc., were discussed. Mr. Durham showed how essential it was that the architect and engineer should co-operate, and made reference to the pioneer and later work in Germany, Austria, etc., carried out by Mr. W. Lindley, including the rebuilding of the city of Hamburg. The æsthetic, hygenic, social, and economical principles involved in the question were reviewed, and the author showed that the sewerage system was a determining factor in designing main arteries. The survey of the ground, width of streets, position of sewer, water and other pipes, engineering, considerations due to traffic, planning and class of buildings, and depths of plots were dwelt upon, the Housing and Town Planning Act, of course, receiving notice.

A discussion followed the reading of the papers, and a vote of thanks to the authors brought the proceedings to a close.

Royal Photographic Society.

A meeting was held recently at the Society's premises, 35, Russell Square, W.C., to discuss the formation of a federation of Photographic Survey and Record Societies. Mr. J. C. S. Mummery, who presided, said he belonged to a profession which constantly brought him in touch with the vanishing works of man—old buildings, old streets, and all sorts of ancient things. They were disappearing so fast that there seemed to be no one available to capture the likenesses for the people who were to come after them. Photography was an absolute and perfect recorder, and yet little opportunity had been taken of its powers. There were little societies here and there, but if they could be brought into touch with other people enthusiasm might be stirred up. There was also a fountain which had not been tapped—professional photographers throughout the country, whose thousands of accumulated negatives might be purchased or brought into use. The federation would arrange that collections should be transferred to places of safety, and it would be able to photograph existing records in other people's possession. A resolution, "That it is desirable that a federation of photographic survey and record societies should be formed," was carried unanimously.

OLDHAM TOWN HALL EXTENSION: SKETCH PLANS OF THIRD PREMIATED DESIGN. JENKINS, MATLEY, AND MILLS, ARCHITECTS.

Obituary.

Mr. James Armitage, builder and contractor, of Southwick-on-Wear, has died at the advanced age of 82.

Mr. Richard Bowen, one of the principal builders and contractors at Leamington Spa, who has died after a brief illness, was seventy years of age. He began business at Leamington in 1873, and amongst the important buildings erected by him may be mentioned the Leamington Free Library and Technical School. Mr. Bowen had been a member of the local association of master builders since its formation, and he took a keen interest in the management of its affairs.

Mr. Reuben Castle, F.R.I.B.A., of Cleckheaton, at the age of 63, was the the son of the late John Castle, of Batley Carr, and as a young man emigrated with the family to Philadelphia where his father died. Mr. Castle then returned to Yorkshire, and was articled to Mr. Samuel Overend, of Dewsbury and Cleckheaton. On the completion of his articles he commenced practice on his own account at Cleckheaton in 1872, and continued there until his death. A few years ago his son, Mr. J. G. Castle, joined him as partner.

Mr. Charles Lomax, head of the firm of Charles Lomax, Ltd., contractors, of Ramsbottom. The deceased, who was 67 years of age, was a member of the Bury and District Building Trades Employers' Association, which was represented at the funeral by Messrs. John Inman, James Fletcher, J. W. Hall, Howard. J. Hopkinson, Robert Shilton, John Castle, and others.

ARCHITECTURAL SCHOOLS IN THE UNITED STATES.

I.—THE SCHOOL IN MASSACHUSETTS INSTITUTE OF TECHNOLOGY, BOSTON.

By J. A. O. ALLAN, A.R.I.B.A.

[In a lecture by Professor C. H. Reilly delivered at Liverpool recently on "Some Lessons in America," he says this school is the greatest outside Paris, and that it still exerts the most vital influence over a whole Continent. This short exposition of its curriculum and aims by Mr. Allan (who has been touring, as Godwin Bursar of 1910, for the purpose of studying educational buildings in America and reporting thereon to the R.I.B.A.) will be of special interest. The question of Architectural Education in this country, in view of our comparative failures in the design of big buildings, is one of paramount importance.]

Constitution.

The "M.I.T." (its colloquial title) was the first Technical College in the States to institute a regular course in architecture. It was opened in 1866, its first professor and director being William Ware, a pupil of the late Richard M. Hunt. The organisation and methods were modelled on those of the Ecole des Beaux-Arts at Paris. Mr. Létang came from Paris to become instructor in design, and his talents gave the school a reputation which it has maintained ever since. M. Despradelle, a Grand Prix de Rome student, is now Professor of Design, and his work with that of his colleagues keeps the school in the front rank. The whole department is under the charge of Professor F. W. Chandler.

The staff includes four professors—the Professor in charge, with his assistant Professor, the Professor of Design, and an assistant Professor of Architectural Engineering—all fully engaged in the work. There are also ten lecturers or special teachers of such subjects as modelling, water colour work, drawing, etc., while the professors (to the number of fourteen) of other related subjects in the institute, such as mechanics, chemistry, and various branches of engineering, give instruction in various parts of the architectural course.

The fees for regular students taking the full course are about £50 per annum. Anyone may, however, attend any of the classes by simply paying the ordinary fee. The number of students in regular attendance is about 140 at the present time.

Entrance to the school is only to be had after passing a fairly stiff examination in English literature, two modern languages, history (especially of the United States and of Greece and Rome), mathematics, physics, and a number of other optional subjects.

Details of the Course.

The general subjects mentioned above in the entrance examination are also continued during the first three years of the course, ending in the fourth year with a study of European civilisation and art, which includes an extended survey of political, ecclesiastical, and social history, quite as necessary as architectural history itself if the spirit of classic, Gothic, and Renaissance Art is to be understood.

The course is a four-year one. The first year is devoted mainly to technical and general subjects. Professional work begins with freehand drawing, which is continued throughout the course. Students have individual instruction in working from the cast of the antique and of architectural detail, and from life. The drawing exercises are supplemented by lectures on art, anatomy, and memory drawing. In the last year decorative figure design is studied in association with architecture. The courses in freehand drawing are supplemented by lessons on drawing in pencil, pen and ink, and water colour. In all these mediums the instruction is given with a view to good rendering of architecture, but as students progress opportunity is given for outdoor sketching, and during the summer vacations they are expected to make sketches to present for criticism at the opening of the next term. Instruction is given in modelling, with the purpose of teaching the student the value of the third dimension, and its importance in architectural design. He is taught the manipulation of clay and its practical use in modelling as an aid in design.

In the second year, design and the history of ancient architecture are taken up simultaneously. Classic work is taken as the starting point, being the origin of all the great styles which developed in after years. These subjects are treated so as to unfold the fundamental principles of architecture, and train the student to analyse the best examples of classic work, and study their elements, in order to cultivate his taste and sense of proportion, and to give him a sound and logical sense of balance, scale, light, shade, and colour. Lectures are given on the proportions and use of the Greek, Roman, and Renaissance Orders, arcades, windows, and other architectural details. A course in Shades and Shadows is given concurrently with that relating to the Orders, so as to teach the value of light and shade in architectural composition.

Lectures are also given on architectural design at frequent intervals by instructors who are actively engaged in the profession, so as to avoid the danger of the work running into an academic groove, and to remind the students that architecture is a living and progressive art.

The study of design is made by means of problems regularly set, the results being criticised before the classes. The subjects assigned to each class vary from sketch problems to be designed and rendered in one day "en loge" to those to be finished in a week, and the more elaborate problems to which a month or more may be allowed.

Professor Chandler says, that in order to accustom the students to concentrate their minds on the development of a single idea, instead of wasting their energies in the successive adoption and abandonment of different solutions of the given problems, two days are allowed after the posting of the larger problem of the month, within which time each student must fix upon some general scheme for his design, and show his idea by sketch, plan, and elevation to a small scale. The purpose of this is to teach the student to formulate his ideas quickly and definitely, and to compel him to adopt some definite solution at once in order that he may hope to complete his problem in the necessarily limited time assigned to it.

These preliminary sketches are ultimately attached to the completed designs, which must correspond with them in the essentials. The sketches are criticised before the class. regular individual criticism is given the student while working up his scheme to the finished design. and at the conclusion of each problem every design is subjected to a final criticism before all the students, and compared with the preliminary sketch.

From a Sketch by D. C. Leigh.

In the course of the History of Architecture, the aim is to enable the student to see that the styles simply represent certain epochs in the progress of the art; that they developed naturally and logically in harmony with their varied conditions; that down all the ages construction has been the basis of all good architecture; that the relationship between those periods in the history of architecture is so intimate that none of them can be ignored if the student is to have an intelligent understanding of the architecture of the past, and its proper influence on the architecture of to-day. This history is taught by lectures, fully illustrated by lantern, photographs, and books. The resources of the school for instruction in this department of the work may be judged when it is mentioned that the library contains almost 4,000 books on architecture, 16,000 photographs, and 15,000 lantern slides. Each week the students are required to present for criticism abstracts with sketches of the historical buildings discussed. They are also required to test, by comparison with accurate drawings and photographs of the buildings, the descriptions and views of the leading architectural authorities, and to prepare these and sketches showing the results of their research. To supplement the work of the classroom, sets of photographs, properly

labelled for study, are exhibited in the architectural library, the collection being changed from time to time to keep pace with the work of the classes.

Instruction in Ornament explains its historical development, and the student is taught the general treatment of colour in decoration, as well as the characteristics of different styles. Problems are designed and rendered in colour, and when finished are criticised before the class.

Scientific construction is daily becoming of greater importance in the practice of the modern architect, who must be not only a skilled artist, but be capable of dealing with the many serious structural problems which the buildings of to-day have created. Unless the architect be a constructor (the primary meaning of the word) he will sink into a mere decorator, and when architecture has become mere decoration, it is a dead thing. Architecture is not simply an accessory of construction. Architecture is neither decoration nor ornament, nor even "beauty in building." It is something deeper than ornament and more subtle than decoration. It is the fine art of building according to the principles of truth, fitness, and beauty. All these may be built into its stones, though there be not one scrap of ornament on it.

As constructor, the architect considers the practical requirements of the buildings which he designs. He deals with the structural conditions of the problems he has to solve; he studies many different materials, calculates their weights and strengths, determines their forms and sizes, and orders all these, stone and brick, lime and cement, iron and steel, lead and copper, wood and glass and slate, and many more, into such relation to each other that a building, solid and convenient, comes into being. As artist, however, the architect invents such combinations of lines and forms, solids and voids, lights and shadows, as express in a fitting way the purpose and character of the building, whether homelike and unpretending, dignified and austere, sublime and majestic, or shaped into graceful beauty with a lighter hand.

In order to secure the true and appropriate treatment, scientific and æsthetic, of the materials at his disposal, the architect must know them thoroughly, and in all their combinations. In America, the rapid advance in the height of buildings, and the many difficulties raised by the weight of such high buildings as the skyscrapers, the great wind pressures to which they are frequently exposed, their protection from fire, their sanitation, and their heating and ventilating arrangements, crowded into the smallest space for the sake of the all-devouring dollar, constitute a series of structural problems which require the greatest skill for their successful solution. During the last year of the course instruction in Advanced Constructive Design is given, which can, however, even at the best, only lay a good foundation on which the architect may build out of his own study, research, and experience.

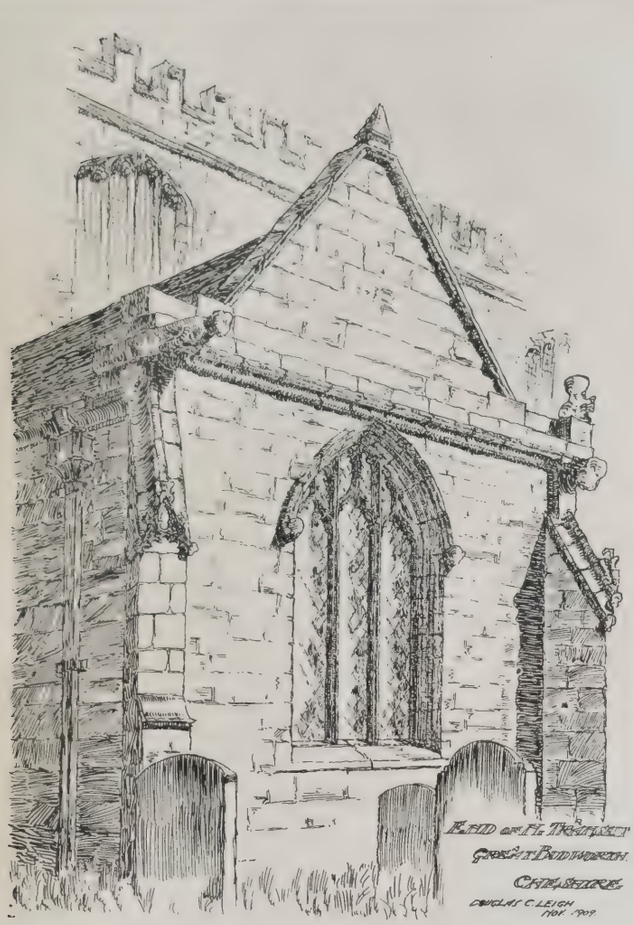
From a Sketch by D. C. Leigh.

Other studies towards the close of the four years include instruction in the preparation of working drawings and specifications, such details as may be better learned by practical experience in an architect's office being omitted. Building materials are studied, and tested in the laboratories. Stones are dealt with from their geological position to the many practical considerations involved by their structure and composition, their strength and powers of weathering. The fundamental principles of heating and ventilation are taught, and also the proper application of these principles to practice in the solution of problems in this department of building engineering.

From a Sketch by D. C. Leigh.

The Summer School.

A summer school is held, whenever a class is large enough to warrant it, for the purpose of bringing the students directly into contact with buildings, ancient and modern. For this purpose, visits are made to localities where buildings of importance are to be found. These schools have not only visited various American cities, but have crossed to England, France and Italy. Measured drawings and sketches are made on the spot, and careful studies made of the buildings included in the tour.



Degrees and Prizes.

To obtain the degree S.B. (Bachelor of Science) in the architectural school the student must have completed all the prescribed studies of the four years' course, and have submitted, at the close, an original thesis design accompanied by an explanatory memoir.

In addition to the general studies already mentioned, degree students are required to complete a prescribed course of reading of a non-professional character during the summer vacations following the first and second years, the purpose of the general course is to increase the acquaintance of the student with literature, history and general science, to develop in him a taste for reading and literature and to impress him with the importance of general culture.

The master's degree can be obtained only by graduates in the bachelor's degree. To attain it candidates must pursue their course of studies continuously, under the direction and oversight of the Faculty, for at least one full school year beyond the ordinary course. The student must pass with credit the prescribed examinations, and present a thesis for approval before receiving the degree.

There are several valuable prizes for undergraduates at the different stages of their studies, and travelling scholarships for graduates awarded solely for distinguished merit.

From a Sketch by D. C. Leigh.

In Parliament.

(By our Press Gallery Representative.)

The Committee on Public School Buildings.

In the House of Commons on 9th inst., Sir John Rolleston asked the President of the Board of Education, whether, in regard to the departmental committee lately appointed to inquire into the cost of public buildings for schools, etc., he would consider the advisability of adding to that committee the names of one member of the council of the British Architects' Institution, one member of the council of the Surveyors' Institution, and one member of the council of the Institution of Civil Engineers.

Mr. Runciman, in reply, said: I purposely restricted the membership of the committee in order that it might be able to report quickly. It is not intended to be a committee of experts who could authoritatively recommend particular materials or methods of construction for adoption by local education authorities.

The practical question which lies behind their reference is whether the Board of Education can properly modify their building regulations and entertain or encourage proposals from the local education authorities who are primarily responsible for school buildings for the adoption of new materials and methods, and, if that question is decided in the affirmative, what further arrangements are necessary to give effect to the decision. I think a small committee of administrative officers collecting the best expert opinion on the subject, which I hope will be placed at their disposal by the great bodies named in the question, is the best body to deal with the matter from the point of view which I have indicated.

Labour Exchange Buildings.

Mr. Bottomley asked the First Commissioner of Works if he could state how much of the £70,000 voted as a Supplementary Estimate for the accommodation of the Labour Exchanges had so far been expended; and whether it was proposed to suspend expenditure upon permanent buildings pending an opportunity for ascertaining the utility of such exchanges.

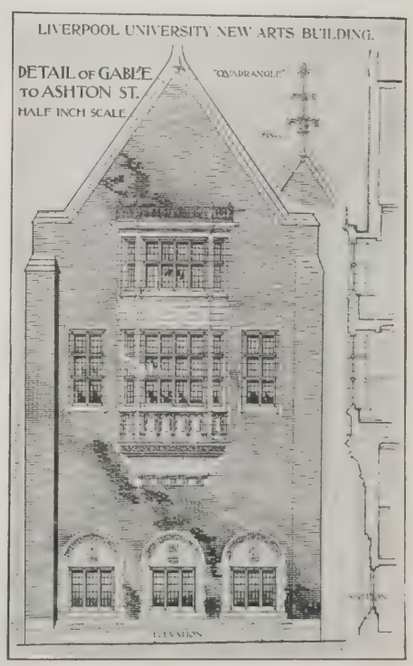
Mr. Harcourt said his Department was practically committed to the expenditure of the full sum of £70,000 provided by the Supplementary Estimate for the accommodation of Labour Exchanges during the current financial year, though some small surplus might have to be surrendered in respect of accounts which might be outstanding on the 31st of March next. The Board of Trade was empowered by the Labour Exchanges Act to establish and maintain Labour Exchanges in such places as they thought fit, and he would be prepared to comply with the lawful requirements of that Department.

Rosyth Garden City.

The Lord Advocate, answering a question by Mr. Ponsonby said: I understand that the Admiralty are proposing that a certain area of their property at Rosyth should be developed on Garden City lines. A conference has been held between representatives of the Admiralty and the Scottish Local Government Board in order that the Admiralty may be advised as to the best means by which the scheme can be carried out.

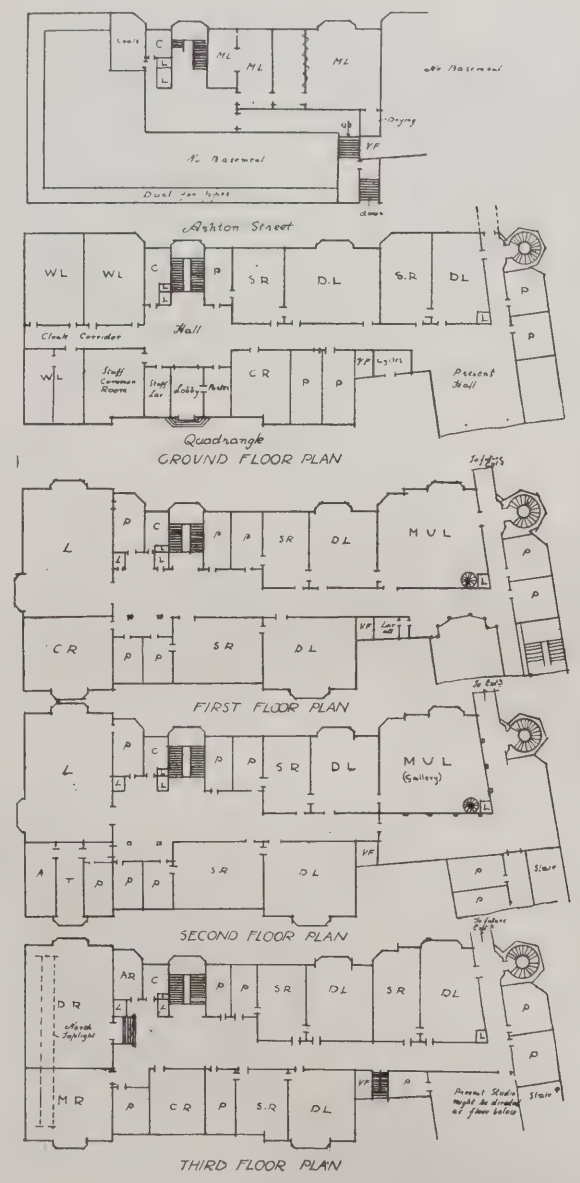
Duke of York's School Chapel.

The second reading of the bill to permit the destruction of this building and to deal with its site was moved by Mr. Lewis Harcourt on the 17th inst. After considerable opposition the debate was adjourned.



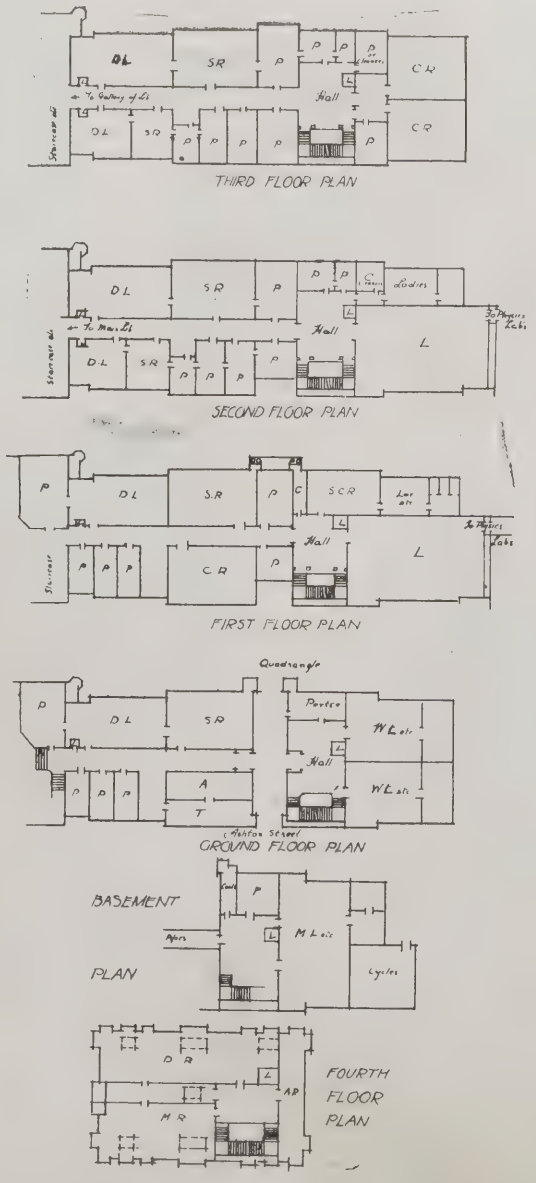
UNIVERSITY OF LIVERPOOL: NEW ARTS BUILDING.

The committee, appointed by the Council of the University, invited designs from Messrs. Briggs, Wolstenholme and Thornely, Mr. J. T. Doyle, Mr. F. W. Simon, and Messrs. Willink and Thicknesse, for an extension of the existing Victoria Building, to be used in conjunction with the latter to house the Faculty of Arts.



The new building was to have a frontage to Ashton Street and another to the quadrangle, with a possible third towards the Physics Building; though, as it was required to provide a carriage entrance, with gates, from Ashton Street to the quadrangle, it was left to the discretion of competitors either to leave a space of 30ft. for this entrance between the new building and the Physics Building, or to carry the former along the whole of the Ashton Street frontage of the site and make the entrance in the form of an archway through the new building. This latter arrangement would involve blocking the south windows of the Physics Building, which would then require to be in communication on one floor at least with the new building.

With regard to the actual construction, it was to be assumed that a good rock foundation could be obtained at an average depth of 4ft. 6in. below the ground surface. The whole structure was to be built of fire-resisting material up to but excluding the roof, and was to be designed to withstand the stresses of quickly moving crowds. The internal walls and floors were to be soundproof.



It was required that the new building should be so arranged as to render possible a reconstruction of that part of the Victoria Building which extends from the corner of Ashton Street to the junction with the new building whereby the headquarters of the University Library would ultimately be placed at this point, and the principal departments of the Faculty of Arts would radiate from it. The plans submitted were to indicate the way in which the architect would propose to effect this future change. It was advisable consequently (1) that there should be free communication with the Victoria Building on every floor; (2) that the

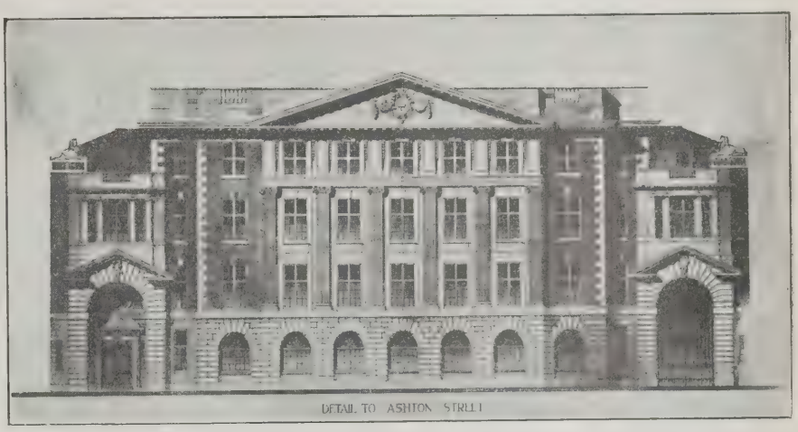
UNIVERSITY OF LIVERPOOL: NEW ARTS BUILDING COMPETITION.

PREMIATED DESIGN SUBMITTED BY BRIGGS, WOLSTENHOLME, AND THORNELY.



floor levels of the two buildings should be the same, and (3) that the rooms on each floor of the new building should be so planned as to provide one or two "departmental suites," each consisting of the following rooms, arranged in this order: (a) A departmental library in as close relation as possible with the future headquarters of the University Library; (b) one or more class-rooms communicating with the departmental library; (c) two or more private rooms for lectures and research students; (d) a lecture-room which should be on each floor at the end of the building next to the Physics Laboratory.

The total sum to be expended was £25,000, a premium of £150 being allowed to the author or authors of the designs placed first by the assessor, and £50 each to the authors of those placed second, third, and fourth.

Mr. Guy Dawber, as assessor, awarded the first premium to the design submitted by Messrs. Briggs, Wolstenholme, and Thornely ("Quadrangle"), and though we can have no hesitation in expressing our admiration of the exceedingly workable and practical plan which they have evolved, we find the elevation rather disappointing. The façades are conceived in a brick and terra-cotta Gothic that was scarcely to be anticipated from the authors of the Liverpool "free-Renaissance" Dock Board offices. Messrs. Briggs, Wolstenholme, and Thornely seem to have been influenced by the somewhat vaguely-worded clause in the conditions which suggests that the new building should harmonize externally as far as possible with the Victoria Building on the one hand, and the Physics Building on the other—though this same clause expressly stated that there was no intention of imposing upon competitors a continuation of the late Mr. Waterhouse's internal and external detail or of restricting the choice of style or material. The suggestion, we presume, was simply intended to secure preservation of scale and tone. As will be seen from our reproductions of the elevations, Messrs. Briggs, Wolstenholme, and Thornely's interpretation of the clause was quite different. Whether they were justified in this is, of course, purely a matter of artistic opinion.

The mediæval character of the elevations is maintained consistently in the plan throughout, the symmetry of the front toward Ashton Street being only apparent, as it would inevitably be destroyed in the formation of the future quadrangle on that side. Though a general disregard for balance is frequently considered to conduce to convenient planning, we cannot but regret what we ourselves regard as the unfortunate absence of axial disposition in this plan. A haphazard grouping of rooms, however convenient, cannot produce architecture; and conscious picturesqueness is almost "a contradiction in terms." Ill-shaped rooms, even if of the specified area, do not constitute the highest forms of practicability. Moreover, in such an all-important matter as the position of the main staircase, the access obtained leaves something to be desired in point of directness. For example, a person desiring to reach the ground floor seminar class-room from the identical room above, would be forced by whichever descent he chose—either the main staircase of the old Arts building, or the new staircase—to traverse a considerable distance. In other respects, however, the arrangement of the whole shows an intimate knowledge of the requirements and actual working of a University department.

Mr. F. W. Simon submits a design ("Red Seal"), in which it will be seen that a distinctive French influence is evident. An examination of the general disposition of the plans betrays a tendency to extravagance—though a commendably economic remodelling of the Arts Theatre as the main University Library is achieved. It is perhaps to be regretted that the principles involved in axial planning have not been carried through in every case; some of the shapes of the rooms would bear revision. Still, on the whole,

DESIGN SUBMITTED BY F. W. SIMON.

DESIGN SUBMITTED BY WILLINK AND THICKNESSE.

the author has been exceptionally successful in combining architectural planning and satisfactory provision. The barrel-vaulted corridors, sub-divided into compartments, from the centres of which doors open off naturally, form genuinely pleasant features in the general lay-out. The only serious defect in the plan from the point of view of convenience appears to us to be that the position of the new departmental libraries in relation to the remodelled main library is such that all service between the two must be across the landing at the head of the main staircase. The latter, however, is of most graceful shape, and is otherwise very fortunately placed.

Mr. Simon's elevations at once attract the eye as being most pleasantly rendered. The masses are handled with facility, and a certain breadth and scale is well maintained throughout the whole. At the same time, we cannot feel ourselves altogether in sympathy with the introduction of the luscious sculpturesque excrescence in the pediment, the somewhat over-topical and over-large sphinxes ("The Sphinx," it will be recalled, is the University Undergraduates' Magazine) surmounting the end blocks, and with the depth of the main frieze, which has been apparently regarded as possessed of unlimited

elasticity. With these trifling exceptions, we consider the design to be admirable. It has real architectural feeling, and sufficient realisation of the classic spirit to merit its erection as a University building.

In criticising Messrs. Willink and Thicknesse's drawings ("A") we must confess ourselves handicapped to some extent by the opaque nature of the colouring.

In the plan the grouping of the library and seminar rooms next the library seems to us highly satisfactory. It will be seen that Messrs. Willink and Thicknesse have striven to reduce, as far as possible, the width of their building, so that the entrance to the existing Physics Building may not be unduly thrust out of the centre of the old quadrangle. The long, low, tunnel-like carriage entrance from Ashton Street, and the imperfectly-lighted central corridor, seem to call for further consideration. With regard to the elevations, the proportions of the main masses are generally good, and the employment of the Mansard form of roof helps to preserve the coherence of the whole. But we do not understand either the detail or the principles of the minor composition in this design. We must, however, commend the complete scheme for a new quadrangle accompanying it. This differs significantly from the perpetration of the past—comparing more favourably with the existing sporadic distribution of the University buildings, which have been disposed with a fine disregard of the real possibilities of the site.

Mr. Doyle's design ("Arts") is frankly a continuation of the late Mr. Waterhouse's terra-cotta Gothic.

MOYNS PARK, ESSEX: GENERAL VIEW OF THE FRONT.

AN ELIZABETHAN HOUSE.

The Eastern Counties abound in fine examples of old brick houses, erected either by the Flemish immigrants or by English craftsmen who took up the manner of building thus introduced. But it would be difficult to find one which, for simplicity of charm, excels Moyns Park, Essex. As the accompanying illustrations show, there is a quiet breadth of treatment about it which is altogether delightful. Houses of this character, like many of the colleges of Oxford and Cambridge, have a bald appearance when set down on paper in mere elevation; there seems then to be nothing remarkable or especially attractive about them; yet when seen set round with green, the brick and stonework mellowed by exposure, they at once draw our admiration. Possibly some of the attractiveness they unquestionably possess is attributable to sentimental considerations, for, as Ruskin says, the greatest glory of a building is not in its stones, but in its age, "in its lasting witness against men, in its quiet contrast with the transitional character of all things"; and though Moyns Park, like many another house of its kind, has intrinsic architectural merit, no small measure of the total effect is accountable to the hand of Time working through more than three hundred years. The house was erected by a worthy lawyer, Sir Thomas Gent, one of Queen Elizabeth's Barons of the Exchequer; and the property is still in the hands of his descendants. The ancient lords of the manor were the Le Moignes, from whom the derivation of the present title is obvious.

MOYNS PARK, ESSEX: DETAIL OF THE BAYS.

Beautifully wooded grounds surround the house. The old builders commenced their work here in 1580. There was then existing on the site a half-timber and brick house, dating from the early years of the sixteenth century, and it was decided to retain this for use as domestic offices. Accordingly the new building was erected at a right angle in front of it, and so the two remain to this day—the small building of Shakespeare's time, with quaint carving in the gables, and the large building overshadowing it.

A notable feature of the front is the treatment of the great bays, which alternate with the gables, instead of coming below them in the usual way; while other prominent features are the fine brick chimneys.

The walls are of red brick with stone dressings, now grown over with moss and lichen, the beautiful effect of which can only be appreciated when seen.

Over the doorway is carved the coat-of-arms of the Moignes—*or* a cross engrailed sable, a label of three points gules, each point charged with bezants.

Unfortunately the interior of the house has been considerably altered in the course of years, and the present arrangements have no historical interest. The exterior, however, is left in its original state, and part of the old gardens also, and these combine to give us a most delightful impression.

MOYNS PARK, ESSEX: THE OLD BUILDING, EXISTING AT THE TIME THE ELIZABETHAN HOUSE WAS BUILT.

New Buildings.

Proposed.

Benwell (Newcastle-on-Tyne).—It is proposed to considerably enlarge the Parish Hall, at a probable cost of about £2,600. The hall, when completed, will accommodate 400 people, and other enlargements will be carried out, including the building of large classrooms, and a spacious billiard room in the basement. In conjunction with this scheme it is proposed to erect a new church at Scotswood, with accommodation for 600 people. The plans have been prepared by Messrs. Hicks and Charlewood.

Frimley.—It is proposed to erect a chapel at the Brompton Hospital Sanatorium at an estimated cost of £2,000.

Greenock.—In connection with the new Government torpedo factory, which is nearing completion, it is expected that by the beginning of July 400 workers from Woolwich will be sent North. It is proposed to lay out a garden suburb on the English villa principle for the workers and their dependants at Gourock. The building scheme is expected to cost £10,000, and provision will be made for 600 villas.

Knaresborough.—It has been resolved by the Urban District Council to borrow the sum of £3,500 for the purpose of alterations to premises in York Place and Gracious Street for council room and offices.

Lancaster.—A scheme is on foot for restoring the Church of St. Michael, Cockerham, near Lancaster, and Messrs. Austin and Paley have prepared plans which provide for a practically new building except the ancient tower, which is to be retained. The cost is estimated at about £3,900.

London (Camberwell).—Nine blocks of Peabody tenements are shortly to be erected at Camberwell Green—so it is stated in the report of Peabody Governors just issued. A site has been purchased of nearly an acre and a quarter, and plans and specifications have been approved for the erection of buildings, which will comprise, altogether, 420 rooms.

Newcastle.—It is proposed to erect a Queen's Hall, in a central position, near the foot of Northumberland Street, from designs prepared by Messrs. Graham and Hill, architects, Newcastle. A company has been formed with a capital of £50,000 to carry out the scheme.

Pickering.—The proposed new Catholic Church and hall will stand on a site between the new schools and the present chapel. The estimated cost is £3,359, and Mr. Leonard Stokes, F.R.I.B.A., has prepared the plans.

Slough.—The King has given a donation of twenty guineas towards the Parish Church Completion Fund. The east-end of the building, which cost £12,500, has been in use for some years, and it is now proposed to erect the west-end in harmony with the existing portion of the edifice.

Streatham.—A movement is on foot to erect a block of buildings comprising a skating-rink, public hall, and cinematograph, on a site in close proximity to Streatham Hill Railway Station. The buildings will be erected by Messrs. Townson and Sons, Ltd., of London and Bolton, and the exterior will be faced with shops looking upon the Streatham High Road.

Swansea.—At a recent meeting of the Estates Sub-Committee a letter was read from the War Office accepting the terms which provide for the surrender of the present Arsenal site and the erection of a new drill and public hall at a cost of some £12,000 on the same site.

In Progress and Completed.

Bradford.—The Manningham new branch Free Library, in Carlisle Road, has been opened on completion. The new premises, which have cost about £4,000, were designed by the former City Architect (Mr. F. E. P. Edwards), and the work has been continued under the present holder of that office, Mr. R. G. Kirkby.

Castleton.—The new Corporation Baths in Manchester Road have been built by Messrs. Thompson and Brierley of Bury from plans and designs by Messrs. Wallis and Bowden, of London, at a cost of about £8,285.

Leicester.—The new Victoria Road Schools and Institute are in course of erection. The cost, including site, is estimated at £13,000. Mr. Lawton Brown is the architect.

Little Kimble (Aylesbury).—The alterations and additions to Chequers Court, the seat of Mr. Arthur Lee, M.P., have been completed. Mr. Reginald Blomfield, A.R.A., was the architect, and Messrs. Maides and Hamper, of Croydon, were the contractors.

MOYNS PARK, ESSEX: CHIMNEY STACKS.

Norwich.—The scaffolding has been removed from St. John's Catholic Cathedral at Norwich, and it is expected that the edifice will be opened in June next. It has been erected by the Duke of Norfolk.

Royton.—The public baths built at Royton, at a cost of £8,000, have been opened. The gentlemen's swimming bath has a water area of 75ft. by 27ft., capable of holding 57,000 gallons of water. There is accommodation around the bath for about 700 spectators, and the bath can be covered and converted into a hall. Mr. Ernest Woodhouse, F.R.I.B.A., was the architect. The contractors were Messrs. S. and J. Smethurst, Ltd., Rochdale Road, Oldham; stonework by S. and J. Whitehead, Oldham; constructional ironwork by Baxendale Bros., Manchester; plumber's work by R. Chadwick and Sons, Oldham; joiner's work by J. W. Kent, Royton; slating by R. Bamford, Royton; electric bells by R. O'Brian and Co., Manchester; wrought-iron railing by J. Jones and Sons, Manchester; aerating plant by Royles, Ltd., Irlam; tiling by the Marsden Tiles, Ltd., Manchester; engineering by W. Matthews and Son, Princes Street, Manchester.

Stoke.—The new Town Hall, which is in course of erection, will be of fireproof construction throughout, and the cost of the whole scheme will be £25,791. Messrs. Willcock and Co., of Wolverhampton, are the contractors, and the joint architects Messrs. Wallis and Bowden, of Westminster.

Washington.—The new schools have been completed and were recently opened. They are erected near to the main road, and are of brick. The schools will provide accommodation for 360 mixed scholars, and the total cost was £7,660 8s., or £12 15s. 11½d. per head. Mr. F. Rennoldson, of South Shields, was the architect.

Notes on Competitions.

Examination Hall, Royal College of Physicians and Surgeons.

The result of this limited competition, in which seven architects competed, has been announced. Mr. T. E. Collcutt, F.R.I.B.A., was the Assessor. Mr. A. N. Prentice, F.R.I.B.A., Hastings House, Norfolk Street, Strand, was appointed architect. A premium of £100 was awarded to Mr. Henry T. Hare, F.R.I.B.A., 13, Hart Street, Bloomsbury; £75 to Mr. E. T. Hall, F.R.I.B.A., 54, Bedford Square, W.C., and £50 to Mr. John W. Simpson, F.R.I.B.A., 3, Verulam Buildings, Grays Inn.

The Welsh National Museum.

The result of this competition was announced on Friday last. The Council, acting on the report of the assessors, has appointed Messrs. A. Dunbar Smith and Cecil C. Brewer, of 2, Gray's Inn Square, W.C., as architects of the buildings; and has further awarded the following premiums:—

£200 to Mr. T. L. Vesper, 16, Old Square, Lincoln's Inn, W.C.

£150 to Mr. Henry T. Hare, 13, Hart Street, Bloomsbury.

£100 to Messrs. David Milne and J. William Hepburn, 55, Southampton Row, W.C.

The designs are on exhibition at the City Hall, Cardiff, from Monday last until April 2nd.

LIST OF COMPETITIONS OPEN.

Date is that by which designs must be sent in.

MAR. 31. SHEFFIELD ENDCLIFFE PARK CHURCH. Particulars given in our issue of March 16th.

MAR. 31. MUNICIPAL OFFICES, KARACHI. Particulars given in our issue of March 16th.

APRIL 23. COUNTY OFFICES, NAVAN. Particulars given in our issue of March 16th.

JUNE 15. ELEMENTARY SCHOOLS, ACTON. Particulars given in our issue of March 16th.

NO DATE. NEW ELEMENTARY SCHOOL AND ENLARGEMENT OF ANOTHER, COVENTRY. Particulars in our issue of March 16th.

NO DATE. ELEMENTARY SCHOOL, BLOXWICH. Particulars given in our issue of March 16th.

R.I.B.A.—Mr. George Hubbard on "Architecture on the Eastern side of the Adriatic." 8 p.m.

Trade and Craft.

A New Cleansing Agent.

An effective means of cleansing surfaces is at all times welcome, and in the spring-cleaning season is a boon and a blessing. "Jellso" is described as "the new jelly soap for washing everything." It is equally applicable to painted or varnished work, mosaic floors, marble, stonework, wall tiling, leaded glass, or work having a glazed surface, etc., removing oil and grease and other disfigurements, and leaving the surface fresh and clean. No skilled labour is required in the application. All that has to be done is to apply the solution, preferably with a soft brush, allow it to remain for a short time, and then rinse it off with clean water, when it will bring away with it all that it is desired to remove, but nothing else, as the solution does not destroy the painted or other surface, however delicate, but merely removes from it all foreign matter, nor does it injure the hands. An important advantage for painters is that "Jellso" in no way affects the after-treatment of the surfaces to which it is applied. Work that has been washed with this solution will, when repainted, dry perfectly. It is equally applicable to metal-work. All particulars may be obtained from the Jellso Co., 49, Hatton Garden, London, E.C.

Acetylene Installations.

The advantages of acetylene lighting are attractively set forth in a catalogue (C 16), which has just been issued by Imperial Light, Ltd., incorporating the Standard Acetylene Co., Acetylene Engineers and Carbide Merchants, 123, Victoria Street, London, S.W. This catalogue deals exclusively with acetylene installations for country houses, and contains particulars of the firm's machines, with views of some of the houses in which their system has been installed.

Specification for Painting and Varnish.

"A Complete Specification for Painting and Varnishing," for the use of architects and builders in preparing contracts, takes the regulation or authentic form of a specification—with an unessential but delightful difference. It is artistic. The matter is printed in bold and legible type (showing the influence of the "Golden type" beloved of the late William Morris), on art paper (one side only) with wide margins, and the ruling, the marginal headings, and the notes, are printed in red. There are also included some excellent coloured illustrations, showing a country house of beautiful design (of which the plan is so meritorious as to be well deserving of close study), and several charming details. The booklet is to be had from Messrs. Robt. Ingham Clark and Co., Ltd., St. Helen's Place, E.C.

Electrical Installations and Appliances.

Messrs. Simplex Conduits, Ltd., have issued the eleventh annual edition of their catalogue, comprising 374 pages, in which their specialities are classified in sixteen sections, dealing respectively with the Simplex system of steel conduits, the flexible system of electric wiring, switches and fuses, watertight fittings, wires and cables, china accessories, bell material, porcelain insulators, filament lamps, fans and small motors, electric cooking appliances, electric heating and radiators, electric signs, metres, fixtures, and various shades. The catalogue is illustrated copiously and well.

The plumbing, sanitary, and cast leadwork at the Lancaster Town Hall, illustrated in our last week's issue, were executed by Messrs. Wm. Griffiths and Sons (Liverpool), Ltd.

* * *

"The largest lift contract ever placed with a firm in England for the equipment of one building" is claimed by Messrs. R. Waygood and Co., Ltd., Falmouth Road, London, S.E., with respect to the installation at the large new building that has been erected for the Royal Liver Friendly Society at Liverpool. In the centre of the building, there will be a "battery" of ten lifts, six of which will be express lifts, moving at a speed of 400ft. per minute, while at the pierhead entrance there are four similar lifts, with another at a private entrance.

* * *

Messrs. Ben Henry Johnson and Sons, 69, Victoria Street, Westminster, S.W. (also at Liverpool and Johannesburg), plain and decorative plasterers, decorators and architectural modellers, give notice that the partnership formerly subsisting between Mr. George Henry Johnson and Mr. Ben Henry Johnson, under the style or firm of "Henry Johnson and Sons," has been dissolved by mutual consent as from March 5th. All debts due to or owing by the late firm will for the purpose of adjusting the accounts of the partners be received and paid by the auditor, Mr. George Fewkes Clarke, chartered accountant, 7, Victoria Street, Liverpool. Mr. Ben Henry Johnson will for the future carry on business at 69, Victoria Street, London, and in Liverpool, under the firm of "Ben Henry Johnson and Sons."

SPECIALITY:
"ETERNIT" Terra-cotta Tiles, which neither break nor crumble, and at half the cost of Staffordshire Tiles, double the strength and about one-third of the weight.
Prompt Delivery.
Speedy fixing.
No breakages.

G. R. SPEAKER & Co., ENGINEERS.

Smooth on both sides. Roofs covered with "Eternit" Tiles weigh about 22 lbs. per square yard, or 66⅔ lbs. lighter weight per square yard than Bangor Slates. Greater mechanical and tensile strength. Non-Conducting. Non-Combustible. Impervious to sun, heat, frost and rain. Wind, dust and weather tight.

G. R. SPEAKER & Co., CONTRACTORS,

For enduring roofing material and workmanship,

Architects, Engineers & Surveyors

are respectfully recommended to specify

ETERNIT REGISTERED TRADE MARK 1904,

Guaranteed and manufactured under Hatschek's Original Specification and to decline all substitutes. No other roofing tile is "ETERNIT." (Regd.)

WRITE FOR SAMPLES AND FOR TENDERS FOR FIXING.

29, Mincing Lane, E.C.

Branch: 33, VICTORIA ST., BRISTOL.

28, MARK LANE, LONDON, E.C.

Branch: 33, VICTORIA ST., BRISTOL.

GUARANTEED:
Tensile strength, 5,781 lbs.
Crushing force, 8,281 lbs.
Per Square Inch and always increasing with age.
Immunity from repairs.

Architects, Engineers and Surveyors are earnestly warned not to confound 'Eternit' Tiles with so-called Asbestos Slates varying in quality, thickness and colour, advertised under fancy brands. 'Eternit' "endures not for an age, but for all time."

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about five days or longer after the date of this issue. Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders. The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the Contract, which requires them to pay the rates of wages current in the district.

BUILDING.

March 21—April 2. **PERTH (Scotland).**—Repair and reconstruction of the roofing on the west side of Perth general station. Comprising steel and iron work, carpenter and joiner work, slater work, glazier work, plumber work, and painter work, for the Perth General Station Joint Committee. Drawings may be seen at the office of the Engineer-in-Chief of the Caledonian Railway, Buchanan Street Station, Glasgow, where copies of the specification and schedule may be obtained, on deposit of £2 2s. An assistant engineer will attend at the station on March 21, at 11.45 a.m., to describe and point out the site of the works. Tenders to be lodged with Geo. G. Hamilton, secretary, Perth General Station Joint Committee's Office, Maritime Buildings, East Dock Street, Dundee.

March 24-31. **DARTFORD.**—Construction of a timber wharf at Little Powder Creek, Dartford, Kent, for the West Kent Main Sewerage Board, in accordance with drawing and specification prepared by G. Percy Williams, M.I.C.E., 14, Victoria Street, Westminster, engineer to the Board. Application for quantities to be made in writing to Henry F. Priter, Secretary, Park House, Bromley, Kent, not later than March 24, enclosing a postal order for £1 as deposit for a copy of the quantities. Drawing and specification may be seen between 10 a.m. and 1 p.m. at the offices of the engineer to the Board. Tenders to be delivered at the office of the Secretary. Satisfactory sureties in a bond of £100 will be required.

March 28. **NEWBLISS (Ireland).**—Additions and alterations to Killeevan Church, Newbliss, County Monaghan, for the Rev. Patrick McDonnell, P.P. Drawings and specification may be inspected at the Parochial House, Newbliss, or at the office of W. A. Scott, A.R.I.B.A., M.S.A., Architect, 45, Mountjoy Square, Dublin, to whom tenders must be sent.

March 29. **HAYES (Middlesex).**—Erection of St. Mary's parish room, for the Executive Committee. Information, etc., can be obtained on application to C. Dudley Lewis, High Road, Hayes, Middlesex.

March 29. **WEST HARTLEPOOL.**—Erection of bandstand on the Green, Seaton Carew, for the Corporation. Plan, etc., to be seen upon application at office of Mr. Nelson F. Dennis, M.InstC.E., Borough Engineer and Surveyor, Municipal Buildings.

March 29. **TREDEGAR.**—Erection of 76 or more houses proposed to be built at Tredegar for the Park View Building Club. Plans, specifications, and form of tenders may be seen at the office of Wm. Harris, Architect and Surveyor, Bank Chambers, Bargoed. Tenders to be sent in to the Chairman, J. Jackson, Esq., Boot Stores, 96, Commercial Road, Tredegar.

March 30. **CHESTERFIELD.**—Erection of new offices at the junction of West Bars with Foljambe Road, for the Gas and Water Board. Plans and specifications may be seen and bills of quantities and form of tender obtained on application to the Borough Surveyor's Office, Salter Gate, Chesterfield, on payment of £3 3s. Tenders to be delivered to Jno Middleton, Law Clerk, 24, Gluman Gate, Chesterfield.

March 30. **BELFAST.**—Erection of a terrace of six houses on the Ravenhill Road. Plans and specification may be had at the office of Thomas Houston, Architect and Civil Engineer, Kingscourt, Wellington Place, Belfast. Tenders to be lodged with William Beattie, Solicitor, Mayfair, Arthur Square.

March 30. **MIDDLETON.**—Erection of a new condenser at the Gasworks, for the Corporation. Further particulars and form of tender, which will contain a fair-wages clause, may be obtained on application to C. F. Broadhead, gas engineer, Gasworks, Middleton. Tenders, addressed to the Chairman of the Gas Committee, must be delivered at the office of Frederick Entwistle, Town Clerk, Town Clerk's Office.

March 30. **RAMSGATE.**—Erection of a new elementary infants' school in Lillian Road, Ramsgate, for the Corporation. Persons desiring to tender must apply, or send in their names, accompanied by a deposit of £2 2s., to the architect, W. T. Stock, at the office of Hinds and Son, architects, 57, Queen Street, Ramsgate, when a copy of the bill of quantities will be at once supplied. Tenders, addressed to the Chairman of the Works Committee, are to be delivered at the office of A. Blasdale Clarke, Town Clerk, Albion House, Ramsgate.

March 30. **BALLYBODEN.**—Erection of a public library at Ballyboden, Rathfarnham, for the Library Committee. The person (if any) whose tender may be accepted will be required to enter into a contract and bond for the due performance of the contract, and to furnish solvent security in connection therewith. Plans and specifications may be seen, and forms of tender obtained, at the office of the Architect, T. J. Byrne, A.R.I.B.A., 1, James's Street, Dublin, to whom tenders, addressed to the "Presiding Chairman, Whitechurch Library Committee," are to be delivered. Fair wages clause.

March 30. **WALTON.**—Construction of an open-air bath on land in Queen's Drive, Walton, for the Liverpool Corporation. Plans and specifications may be inspected and quantities obtained on application to the engineer and chief superintendent, W. R. Court, at his office, Municipal Offices, Liverpool, on deposit of £1 1s. Tenders must be delivered at the Town Clerk's Office, by letter post. Any tender which may be accepted will be subject to the sanction of the Local Government Board being given to the borrowing by the Corporation of the requisite amount, and to a contract to be prepared by the Town Clerk.

March 31. **MONTGOMERY.**—Erection of a dwelling house, etc., at Montgomery, for the Misses James, Plas Offa. Plan, etc., to be obtained on application to R. W. Davies, M.S.A., architect and Surveyor, Carno.

March 31. **ASHBURTON (Devon).**—Addition to the Ashburton and Buckfastleigh Cottage Hospital, for the Committee. Tenders to be addressed to H. Mallaby Firth, Hon. Secretary. Plan and specification may be seen at the hospital.

March 31. **RADYR.**—Erecting a club house. Plans and specification can be seen and bills of quantities obtained on deposit of £2 2s., on application to H. Snell, Architect, Hickman Road, Penarth. Tenders to be sent to W. T. Davies, hon. sec., 59, Queen Street, Cardiff.

March 31. **HALIFAX.**—Alterations to residence, Savile Park, Halifax. Bills of quantities may be obtained and plans and specifications inspected at the offices of Clement Williams and Sons, Architects, etc., Post Office Buildings, Commercial Street, Halifax, to whom tenders must be sent.

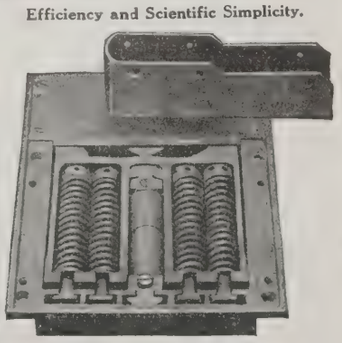
March 31. **GATESHEAD.**—Erection of the Brighton Avenue new school, for the Education Committee. Send names to the Architect, F. W. Purser, West Street, Gateshead, who will supply quantities. Applicants must deposit a fee of £1 1s. Tenders should be sent to the Education Offices, Gateshead.

March 31. **SALFORD.**—Building an addition to the disinfecting station at Mode Wheel, for the Corporation. Plans may be seen and the specified quantities and form of tender obtained at the office of the Borough Engineer. Tenders must be delivered to L. C. Evans, Town Clerk, Town Hall, Salford.

March 31. **YSTRADGYNLAIS.**—Alterations and additions to "Maesydderwen," to convert into County schools, for the Governors. Plans, specifications may be seen and bills of quantities obtained from the offices of J. Cook Rees, Architect, Neath. Tenders to be sent to B. L. Thomas, Clerk to the Governors, Tir Roger, Ystradgynlais.

March 31. **LARNE (Co. Antrim).**—Repairing and making additions to the Mission Hall, Pound Street, Larne, County Antrim, for the trustees of the John Getty estate. Copy of plans and specification may be had from John Seeds, Architect, 7, Donegall Square West, Belfast, with whom tenders must be lodged. The lowest or any tender not necessarily accepted.

March 31. **HIGH SPEN AND LEADGATE (Durham).**—Alterations and improvements to 38 cottages at High Spen, 10 cottages at Derwent Cottages, and 4 cottages at Leadgate, Co. Durham, for the Consett Iron Co., Ltd. Plans and specifications may be seen and quantities obtained upon application to the architect, Chas. E. Oliver, at the company's general offices, Consett.



March 31. **WEDNESBURY.**—Erection of public sanitary conveniences (exclusive of sanitary fittings) near the Market Place. Plans, specification, and conditions of contract (no quantities) can be inspected, and form of tender obtained, at the offices of E. Martin Scott, Borough Engineer and Surveyor, Town Hall, Wednesbury, to whom tenders must be sent. The contractor will be required to pay the ordinary rate of wages current in the district.

March 31. **CHISLEHURST.**—Erection of stables, cart-sheds, caretaker's house, mortuary and cemetery chapel, at Perry Street, for the U.D.C. Forms of tender, with a copy of the bills of quantities, can be obtained on application at the Council offices, Church Row, Chistlehurst, on deposit of the sum of £2 2s. The plans, sections, specification, and conditions of contract may be seen at the Council offices. Tenders must be delivered to H. F. Knight, Clerk of the Council, Council Offices, Chislehurst.

March 31. **BROMSGROVE.**—Erection of a Council secondary school, in Stourbridge Road, for the Worcestershire Education Committee. Applications for forms of tender and bills of quantities may be made by March 10, to the County Education Office, Worcester, accompanied by a deposit of £2 2s. The drawings may now be seen at the office of the architect, G. H. Gadd, Town Hall Chambers, Bromsgrove. Tenders must be addressed to the Director of Education, 37, Foregate Street, Worcester.

March 31. **WALTON-ON-NAZE.**—Erection of a new public elementary school at Walton-on-Naze, for the Essex Education Committee (Tendring District Sub-Committee). Send names to the architects, Tomkins, Homer and Ley, Frinton-on-Sea. Any tender recommended for acceptance will be subject to the approval of the Essex County Council and the Local Government Board. A bond for the proper completion of the work will be required from an approved guarantee society. A deposit of £3 3s. will be required for a copy of the bill of quantities.

March 31. **BERE ALSTON.**—New elementary school for 124 children at Bere Alston, for the Devon County Education Authority. Bills of quantities will be available in due course on payment of £1 1s. Contractors desiring to tender must apply to the County Architect (Education), 1, Richmond Road, Exeter, not later than the first post on Wednesday, March 9, 1910, enclosing a crossed cheque drawn in favour of the County Treasurer. Quantities will be issued about March 16, and tenders must be delivered at the Architect's office.

March 31. **BERMONDSEY.**—Providing and fixing lantern light over kitchen at the Workhouse, Tanner Street, Bermondsey, S.E., for the Guardians. Persons desirous of tendering may obtain printed forms of tender and specification containing full particulars and conditions of contract, between the hours of 10 a.m. and 12 noon daily, from 21st March to 24th March, 1910, by depositing a £5 Bank of England note (cheques or cash will not be received), at the office of E. Pitts Fenton, Clerk, 283, Tooley Street, S.E., to whom tenders must be sent.

April 1. **ASTON.**—Aston Provided School.—Drainage and new conveniences (builder, joiner, and plumber), for the West Riding Education Commistee. Plans may be seen and specifications with quantities obtained on application to the Education Architect, County Hall, Wakefield. A sum of £1 in each case must be sent by separate letter to the West Riding Treasurer, County Hall, Wakefield. Tenders must be sent to Francis Alvey Darwin, Clerk of the County Council, County Hall, Wakefield.

April 1. **BRYNMAWR (Brecon).**—Erection of proposed cookery-kitchen and classroom at Brynmawr Council School, for the Breconshire Education Committee. Send names to Charles W. Best, M.I.C.E., surveyor to the Education Committee, County Hall, Brecon, accompanied by particulars of works recently carried out by them, and the names of two references relative to the quality of the work done, unless they have previously carried out work for the county. Such persons can see plans and specification and obtain copies of bills of quantities on the usual conditions at the Surveyor's office. Tenders must be sent to the Surveyor.

April 2. **PORTADOWN.**—Erecting a residence and making additions to the Masonic Hall. Tenders, marked "Chairman, Masonic Committee," to be lodged with J. W. Walby, Architect, Portadown. Plans and specifications may be seen at the office of the architect.

April 2. **DONINGTON.**—(Spalding).—Erection of an elementary school, for the Governors of Cowley's Charity. Drawings and specification may be inspected at the offices of Jas. Rowell, architect, Church Lane, Boston, and a copy of quantities may be obtained upon the deposit of £2. Tenders to be delivered to Ben Smith, Solicitor, Donington, Spalding.

April 2. **CIRENCESTER.**—Demolition of buildings adjoining the Police Station, and construction of a new Superintendent's house upon the site, for the Gloucestershire Standing Joint Committee. Plans and copies of specification may be seen, and bills of quantities and forms of tender obtained at the office of E. S. Sinnott, M.I.C.E., County Surveyor, Shirehall, Gloucester. Persons tendering will be required to pay a deposit of £2.

April 2. **SHEFFIELD.**—Erection of school buildings, etc., Psalter Lane, Sheffield, for the Committee of the Boys' Charity School. Drawings and specifications may be seen and bills of quantities obtained on application to Gibbs, Flockton, and Teather, Architects, 15, St. James' Row, Sheffield. Tenders, on forms supplied, to be delivered to "The Chairman, Building Committee, Boys' Charity School, East Parade, Sheffield."

April 2. **PERTH.**—Repair and reconstruction of the roofing on the west side of Perth General Station. The contract comprises steel and iron work, carpenter and joiner work, slater work, glazier work, plumber work, and painter work. Drawings may be seen at the office of the Engineer-in-Chief of the Caledonian Railway, Buchanan Street Station, Glasgow, where copies of the specification and schedule may be obtained on deposit of £2 2s. An assistant engineer will attend at the station on 21st inst., at 11.45 a.m. Tenders to be lidged with Geo. G. Hamilton, Secretary, Perth General Station Joint Committee's Office, Maritime Buildings, East Dock Street, Dundee.

April 3. **BUGLE (St. Austell).**—Erection of a concrete chapel at Bugle. Plans can be seen at Sunny Bank, Mount Charles, St. Austell. Tenders to be sent to the Rev. J. T. Morris, Primitive Methodist Minister, at above address.

April 5. **WALTHAM.**—Alterations and repairs required to be carried out at Waltham Council school, for the Committee. Specifications and plans can be seen at the house of the correspondent, C. J. Wanley Croft, Bridge, Canterbury. Tenders must be forwarded to the above-named correspondent.

April 5. **BIRMINGHAM.**—Alterations to Birmingham head post office, for H.M. Commissioners of Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to H.M. Office of Works, Birmingham. Bills of quantities and forms of tender may be obtained at H.M. Office of Works, Storey's Gate, London, S.W., on payment of £1 1s. Tenders must be delivered, addressed to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

April 5. **MOUNTAIN ASH.**—Erection of an infants' school, with offices, etc., at Clarence Street, for the Education Committee. Plans and specifications may be seen, and forms of tender and bills of quantities obtained, on application to the Architect, W. H. Williams, Town Hall, Mountain Ash, upon the deposit of £2 2s. The committee undertake to open only the bills of quantities sent in by the contractor whose tender will be accepted, and to return all the other bills of quantities unopened. Tenders and bills of quantities to be sent to A. Morgan, Director of Education, Town Hall, Mountain Ash.

April 6. **BOVEY TRACEY.**—New elementary school for 200 children, and a cookery and manual training centre, etc., for the Devon County Education Authority. Bills of quantities will be available on payment of £1 1s. Contractors desiring to tender must apply to the County Architect (Education), 1, Richmond Road, Exeter, not later than Friday, March 11, 1910, enclosing a crossed cheque drawn in favour of the County Treasurer. Quantities will be issued about March 22, and tenders must be delivered at the architect's office.

April 6. **EDENBRIDGE.**—Erection of a new Council school to accommodate 200 children, for the Kent Education Committee. Plans and specification, and form of contract, may be inspected at the offices of the Committee, until the time appointed for the delivery of the tenders. Any person desiring to tender and to receive a copy of bills of quantities must send in his name to Fras. W. Crook, Secretary, Caxton House, Westminster, S.W., accompanied by a deposit of £1, not later than noon on March 10, 1910. Tenders must be delivered to the School Correspondent, Chas. Sheal, High Street, Edenbridge, Kent.

April 7. **SWANSEA.**—Extension of the Victoria warehouse for a distance of 67ft. with four floors, and erecting two additional floors on the old building, for the Harbour Trust. Plans, specification and quantities can be seen and forms of tender obtained on application to A. O. Schenk, M.InstC.E., at the Harbour Offices, Swansea. Tenders should be delivered to Talfourd Strick, Clerk, Harbour Offices, Swansea.

April 7. **LONDON (Walworth).**—Reconstruction of part of drainage and alterations to and addition of new w.c.'s on the women's side of Newington workhouse, Westmoreland Road, Walworth, S.E., for the Southwark Guardians. A copy of the specification, plan, and form of tender may be obtained from A. W. Tribe, Architect, 120, Clapham Road, S.W., on the deposit of £2 2s. Tenders to be sent to Sydney Wood, Clerk, Union Offices, Ufford Street, Blackfriars Road, S.E.

April 9. **TINSLEY.**—Erection of a boarded fence dividing the cricket ground from the recreation ground, for the Parish Council. Specification and quantities can be obtained on receipt of stamped addressed foolscap envelope, from J. L. Winkley, Clerk to the Council, 15, Harrowden Road, Tinsley, Sheffield, to whom tenders must be sent.

April 11. **SHOTLEY BRIDGE (Gateshead).**—Erecting new hospital for consumptive patients on the Whinney House Estate. Persons desirous of tendering are requested to send their names to George Craighill, Union Clerk, Poor Law Union Offices, Gateshead, to whom tenders must be sent. Quantities and further information will be forwarded in due course. Plans, etc., may be seen at the offices of the architects, Newcombe and Newcombe, 89, Pilgrim Street, Newcastle-on-Tyne. Names must be sent in by March 25.

April 11. **LINCOLN.**—Construction of a brick and stone tower, 108ft. high to T.W.L., to support a spherical bottomed steel tank, containing over 300,000 gallons of water, and subsidiary works at Westgate, Lincoln, for the Corporation. Drawings may be seen now, and specification, bill of quantities and form of tender obtained at the office of the Engineer, Mr. Neil McK. Barron, Waterworks Engineer, Lincoln upon production of a receipt from the City Accountant for the sum of £5 5s. Tenders, addressed to the Chairman of the Waterworks Committee, to be delivered at the office of W. T. Page, Deputy Town Clerk, Bank Street, Lincoln.

April 11. **YORKSHIRE (East Riding).**—(a) The erection of a teacher's house and alterations to school at South Duffield; (b) for alterations and additions to the Council school at Pocklington; (c) for alterations and additions to the Council school at Withernwick, for the Education Committee of the C.C. Plans and specifications may be seen and forms of tender obtained on application to the building surveyor, County Hall, Beverley. For the convenience of persons desirous of tendering, a copy of the plans and specifications, together with forms of tender, will be deposited at the respective schools. Tenders to be delivered to John Bickersteth, Clerk to the East Riding Education Authority, County Hall, Beverley.

April 19. **HAZEL GROVE (Stockport).**—Erection of a new public elementary Council school on land in Chapel Street, Hazel Grove, near Stocport, to accommodate 800 children, with housewifery, laundry, and cookery centres, and caretaker's quarters, for the Cheshire Local Education Authority. Plans and specifications may be inspected and quantities obtained from the architect, C. T. Adshead, Leinster Chambers, 4, St. Ann's Square, Manchester, on payment of a deposit of £2 2s., on and after Tuesday, March 29. Tenders to be sent to J. W. Bain, Clerk, School Brow, Romiley, near Stockport.

April 21. **BUILTH WELLS.**—Erection of a new mixed and infants' school (346 places), and cookery kitchen, at Builth Wells, for the Breconshire Education Committee. Names to Charles W. Best, M.Inst.C.E., Surveyor to the Committee, County Hall, Brecon, accompanied by particulars of works recently carried out, and the names of two references relative to the quality of the work done.

No date. **BINGLEY.**—Bricklayer's and mason's, carpenter's and joiner's, plumber's and glazier's, plasterer's, and slater's work required in the erection of a detached villa residence in Bramham Road, Bingley. Particulars may be had from Wm. Rhodes Nunns, Architect and Surveyor, Bingley.

No date. **SHREWSBURY.**—Persons desirous of tendering for the erection of the Corporation stables and depot at Roushill, for the Corporation, are requested to forward their full name and address not later than the 21st inst., together with a deposit of £2 2s., to Arthur E. Williams, Architect and Surveyor, County Chambers, 12, High Street, Shrewsbury. Bills of quantities and form of tender will be forwarded in due course.

No date. **WYE.**—Erection of additions to the College buildings at Wye, for the Governors of the South-Eastern Agricultural College. Persons desirous of tendering are requested to send in their names to A. E. Lacey, A.R.I.B.A., Architect, Ashford, Kent, enclosing a cheque for £2 2s. as deposit upon receipt of which a copy of the bills of quantities will be forwarded. Drawings and specifications may be seen at the office of the architect, 13, North Street, Ashford.

ENGINEERING.

March 28. **EDINBURGH.**—Construction of sidings and loading banks at the Gorgie Cattle Markets, for the Corporation. Drawings and specification may be seen at the office of Blyth and Westland, C.E., 135, George Street, Edinburgh, and the specification with copies of the schedule of quantities and form of tender, may be obtained from them on deposit of £1 1s. An engineer will meet intending offerers at the Gorgie Tramway Terminus, on Monday, the 21st inst., at 12 o'clock noon, to exhibit the plans and point out the site of the works. Tenders must be lodged with Blyth and Westland.

March 29. **POLESWORTH.**—Laying about 4,000 lineal yards of stoneware pipe sewers and building the necessary manholes, etc.; also for the construction of sewage tanks, filters, pumping station, pumping main, and incidental works, for the township of Polesworth, within their district. Drawings may be inspected at the offices of H. J. Coleby, Engineer and Surveyor, Council Offices, 102, Long Street, Atherstone, where also a copy of the specification and bill of quantities may be obtained upon deposit of £2 2s. Tenders must be delivered to W. A. Hatton, the Clerk to the Council, 120, Long Street, Atherstone.

March 30. **WETHERBY.**—Construction of about 3,700 lineal yards of 9in., 8in., and 6in. earthenware pipe sewers, with manholes, etc., also sewage tanks, continuous filters, and other works, for the R.D.C. Drawings and specification may be seen, and quantities, with form of tender, obtained at the office of the Engineer, H. A. Johnson, M.I.C.E., 15, The Exchange, Bradford, on payment of a deposit of £2 2s. Tenders to be sent to E. N. Coates, Clerk to the Council, Wetherby.

March 31. **PENARTH.**—Construction of two ferro-concrete (Hennibique system) footbridges, in the Dingle, for the U.D.C. Plans and specifications may be seen and copies of quantities obtained on application to Edgar J. Evans, A.M.I.C.E., Surveyor, District Council Offices, Penarth.

March 31. **SALFORD.**—Provision and erection of the steelwork, etc., brickwork, concrete, etc., required in the repairing and strengthening Palatine Bridge over the River Irwell, for the Building and Bridges Committee of the Borough. Drawings may be seen, and specification and bill of quantities obtained at the offices of the Engineers, C. S. Allott and Son, 46, Brown Street, Manchester. A deposit of £2 2s. will be required for the specification and bill of quantities. Tenders to be delivered to L. C. Evans, Town Clerk, Salford.

March 31. **LONG EATON (Notts.).**—Erection of (1) proposed bridge over Erewash canal, Sawley Road, Long Eaton, with approaches and other contingent works; (2) proposed widening of existing bridge over the Erewash canal, Derby Road, with approaches and other contingent works; brick, concrete, and road-making works, for the U.D.C. Plans may be inspected, and general conditions, specification, bill of quantities, etc., obtained from Frank Worrall, A.M.I.C.E., Engineer and Surveyor, Electricity Supply Works, Long Eaton, on deposit of £3 3s. Tenders, addressed to the Chairman of the Council, are to be delivered to the Engineer.

March 31. **YARDLEY.**—Provision and construction of about 983 yards of 2ft. 6in. brick and concrete sewer, and 90 yards of 2ft. 6in. cast-iron sewer, partly in tunnel under a canal; together with manholes and other works appertaining thereto, for the R.D.C., in accordance with plans, drawings, specification, and conditions of contract; which may be seen on application to the Acting Engineer and Surveyor, Mr. Philip H. Thompson, at the Council House, Sparkhill, near Birmingham, from the 21st to 24th March, and on the 29th and 30th March. Specification, bill of quantities, and form of tender may be obtained on deposit of £3 3s., with Francis Ladbury Thompson, Clerk of the Council, The Council House, Sparkhill, near Birmingham, to whom tenders must be sent. The contractor whose tender is accepted will be required to pay his workmen not less than the minimum standard rate of wages in the district for each class of labour respectively, and to observe the recognised hours and conditions of labour generally, and shall forfeit to the Council the sum of £1 for each infringement of this clause, and a further sum of £1 for each day such infringement continues after his attention has been called to it. The contractor shall, whenever possible, in the execution of the works, give preference to such competent workmen of the class required as may be residents of the parish of Yardley, and may offer themselves for employment.

April 2. **ABERDEEN.**—Reconstruction of a steel girder bridge over the River Deveron at Cairnford, near Huntly, for the Huntly District Committee, in accordance with plans and specifications, which may be seen with James Barron, M.I.C.E., Central Chambers, 216, Union Street, Aberdeen, from whom schedules of quantities can be obtained on deposit of £1. Tenders to be lodged with J. R. M'Math, District Clerk, Huntly.

IRON AND STEEL.

March 28. **GLASGOW.**—Iron and steel fencing work required in connection with buildings proposed to be erected in Moore Street and Hill Street, for the Corporation. Plans may be seen at the office of the City Engineer, and forms of tender obtained at the office of Public Works, City Chambers, 64, Cochrane Street, by depositing £3 3s. Tenders must be lodged with A. W. Myles, Town Clerk, City Chambers, Glasgow.

March 30.—**HARTLEPOOL.**—Supply of cast-iron palisading, with carriage and wicket gates, for their new cemetery, for the Corporation. Plans and specifications may be seen and full particulars obtained on application at the office of H. C. Crummack, A.M.I.C.E., borough engineer, Borough Buildings, Hartlepool. Tenders must be addressed to the Chairman of the Property (Burials) Committee.

March 30. **BELFAST.**—Supply of about 100 tons of best rolled steel girder tramway rails, with fishplates and bolts to suit, of which 50 tons are to be delivered on the County Antrim Side and 50 tons on the County Down Side of the River, where pointed out, the whole to be weighed on one of the Harbour Comissioners' weighbridges, at the contractor's expense. Specification, form of tender, section of rail, etc., and any further information required may be obtained from the Harbour Engineer, W. Redfern Kelly, M.Inst.C.E. Tenders stating time of delivery, to be addressed to W. A. Currie, Secretary, Harbour Offices, Belfast.

April 2. **BRADFORD.**—Supply and delivery of steel girder tram rails and steel poles, for the Corporation. Drawing, specification, and form of tender for rails and poles may be obtained at the office of W. H. S. Dawson, City Engineer and Surveyor, Town Hall, Bradford. Tenders to be sent to Frederick Stevens, Town Clerk, Town Hall, Bradford. The contracts will be let subject to the fair contracts clauses of the Corporation, which may be seen at the Town Clerk's office, and which the contractor will be required to sign.

PAINTING.

March 28. **CLITHEROE.**—Painting, etc., offices, showrooms, and house, at the gas works, for the Gas Committee. Specification may be seen at the offices of Robert Barrett, Gas Manager, Gas Works, Clitheroe. Tenders to be addressed to the Chairman of the Gas Committee, and delivered at the Town Clerk's office.

April 21. **HUDDERSFIELD.**—Painting and decorating of the Town Hall, crush room, and artistes' retiring rooms, for the Corporation. The successful tenderer will be required to execute a contract, the draft of which may be inspected at the Town Clerk's Office, Town Hall. Plans, specifications, and general conditions may be seen, and bills of quantities and forms of tender obtained, on application at the offices of K. F. Campbell, M.Inst.C.E., Borough Engineer, 1, Peel Street, Huddersfield. Tenders to be addressed to "Town Clerk, Town Hall, Huddersfield."

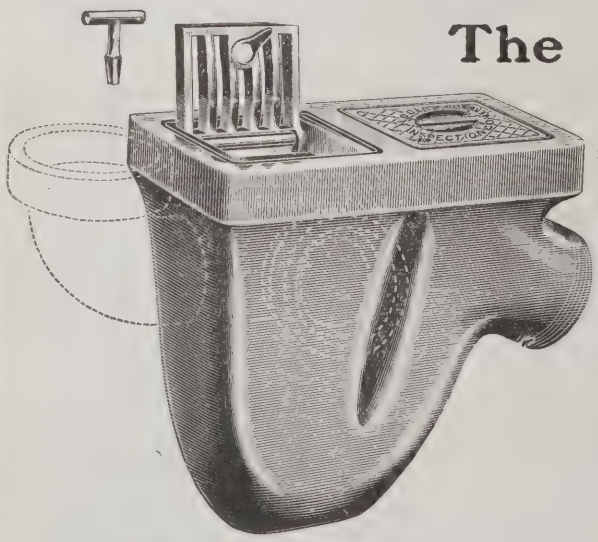
PLUMBING AND SANITARY.

April 7. **LONDON (Walworth).**—See under buildings.

ROADS AND CARTAGE.

March 28. **TENTERDEN.**—Supplying and delivering the following materials, for the R.D.C.:—620 cubic yards granite; 3,270 cubic yards stone cliff rock; 570 cubic yards flints; 1,590 cubic yards rag stone; 140 tons of beach; also for steam rolling the above. Further particulars and forms of tender may be obtained of W. L. C. Turner, District Surveyor, Tenterden. Tenders to be sent to J. Munn-Mace, Clerk, Tenterden, Kent.

March 29. **WITHNELL.**—Materials for the 12 months ending March 31, 1911: Broken granite, limestone, setts and kerbs, gas slack. Also for the sale of tar and ammoniacal liquor from the gas works. Particulars and forms of tender may be had from Thomas Moss, surveyor, Council Chambers, Brinscall, near Chorley, to whom tenders must be sent.



March 29. **YARMOUTH.**—Supply of:—2,400 tons of 1½in. Guernsey granite; 2,000 tons 1½in. basalt, quartite, Penlee, or other stone of equal value, for road making; 1,000 tons 5in. granite setts; 2,000 yards cube broken flint; 800 yards cube coarse gravel; 500 yards cube footpath gravel. Specifications, form of tender, and envelopes, in which tenders must be enclosed, can be obtained at the office of J. Wm. Cockrill, M.InstC.E., Borough Surveyor, Town Hall, Great Yarmouth. Tenders are to be delivered at the office of the Town Clerk, Town Hall, Great Yarmouth.

March 29. **GRETTON.**—Supply of about 920 tons of broken XX and XXX granite and screenings, for the R.D.C., on or before December 1 next, to be delivered (carriage free) at the following stations:—Corby and Weldon, Gretton, Fineshade Siding, Harringworth, Rockingham, and Wakerley, at such times and in such quantities as the Surveyor of the Council shall from time to time order. Forms of tender and specifications may be obtained on application (enclosing a stamped, addressed envelope) to Fredk. Oakley, Clerk, Council Offices, Uppingham, to whom tenders must be sent.

March 29. **WARBLINGTON.**—Victoria Road, Bridge Road, and Washington Road.—Forming, sewering, levelling, paving, metalling, channelling, and making good the above roads and the footways thereof at Emsworth, within the district, for the U.D.C. Plans, specifications, and conditions can be seen, and forms of tender obtained, on application to H. W. Stringfellow, C.E., Surveyor to the Council, Council Offices, North Street, Emsworth. Tenders for each road must be delivered at the office of J. W. Loader Cooper, Clerk to the Council, 14, Queen Street, Emsworth. The person or persons whose tender is accepted will be required to enter into the usual formal contract and to give proper security for due performance.

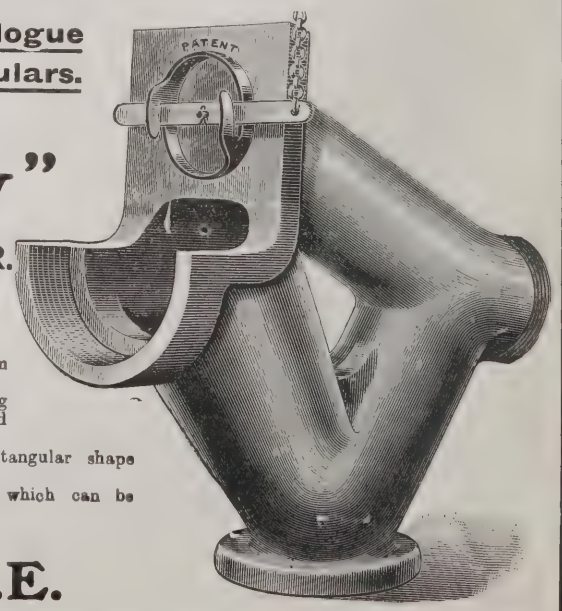
DOULTON & Co. LIMITED.

The "Hygeian" Gully.



This Gully affords great facility for inspecting and sweeping the drain. The Inspection Cover, being on the surface, is readily accessible and always in sight. The Cover consists of a plate fitting into a fixed frame with tongue-and-groove joint, and is secured by gun-metal screws.

DIMENSIONS: Grating, 6 in. by 6 in.; Outlet, 4 in. diameter,

See our Catalogue for full particulars.

THE "City" INTERCEPTOR.

(Regd. No. 432023.)

In this design are embodied all the features proved by experience to be desirable from the point of view of the most modern sanitary practice.

The shape provides cascade action at inlet and weir at outlet, with rapid and self-cleansing flush. The body of water retained in the trap is the minimum compatible with efficiency and there is ample seal.

The cleansing-arm is of large diameter to permit of ready access to sewer, and the rectangular shape of the front enables the brickwork to be built up to it in a neat and workmanlike manner.

The illustration shows the inspection socket fitted with brass patent lever stopper, which can be released from top of manhole.

H.D 27. **LAMBETH, LONDON, S.E.**

March 29. **FAILSWORTH.**—Supply of materials to be delivered at such times and in such quantities as the Council may require during the period ending March 31, 1911, for the U.D.C., namely:—Lonkey and grit paving setts, flags, curbs, rubble, stone scaplings, Portland cement, earthenware pipes, bends, junctions and gullies, iron manhole and lampeye covers, iron street gullies, manhole step castings, Buxton lime, green crystal coperas. Forms of tender and full particulars may be obtained at the office of G. F. Gray, Surveyor to the Council. Tenders must be delivered to H. C. Broome, Clerk to the Council, Council Offices, Failsworth.

March 30. **HOO (Kent).**—Supply of the following materials to be delivered on the roads, for the R.D.C.:—Broken granite, unbroken Kentish ragstone, unbroken surface picked flints, unbroken pit flints and hoggin, also carting (day work), and steam road rolling and scarifying. Forms of tender may be obtained of Richard Phillott Smyth, Clerk, Strood, Kent.

March 30. **BARNET.**—Making-up of the private streets within their district known as Gladsmuir Road and Hadley Grove, for the Barnet U.D.C. Plans and specifications can be seen and all information obtained on application to W. F. Wilkins, M.S.E., Surveyor, 40, High Street, Barnet, between 9 and 10 a.m., or by appointment. Tenders should be addressed to H. W. Poole, Clerk, Barnet, and delivered at the Council's offices.

March 30. **WINDLESHAM.**—Supply of the following road materials, during the year ending March 31, 1911, for the U.D.C.:—1½in. and 2in. Leicestershire or Guernsey granite; Leicestershire granite chippings; Farnham Hungry Hill flints; Farnham gravel screenings; local screened gravel and siftings; hire of a 10-ton steam road roller, as may be required during the same period. Tender forms may be obtained of the Surveyor at the Council Offices, Bagshot, and tenders should be delivered to Edwyn T. Close, Clerk to the Council, High Street, Bagshot.

March 30. **PRESTWICH.**—Private street improvement in Edward Street, and passage between Edward Street and Clifton Road, and the supplying and laying of a sewer in Rendlesham Street, between Taylor Street and Stanley Street, within the Urban District, for the U.D.C., subject to general conditions of contract, which can be inspected at the Surveyor's Office, Chester Bank, Prestwich, any morning between the hours of 9 a.m. and 11 a.m. The plans, specifications, and quantities will be open for inspection at the office of the Surveyor, Chester Bank, between the hours above mentioned. Copies of the bill of quantities and any further information that may be required can be obtained from the Surveyor, on deposit of £1 1s. Tenders to be delivered to Lewis A. Orford, Law Clerk to the Council, Council House, Prestwich, Manchester.

March 31. **BILLINGBOROUGH.**—Supplying and laying about 400 sq. yards of two-inch flagging in Billingborough, for the Highways Committee of the Kesteven C.C. Form of tender may be obtained from W. B. Purser, County Surveyor, Grantham.

March 31. **BRANDON.**—Making-up of Railway Street and the road leading between Station Avenue and Commercial Street, Brandon Colliery, for the U.D.C. Plans may be seen and quantities obtained from Geo. G. Donkin, Surveyor, Langley Moor. Tenders to be sent to J. G. Wilson, 5, North Bailey, Durham.

March 31. **MALDON.**—Making-up of Mount Pleasant and Tenterfield Roads in the Borough for the Council. Plans and specifications may be seen and forms of tender obtained at the office of T. R. Swales, Borough Surveyor. Tenders to be sent to F. H. Bright, Town Clerk, Town Clerk's Office, High Street, Maldon.

March 31. **SUFFOLK.**—Steam rolling on 305 miles of main road during the financial year ending March 31, 1911, for the East Suffolk C.C. Specification and form of tender can be obtained on application from the Chief Surveyor, County Hall, Ipswich. Tenders to be sent to A. Townshend Cobbold, Clerk of the County Council, County Hall, Ipswich.

March 31. **BRIGG.**—Relaying of about 1,400 sq. yds. of Bigby Street with tar macadam, for the U.D.C. The successful contractor will be required to enter into a contract with two sureties in the sum of £50 each for the due performance of the contract, and must guarantee the roadway to wear satisfactorily for three years. Specifications and forms of tender can be obtained on application to G. S. Sowter, Clerk to the Council, Brigg, to whom tenders must be sent.

April 1. **FOLKESTONE.**—Levelling, paving, channelling, metalling, etc., and making good of Dudley Road, for the Corporation. Plans and specification may be seen and forms of tender obtained on application to A. E. Nichols, M.I.C.E., (Borough Engineer), Corporation Offices, Church Street, Folkestone. Tenders to be addressed to A. F. Kidson, Town Clerk, Town Clerk's Office, Folkestone.

April 1. **RAMSEY (Huntingdonshire).**—Supply of 200 tons of broken granite, size X or 2½in. gauge; 200 tons of broken granite, size XX or 1⅝in. gauge; 50 tons of broken granite, size XXX or 1in. gauge; 150 tons of tar macadam, 2½in. gauge, for the U.D.C. To be delivered to the G.N. or G.E. stations at Ramsey, Hunts., from April to December next. Tenders, accompanied by samples, to be sent (carriage paid) to the Council on or before April 1 next. No forms of tender are issued.

April 2. **SUDBURY.**—Supply and delivery of:—(1) broken granite; (3) cement, etc.; (5) stoneware pipes, for the year ending March 31, 1911, for the Corporation. Full particulars and forms of tender may be obtained on application to Wm. I. Tait, A.M.I.C.E., Borough Engineer and Surveyor, The Town Hall, Sudbury, Suffolk, to whom tenders must be sent.

April 2. **BLEAN.**—Supply and delivery of the undermentioned quantities of materials required in the following parishes during the year ensuing from April 1 next, for the R.D.C.:—Blean, 250 cub. yds. gravel, 60 cub. yds. fine gravel, 7 cub. yds. fine chalk; Chislet, E., 1,020 cub. yds. gravel, 21 cub. yds. finechalk; Chislet, W., 70 cub. yds. gravel, 12 cub. yds. fine gravel; Herne, E., 1,310 cub. yds. gravel; 60 cub. yds. chalk flints; Herne, W., 1,550 cub. yds. gravel, 230 cub. yds. fine gravel, 21 cub. yds. fine chalk, 40 cub. yds. chalk flints; Hoath, 300 cub. yds. gravel, 65 cub. yds. fine gravel; Reculver, 440 cub. yds. gravel; St. Stephen, 630 cub. yds. gravel, 80 cub. yds. fine gravel, 14 cub. yards fine chalk; St. Dunstan, 60 cub. yds. gravel, 7 cub. yds. fine gravel; Sturry, 430 cub. yds. gravel, 95 cub. yds. fine gravel, 14 cub. yds. fine chalk; Swalecliffe, 400 cub. yds. dug flints, 60 cub. yds. fine gravel, 14 cub. yds. fine chalk; Westbere 120 cub. yds. gravel, 25 cub. yds. fine gravel, 7 cub. yds. fine chalk; Whitstable-cum-Seasalter, 1,450 cub. yds. dug flints, 260 cub. yds. fine gravel, 40 cub. yds. fine chalk. Tenders are also invited for the cartage of materials, steam rolling and team labour required in the several parishes in the district during one year, from April 1 next. Tenders must be made on a form to be obtained from J. E. Burch, Clerk to the Council, and must be delivered at his office, 39, Castle Street, Canterbury. Any further information may be obtained from the Surveyor, F. A. Ward, Eddington, near Herne Bay.

April 4. **MIDDLETON.**—Supply of setts, flags, sanitary tubes, granite, macadam, etc., for the Corporation. Application for information forms of tender, etc., to be made to F. Entwistle, Town Clerk, Middleton.

April 4. **WICKHAM MARKET (Suffolk).**—Supply of about 3,000 tons of granite, broken to 1½in. gauge, delivered in trucks at the following stations, before July 31, 1910: Aldeburgh, Framlingham, Marlesford, Parham, Saxmundham, Snape, and Wickham Market, on the Great Eastern Railway, and Kenton, on the Mid-Suffolk Light Railway, and in barges alongside Orford Quay and Iken Cliff, in the River Alde, for the Plomesgate Rural District Council. Tenders, with samples, to be sent to T. Waller Read, clerk, Board Room, Wickham Market. Forms of tender may be had on application to the Clerk.

DESIGNS FURNISHED FOR PUBLIC BUILDINGS.

Illustrated Catalogue Free on Application. *Architects' Suggestions embodied in Special Designs.*

April 4. **PLOMESGATE.**—About 3,000 tons of granite, broken to 1½ inch gauge, delivered in trucks at the following stations, before July 31, 1910:—Aldeburgh, Framlingham, Marlesford, Parham, Saxmundham, Snape, and Wickham Market, on the Great Eastern Railway, and Kenton, on the Mid-Suffolk Light Railway, and in barges alongside Orford Quay and Iken Cliff, in the River Alde. Tenders, with samples, to be sent to T. Waller Read, Clerk, at the Workhouse at Wickham Market, Suffolk. The Council reserve the right of accepting a portion of any tender to the exclusion of the remainder. Forms of tender may be had on application to T. Waller Read, Clerk, Board Room, Wickham Market.

April 6. **LYDD.**—Supply and delivery (free on rail, at Lydd Station) of road material, for the T.C.—450 tons 1⅜ gauge Rhenish columnar basalt; 20 tons 1¼in. gauge Rhenish columnar basalt; 10 tons ¾in. chippings. Material to be delivered at such time as Surveyor may direct. Tenders, also samples, must be sent to Thomas Kettle, Borough Surveyor, Lydd. No form of tender supplied.

April 6. **WANSTEAD.**—Making up the street known as Warwick Road, for the U.D.C. Copies of specification and form of tender can be obtained and contract form inspected at the Council Offices, Wanstead, N.E., (Surveyor's Department). Tenders are to be delivered at the Council Offices, Wanstead, N.E.

April 7. **EASTBOURNE.**—For the supply of road materials (stone, flints, beach, and stone chippings), and for cartage of same from railway stations, for the R.D.C. All materials will be required to be delivered before Sept. 30. Tenders to be addressed to the Chairman of the R.D.C. at the Board-room of the Eastbourne Guardians, Avenue House, Eastbourne. Forms of tender may be obtained from T. E. Varley Kirtlan, clerk, 92, Terminus Road, Eastbourne, or C. M. Carter, Mount Sorrell Hampden Park, near Eastbourne, on forwarding stamped addressed foolscap envelope.

April 11. **WANDSWORTH.** — Making up and paving of that part of Coplev Park, Streatham, which lies between Streatham Common South and Heybridge Avenue, for the Borough Council. The specification and drawings may be seen, and forms of tenders obtained at No. 56, East Hill, Wandsworth, S.W., upon payment of a deposit of £: 5s. Tenders must be delivered at the Council House, East Hill, Wandsworth, S.W., and may be placed by the person tendering in the box provided for the purpose. Persons tendering must in the case of all workmen employed by them pay wages at no less and observe hours of labour not greater than the rates and hours recognised by the associations of employers and employees and in practice obtained in the district where the work is to be executed.

April 11. **BRIGHOUSE.**—Repaving of a portion of Birds Royd Lane with granite setts on concrete (the setts to be provided by the Corporation). Plans and sections may be seen, and specification and bills of quantities obtained upon application to S. S. Haywood, Borough Engineer and Surveyor, Municipal Offices, Brighouse. Tenders, accompanied by the priced bill of quantities, to be sent or delivered to Jas. H. Rothwell, Town Clerk, Town Clerk's Office, Municipal Offices, Brighouse.

April 11. **BECKENHAM.**—Making-up of Faversham and Shaftesbury Roads, for the U.D.C. The works comprise the following:—130 cubic yards, flint, 1900 lin. ft. second-hand channelling, 735 super. yds., Burgess Hill paving (bricks supplied), together with the remodelling of about 1,500 super. yds. of roadway. Plans and sections may be seen, and bills of quantities, specifications, and forms of tender obtained, on application to John A. Angell, Surveyor, on the production of a receipt from the collector (who attends his office daily from nine to ten a.m. only, except on Tuesdays, when his hours are from nine a.m. to one p.m.), for a deposit of £2. A clause will be inserted in the contract providing that the contractor shall (1) pay to the employees the wages generally accepted as current for workmen engaged on similar work in the town where the work is executed, and (2) to the extent of 75 per cent. at least of the staff required in the execution of such works give preference to and engage such competent workmen of the class required as may be bona-fide residents in the parish of Beckenham, and may offer themselves for employment. Payment under the contract will not be made until six months after the completion of the works. Tenders to be sent to F. Stevens, Clerk to the Council.

April 14. **WESTMINSTER.**—Paving work within the jurisdiction of the City Council. Conditions of contract, specification, schedule, and tender can be obtained on application at the Town Clerk's Office, Westminster City Hall, Charing Cross Road, W.C. The contractors will be bound by the contract in the case of all workmen employed by them, to pay wages at rates not less and observe hours of labour not greater than the rates and hours recognised by the Associations of Employers and Employees, and in practice obtained in the district where the work is to be executed. The contractors are prohibited from directly or indirectly canvassing members or officials of the Council in reference to any tender, and the tender of any contractor who does so canvass will be rejected. The contract deeds will be prepared at the expense of the Council, and the contractors will be required, together with two sureties, to enter into bonds for the due fulfilment of their contracts, or, in the alternative, to agree to the retention by the Council, during the period mentioned in the form of tender, of certain moneys. Each tender to be addressed to "The Town Clerk, Westminster City Hall, Charing Cross Road, W.C." Tenders may be placed by, or on behalf of, tenderers in a locked box at the City Hall, provided for the purpose.

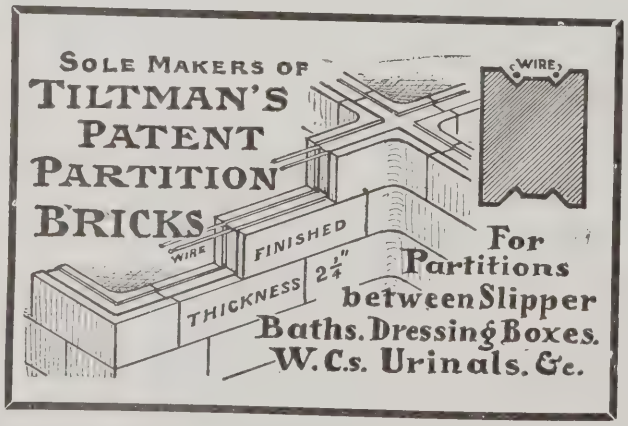
No date. **BATH.**—Supply of best basalt granite, black rock mountain lime, and other approved hard stone, and in the hauling of the same on to the various roads in the district, and for the supply of workmen's tools and other materials as set out in the forms of tender, for the R.D.C. Forms of tender may be obtained from R. H. Whittington, 5, Old King Street, Bath.

MISCELLANEOUS.

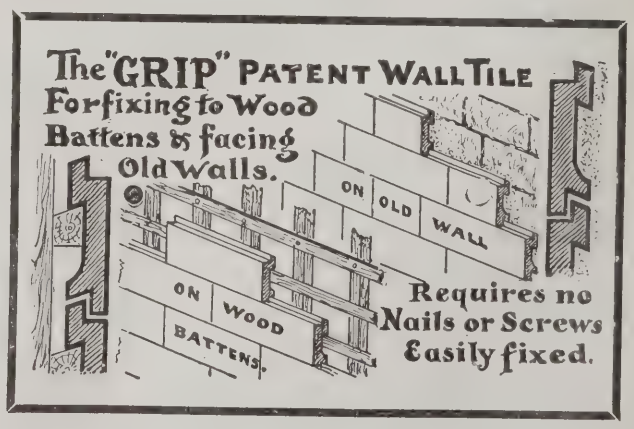
March 30. **BELFAST.**—Supply of about 270 pieces of Riga timber, for the Belfast Harbour Commissioners. Particulars may be obtained from the harbour engineer, W. Redfern Kelly, M.I.C.E., to whose entire satisfaction the timber is to be supplied. Tenders to be addressed to W. A. Currie, Secretary, Harbour Office, Belfast.

March 30. **LEIGH.**—Supply of 5,658 square yards or thereabouts of perforated earthenware floor tiles, for the bottoms of six percolating filters, to be constructed at works off Mather Lane, Leigh, Lancashire, for the Sewerage Board. Conditions, specification, and form of tender can be obtained from Banks, Fairclough and Stephen, A.M.I.C.E., Leigh. Tenders to be delivered to D. Schofield, Clerk, Town Hall, Atherton, near Manchester.

March 31. **DELPH.**—Provision of two folding partitions at Delph Council School, for the Education Committee. Specifications may be had from Edgar T. Woodhead, Divisional Clerk, Huddersfield.



March 31. **LINTHWAITE.**—Asphalting the girls' and infants' playground at Linthwaite Central School, for the Colne Valley Education Committee. Specification may be had from Edgar T. Woodhead, Divisional Clerk, Huddersfield.



March 31. **WIMBLEDON.**—Repairs to and reglazing of the roof of the reading room, for the Wimbledon Public Library Committee. Specifications and plans can be seen on application at the library. Tenders to be delivered to Henry Wm. Bull, librarian.

April 1. **HOYLAKE.**—Supply and delivery for the period ending March 31, 1911, of:—Kerbs, channels, setts, cement concrete flags, macadam, chippings, Portland cement, and stoneware sewer pipes, for the U.D.C. Specifications and forms of tender may be obtained upon written application to the engineer and surveyor to the Council, District Council Offices, Hoylake. Tenders to be delivered at the office of Roderick Williams, Clerk to the Council, District Council Offices, Hoylake.

Penny-in-the-Slot Architecture. By Fred Torr 253

How the State Encourages Architecture.

Those who cherish the charming idea that we are becoming a nation of art-lovers should be prepared to suffer many rebuffs. They could hardly have recovered from the shock of the announcement that the New Gallery had gone the way of the Grosvenor—the latter having but a dubious immortality in Gilbert's rhyme about "A greenery-gallery Grosvenor Gallery foot-in-the-grave young man"—when their optimism received another severe assault—if (which is perhaps more than doubtful) they read the Parliamentary intelligence, in which it is recorded that Lord Claud Hamilton asked the First Commissioner of Works whether he would consider the expediency of removing the painted wood hoarding which had for so many years disfigured the stone screen facing the entrance to the Admiralty at Whitehall, and whether he could hold out any hopes of the completion of the towers of the Home Office in Whitehall in accordance with the design of the architect. Mr. Harcourt *had* considered the expediency; also the expense which, he said, "will be considerable, and I am not prepared at this moment to incur it." It seems rather a pity that, for the moment, he did not happen to have the money about him; but one would have thought that, with the Government of the richest country in the world at his back, his credit for a comparatively insignificant sum would have held good. The same pestiferous impecuniosity dictated his answer to the other part of the question: "I much regret," he said, "that financial exigencies will not permit me to undertake the completion of the towers at present." As Mr. Harcourt puts the matter so personally, it is rather difficult to get rid of the illusion that an exacting nation expects him to disburse these trifles out of his own pocket, and that, official salaries being somewhat precarious at the present juncture, he has run rather short of small change. But is this notion one whit more farcical than the plain fact that the great British Government cannot raise the wherewithal to complete its Home Office, nor even to take down a disfiguring wooden hoarding? The attitude of the British Government—of any British Government—towards architecture has seldom or never been otherwise than mean and contemptible. Mr. Harcourt, who is certainly one of the most sympathetic First Commissioners we have ever had, and who, moreover, is blessed with a very keen sense of humour, no doubt realises the absurdity and humiliation of the position quite as keenly as the most caustic of his critics, and we are very sorry for him; but we are still more sorry for the almost complete indifference with which his extraordinary confession was received. The whole thing is only too typical, we fear, of the national apathy towards art and architecture. Could such a shameful revelation of utter ineptitude have been made in any other country of first-rate importance without exciting a storm of righteous indignation?

Merulius lacrymans.

Some time ago, in commenting upon a law case in which a builder and an architect were cast in heavy damages because they were held to be responsible for the ravages of dry-rot in a building upon which they had been engaged, we commented upon the absolute helplessness of the victims, and we suggested that steps ought to be taken to protect architects against liability for circumstances over which they have no control. We thought that, as a first step towards this very necessary measure of justice, the R.I.B.A. would do well to institute a searching scientific and practical inquiry into the natural history of dry-rot, so as to place itself in a position to make an authoritative pronouncement on the subject, which should serve to fortify the architect against the immediate causes as well as against the remote consequences of this insidious plague. The Institute has at length issued a circular upon the subject, which we have reproduced in another part of the present issue. We regret that the Institute has not seen fit to deal with the matter more thoroughly. Instead of conducting or instigating an exhaustive investigation, the Institute contents itself with publishing a few extracts from a leaflet issued by the Board of Agriculture and Fisheries in October, 1909 (which was dealt with at the time at considerable length in this Journal), with the addition of a few more or less colourless and anæmic observations, which merely leave the question as it was found. Nothing is added to the architect's knowledge of the subject; and the deduction from the data, that "these are conditions over which architects have obviously no control," is but little likely to strengthen his hands in defending an action for damages. The gist of the whole matter is that when dry-rot causes injury to property the aggrieved client has not much difficulty, in the present state of knowledge or of ignorance in the matter, in convincing the judge and jury that, since he has suffered material injury, he is entitled to compensation. Yet the parties who are called upon—possibly to their own ruin—to pay him that compensation—are as innocent of the cause, and as helpless against its operation, as he is himself. We had looked to the R.I.B.A. for strong insistence on the architect's point of view, and for a consequent amelioration of his present unfortunate position in the eye of the law, and we must confess to considerable disappointment at the Institute's feeble statement of his case and half-hearted championship of his cause.

The Aggressive Cemetery.

The architectural amenities of Edinburgh are threatened. The Dean Cemetery is to be extended northwards to the Queensferry Road, "that old thoroughfare of traffic to and from the North," which is to be faced with a length of wall 10ft. high. The Dean of Guild Court has consented to the scheme, merely stipulating that the wall shall not be of the prison or barracks type, but shall possess "architectural features." These, no matter how artistically they may be designed, will not compensate for the view which the wall will shut out. As a writer in the "Scotsman" comments, "It does not appear at all probable that any available architectural treatment can to an important extent mitigate the essential objections to a structure that must, in defiance to all the canons of taste, shut out light and destroy the sense of proportion and perspective belonging to an admired city vista and promenade." It is, by the way, one of the ingenious theories of those who like to "account for things" that because any kind of building certainly shuts out light and air and perhaps obliterates a vista, its builder is under a moral obligation to make what compensation he can afford by making his structure goodly to look upon. It is suggested that, instead of the proposed boundary wall, ornamental railings backed by trees and shrubbery should be substituted. This were to choose between two evils; and there must be many persons who would prefer to have the often æsthetically hideous intimations of mortality—tombstones and more aggressive memorials—quite effectually screened off from the public gaze. The cemetery difficulty is one

that is going to give the town-planner a great deal of trouble, because it is very inconveniently entangled with strong sentiment. It is mainly sentiment that, from the days of Sir Thomas Browne's eloquent advocacy of "Urn Burial," has prevented the general adoption of the only rational and sanitary system of disposal of the dead. In the present case, however, sentiment is as yet on the æsthetic side of the argument, and perhaps it would be possible to make an effective use of the Town Planning Act in preventing the undesirable encroachment.

Ensemble and Detail.

The town-planning spirit is being infused into writers in the newspapers. For example, an annotator of "Current Topics," dealing with projected developments in Fitzalan Square, Sheffield, does not "think the matter ought to be treated" in a "haphazard, piecemeal, penny-number fashion. Let us consider first," he says, "whether we want statues at all. Then whether one, six, or a dozen would best fit in with the general scheme. . . We want the thing to be treated from the point of view of the Square first. If we leave it to the fantastic imagination of our councillors, we shall have it resembling the work-yard of a monumental mason." This writer, for all that his language is so ruggedly picturesque, evidently has (to adopt the courtly phrase of Henry the Eighth) "the right sow by the ear." He cares more for the ensemble than for the detail, and thereby manifests that he is of the rapidly growing band in whom the leaven is beginning to work. A statue may, and it will, be a separate ecstasy, but at any rate it must bear itself modestly in conformity with a general scheme. One need not go all the way with Ruskin in his saying, with all the emphasis of italics, that "*a great architect must be a great sculptor & painter,*" which is as extravagant as his further engaging proposition that "in modern days we have no architects"; but it is clear that the decision as to whether a statue, or a dozen statues, should or should not be put up in a square should not rest with a town council, but with a committee of taste, on which both architects and sculptors should be adequately represented. It is probably some such idea as this which the Sheffield writer intends to convey. It is encouraging to find that writers of his stamp are popularising the subject of town planning.

Conditions of Contract.

The conditions of contract relating to proposed new council schools at Waterloo, Liverpool, having been considered unsatisfactory, the Lancashire, Cheshire, and North Wales Federation of Building Trades Employers issued a circular strongly advising members not to tender for the work. Upon this subject we are now in receipt of a copy of a further letter, from which it will be seen that the matter is in a fair way towards settlement. The letter is as follows:—

"*Lancashire County Council.*

Council Schools, Waterloo, Liverpool.

Conditions of Contract.

"Referring to my circular letter of the 14th inst., in which, at the request of the Federation, you were asked not to tender for the above, I have pleasure in informing you that Mr. Henry Littler, the County Architect, invited the Liverpool Association to send a deputation to Preston to meet Mr. Harcourt E. Clare, the Clerk to the County Council, and himself, to discuss the objectionable clauses. The deputation attended at Preston and were successful in practically getting all the objectionable clauses removed. Mr. Clare is going to redraft the conditions of contract, and submit same to this association for consideration. With regard to the particular job at Waterloo, Mr. Clare has written to the Education Authority at Waterloo advising them not to open any tenders that may have been sent in, and to advertise for tenders later on, after the conditions of contract have been drawn up and agreed to by this association. I may say that Mr. Littler informed us that the local Education Authority had already agreed not to open any tenders that may have been received. You will see from the above that the result of the action taken by the Liverpool Association is highly satisfactory." Here, once more, we have very gratifying proof of the efficacy of sweet reasonableness when supported by prompt and energetic corporate action. Observation convinces us that many corporations, in issuing unsatisfactory conditions of contract, are merely following a precedent which has been allowed to become established through the former lack of the means of organised representation among builders; and that, in most instances, all that is required is a temperate but firm statement of the grounds of objection. Architects will note with interest "the sincerest form of flattery" implied in this application of a method which their Institute has often employed with similar signal success.

Gothic and Stained Glass.

The colour question being specially topical just now, it is interesting to glance at a fascinating phase of it which is dealt with by "L. March Phillipps" in an article on "Stained Glass Windows" contributed to the current "Contemporary Review." The writer delves fairly deeply into the origin of things. What, it is asked, are the motives which underline mediæval strenuousness? And the answer is supplied that the chief and common motive is an extraordinarily vivid consciousness of the significance of materialism. Hence mediæval or Gothic art is remarkable for its extraordinarily vivid representation of the life it proceeded from. The soaring lines and needle-like spires, with their impulse of actual ascent, are an emphatic expression of literal-minded piety. Similarly significant is the "note of strange, deep colour, solemn and dreamy," of the Gothic interior. "No one can submit to the influence of one of the great French interiors without perceiving that its total emotional effect was the end aimed at and steadily kept in view." By way of Venice, the East "darted into the heart of Europe a motive that was to produce great effects in European art," and that motive was "the recognition of colours as in itself a sufficing artistic ideal." This is the secret of Venetian colour—it is used in an Eastern way, not to define form, but for its own sake. The writer thinks, therefore, that between stained glass and Gothic architecture there is a certain incongruousness of idea, which is precisely the same in character as that which seemed to exist in mediæval life itself—"between its strenuously active impulses and the mystical contemplative instinct which so strangely haunted it." Altogether the article is a feast of fine things, and should not be missed by the architect who does not disdain an occasional stimulus to his æsthetic emotions.

IMPORTANT ANNOUNCEMENT.

Next week's issue of the Journal will be the first number of a new series, under the title of "The Architects' and Builders' Journal." As we have already announced, Mr. H. H. Statham, F.R.I.B.A., who is certainly the *doyen* of architectural editors, will henceforth be associated with the editorial conduct of the Journal, which will regularly include contributions from his pen. The number of pages will be greatly increased, there will be more illustrations, the paper will be of better quality, and the typographical arrangement and general appearance of the Journal will be greatly improved. We believe that this forward movement will indisputably establish our claim that the "Architects' and Builders' Journal" is the most enterprising class periodical in existence, and that it is the leading organ of the architectural profession and the building trades. Indeed, our ability to take this important step in advance should speak eloquently of the position of influence to which the Journal has attained. To maintain and improve that position, neither pains nor expense will be spared. The high esteem in which the Journal is everywhere held is our incentive to further strenuous endeavour, and we feel every confidence that the new departure will be crowned with still greater success.

NOTES AND NEWS.

Mr. E. T. Hall.

The Presidents, Vice-Presidents and Council of the R.I.B.A. have entertained Mr. E. T. Hall at a complimentary dinner as a mark of appreciation of his services to the Institute. Mr. Hall has been a strenuous worker in connection with the arduous labours of the new Royal Charter. The new by-laws, made under it, will, ere this appears, have probably received the assent of the Privy Council.

* * *

Paisley Abbey.

At a recent meeting of the Paisley Town Council a letter was read which had been received from Mr. James H. Dunn, The Mound, Castlehead, with reference to the improvement of Paisley Abbey surroundings. In the letter Mr. Dunn stated that the improvements carried out in Paisley during recent years had been most noteworthy. There was, however, another of some importance in prospect—he referred to the demolition of the old buildings which obstruct the view and mar the grandeur of the Abbey. He understood the Council desired to acquire the property in Smithhills which alone remained to enable them to open up the entire Abbey frontage to the street, and he had therefore pleasure in offering the Council the sum required to meet the purchase price (£600), so that this part of the scheme at least might be proceeded with in the course of next year.

* * *

Reinforced Concrete Sleepers.

The reinforced concrete railway ties invented by Mr. L. J. Riegler, of Pittsburg, placed on a section of the Pennsylvania lines, where the traffic is heavy and the trains are run at high speed have in two years shown no signs of deterioration. The tie is a concrete block internally reinforced with two 1½in. rods extending throughout its length, one near the top and one near the bottom. The sides are encased with ⅜in. steel, bent in channel shape, and lapping over on the top and bottom of the tie about 1½in. Prongs projecting from the laps are turned into the concrete, and the steel sides are further secured by three flat straps across the top and bottom, bolted to the sides to prevent

them from spreading. To take the wear of the rails, plates are set in the top face of the tie. These are formed with recesses to receive the base of the rail, which is secured with two 1in. bolts. Where the rails are used for signal circuits, or where for other reasons it is desired to have them insulated from the ground, the lap of the side pieces is cut off beneath the tie plates and bent into the body of the concrete. The ties are 8½ft. long, 12in. wide, and 7in. thick, and owing to their larger bearing area, 15 of them suffice where 18 standard wooden ties would be required.

* * *

New A.R.S.A.'s. Two new Associates of the Royal Scottish Academy were elected recently to the Associate class:—Mr. Fiddes Watt and Mr. John Duncan, both painters, of Edinburgh. Mr. Watt, a portrait painter, is a native of Aberdeen, and studied at the Academy in Edinburgh. He is at present engaged on two presentation portraits, those of Professor Ogston, of Aberdeen University, and of the Rt. Hon. R. B. Haldane, M.P., for the Benchers of Lincoln's Inn. Mr. Duncan comes from Carnoustie, Dundee, and studied in Germany, being afterwards engaged in an educational position in Chicago. His work has been mainly in mural decoration.

* * *

The Flora Bust. A further stage has been reached in the controversy over the supposed Leonardo da Vinci bust purchased by Dr. Bode for Berlin. An analysis made by Dr. George Pinkus of a sample of wax from the interior of the bust shows that the wax is a composition of lac, spermaceti, and beeswax. This composition, Dr. Pinkus points out, is identical with that used by Richard Cockle Lucas in busts that are his undoubted work; and from this he concludes that the Flora bust is the work of Lucas and not Leonardo da Vinci, more particularly as spermaceti was not known before the year 1700. It is needless to say that Dr. Bode does not admit the accuracy of this analysis, or even that the wax analysed by Dr. Pinkus came from the Flora bust, though from the particulars given there seems no doubt as to its authenticity. The statement that spermaceti was not know before 1700 is, however, disputed in several quarters, and would seem difficult to uphold. This controversy has had its uses, perhaps, in exposing much of the hollowness of modern art criticism, which is more concerned with names than with merit. It is not denied now that the "Flora" bust is a great work of art; but only the chance attribution of the work to one of the Great Masters has proclaimed the fact.

* * *

The Roman Villa at Northfleet. The excavation of the Roman remains of Ebbsfleet Pleasure Ground in Northfleet, which has been interrupted by the winter to some extent, has resulted in some important discoveries. It has been found that about 2ft. below the foundations another building exists. Although nearly 400ft. of the foundation walls of the upper building has been uncovered, nothing can yet be said regarding the nature of the structure existing below it. When the work was first undertaken it was not thought that it would prove so extensive. The discoveries, however, although they have greatly increased the labour and the cost, which is being borne by the Associated Portland Cement Manufacturers (Limited), under the supervision of Mr. W. H. Steadman, have immeasurably raised the value of the antiquarian knowledge to be derived from the work. A valuable "find" is a large kiln built entirely of blocks of chalk lined with red clay, burnt through the process of firing to red brick. Buildings erected wholly or partly of blocks of chalk are to be found in the chalk district dating back to the Norman period, or even earlier, and Roman kilns built partly of chalk are comparatively common. This new kiln is uncommon, on account of both its material and its size. Coins, iron, and pottery ware have also been found.

Building on Forecourts. Correspondence in a London newspaper calls attention to the progressive uglification of London by the practice of building on forecourts, by which, it is complained, many London streets have been narrowed and spoilt. Some contend that if these forecourts are to disappear, it would be better to "take them in" by widening the roads.

* * *

The Late Sir Thomas Drew. As an addition to the short note we published recently we are enabled to give, by the courtesy of "The Irish Builder," a list of the Sir Thomas Drew's principal works:—The new Cathedral, Belfast; the Ulster Bank, College Green; Messrs. Atkinson's premises adjoining the bank; the graceful church of St. Kevin, South Circular Road; Messrs. Robert Smyth and Co.'s premises in Stephen's Green; Clontarf Presbyterian Church; the beautiful new church of Maralin, Co. Down; the restoration and practical reconstruction of Waterford Cathedral; the Trinity College Graduates' Tercentenary Memorial Building; alterations to the Library and Reading Room of Trinity College; the spiral staircase to the organ chamber of St. Patrick's Cathedral, erected in 1901 at a cost of £11,000; the fine Law Library of Ireland at the Four Courts, Dublin, for the Honourable the Benchers of the King's Inns; the Rathmines Town Hall; restoration of Coleraine Church; improvements at St. Nicholas' Church, Galway; very large additions to Lough Rynn, Dromod, Co. Leitrim, for the Hon. Colonel Clements, D.L.; additions to Coolarigan, Kilcock, for Mr. R. M. Wilson; additions to Currygrane, for the late Mr. James Mackey Wilson, D.L.; additions to Killagree, Co. Kildare, for Colonel St. Leger-Moore, C.B.; additions to Knockrobin, near Tullamore, for Colonel Biddulph, D.L.; additions to Castle Archdale, Co. Fermanagh, and a host of other works, large and small, on all of which he brought to bear great skill and refinement, and an intensely painstaking measure of care.

HUNGER HILL, COOLHAM, SUSSEX: THE DRAWING-ROOM FIREPLACE. E. TURNER POWELL, F.R.I.B.A., ARCHITECT.

The Zona Monumentale.

The answer given by the Minister of Public Instruction to an Interrogation on the subject of the Zona Monumentale shows that there is little hope of any help from that quarter. Signor Daneo airily dismissed all the criticisms offered to the work of the Commission. They were the outcome, he said, of a false spirit of æstheticism and snobbishness. Italian ideas should be more manly and better balanced. It is difficult to understand why the preservation of ancient monuments of Rome is snobbish or that it is more manly and better balanced to sweep them away. Perhaps modern Italy is tired of its illustrious past and its illustrious art.

* * *

Greater Berlin.

Plans for a "Greater Berlin" have just been worked out as the result of a prize competition between leading architects, builders, and town planners. Prizes of £1,250 each have been awarded for schemes which provide for three generations into the future and contemplate the Berlin that will be in the year 2000, which is fixed as the period when the capital will teem with a population of 10,000,000. It is proposed to avert the evils of such an immense population by a far-sighted plan to regulate the construction of street buildings and parks so carefully that overcrowding will be practically impossible.

* * *

Gourock and Greenock.

The workers in the Woolwich Torpedo Factory who are to be transferred to the new factory at Greenock are by no means satisfied with the housing accommodation to be found there. A deputation of the men has just paid a visit of a week's duration to the Greenock district. The delegates said the state of things in the Greenock district, compared with their Woolwich and Plumstead surroundings, almost appalled the delegates. Many of the so-called houses offered to the men were unfit for habitation, and one delegate considered that they should be ruled out of the consideration of Arsenal workmen. The bare-footed and bare-headed children in the streets were a pitiful sight. Staircases and "closes" in common occupation were objectionable. There was practically, so it is alleged, no housing accommodation in Greenock within walking distance of the factory. With regard to Gourock, the suburb of Greenock—the town was much cleaner, but there was no housing accommodation at present. The deputation felt that none of the Woolwich people would care to live in any of the houses at Greenock that were to let for less than 8s. per week. Strong objection was taken to the "holes in the wall" recesses in the living rooms, in which Scottish children sleep. The deputation viewed with serious alarm the proposals of the Admiralty to take the men down in large batches, and strongly urged that all possible means should be adopted to ensure that the rate of transfer shall never exceed the new accommodation which is to be provided by local garden city associations and builders.

* * *

The Sensitive Lawyer.

The curious sensitiveness of the modern lawyer to draughts and noises is the subject of comment by the "Newcastle Chronicle," which wonders "whether it is the architects who have lost their skill or the big-wigs who are becoming unduly sensitive." "Though," says our contemporary, "they possess buildings of far greater magnificence than any that were known to their fore-elders, yet they grumble about draughts and noises as though our splendid apartments were veritable caves of the wind. The judges have had many hard things to say about vagrant currents in the law courts, and even bishops are inconvenienced by 'cauld blasts' in the middle of their backs. At the Old Bailey, however, we get a boomerang echo. According to Mr. Marshall Hall, it not only 'returns and strikes you on the head,' but also mocks you like a laughing jackass.' Now that the High Courts of Justice is being extended, one hopes the similar evils may be avoided." Yet it is not so long ago that judges were complaining about the stuffiness of their courts, and ordering all the windows to be opened, to the evident discomfort of the other occupants. One judge, if our memory does not play us false, even went so far as to break a window which could not easily be opened. The explanation will be found, we think, to be a matter of personal predilection. Observation has shown us two classes of brain-workers and deep thinkers, those who do their best work amid a free play of air-currents; in fact, under the stimulus of draught; and those who cannot settle down to work comfortably unless they are quite warm, and the surfounding conditions are, to put it mildly, sultry to a degree. We have come into contact with a great many men in each class, and whether contrary to accepted medical opinion or not, we are prepared to vouch for the accuracy of our statement. But the lot of the poor architect who has to design buildings which may be used by men of either class is indeed a hard one.

* * *

Putney Vale.

As the result of a deputation to the Lord Mayor, a meeting will be held at the Mansion House on April 26, to secure financial support for the scheme for the extension of Wimbledon and Putney Commons. The land it is desired to purchase extends from Putney Vale to Coombe Bridge, and through the greater part of it runs the picturesque Beverley Brook. It was stated by a member of the deputation that there was a scheme for the erection of some 10,000 houses to the south of the vale.

* * *

The Forth Bridge.

Rumours have recently been in circulation in regard to the Forth Bridge. The statements were to the effect that under the strain of the large Atlantic type of engines, which the North British Company built four years ago plates in the bridge were starting, that in other places it was exhibiting unexpected signs of decay, and also that it was swaying more than it did for many years after its completion. At the recent meeting of the North British Railway Company an authoritative statement was made by Lord Dalkeith, the chairman, who said that any statements about the insecurity of the Forth Bridge were purely imaginary. The bridge was in as perfect a state as it was possible for anything to be in. A speed limit had been fixed for crossing the bridge, but there was nothing wrong with the structure. There was no engineering structure in the world in a more perfect condition.

* * *

Vanstead Flats.

People who visit Wanstead Flats during every season of the year will find that a welcome transformation has been made in the appearance of that huge playground. For months past large gangs of men have been hard at work in converting the barren surface into turf-land, and the result will prove a great boon not only to cricketers and others, but also to the general public. Some dozens of acres have been treated and scores of men have been found employment. The work has been undertaken by the local Distress Committees, with the assistance of the Local Government Board.

* * *

Land at Salisbury Plain.

Mr. H. M. Cobb, F.S.I., sat as arbitrator in the case of Holloway v. the Secretary of State for War, a claim for compensation in respect to 913 acres of land at West Lavington, compulsorily acquired. A valuation of £24,617 was advanced on behalf of the claimant, taking land at £15 per acre, with 25 per cent. for compulsory sale and consequential damage at £7,498, including £2,000 in respect of the Manor House, which had been enlarged and improved by the owner, and would be prejudiced by bringing the firing point of the artillery ranges within 55 chains of it. The case was adjourned.

* * *

The Attractive dwelling.

A correspondent, with the coming holiday season evidently in mind, sends to "The Welsh Coast Pioneer" a suggestion which, while exhibiting the harmlessness of the dove, shows not a little of the wisdom of the serpent. Briefly his idea is that the holiday maker is attracted to the houses which have a nice little flower garden; *ergo* those householders who desire to let their rooms will do well to first cultivate their gardens. He quotes the late Henry Ward Beecher on the point. "But no matter how rude the cabin, or rough the surroundings, if we saw that the window held a little trough or box for flowers, and that some vines or climbing plants twined about strings let down from the eaves, or verandah, we were confident that there was some taste and carefulness in the log cabin. A patch of flowers came to signify to us, kind people, clean beds, and good bread."

SKATING RINK, FINSBURY PARK, N.

This building is erected on the site of the old tram sheds and stables, and leased from the London County Council. The site was cleared in two weeks, and the whole of the building erected in 8 weeks time, two weeks less than contract time. The buildings are of a permanent character, and finished in quite a different manner to those usually erected for skating purposes. The building externally is in yellow stocks with red quoins and plaster enrichments. Internally the main rink annex is finished with fibrous plaster, Georgian in character, all modelled to the architect's design. The floor of the rink is in rock maple upon felt and joists, and the space outside the rink and also to galleries finished in special paving, which allows the skaters to patronise all parts of the building on their skates. The whole of the lavatories and sanitary fittings are specially selected for the purpose required. The lighting has been specially considered, and the large electroliers are so designed to allow of an interval arc lamp being used, and are all worked in series. Special limelight stands have been arranged for display purposes. The main entrance has marble floor and Fassio marble wall pavelling in Sienna and Pavanatso with enriched frieze and ceiling. The internal wood-work is in oak and American whitewood, stained and polished. Messrs. F. M. Thompson and Sons, of Nottingham and Louth, were the general contractors, and the following are some of the contractors and specialists employed upon the building:—Bricklaying, mason, plumber, slater, plastering and glazing, Messrs. Jones and Andrews, Beckenham; ornamental plasterwork, Messrs. DeJong and Co., Camden Town, London; ironwork and roofing, Messrs. Richard Moreland and Co., Goswell Road, E.C.; the glazing has been done on the special system of Messrs. Helliwell and Co., Brighouse; marble work, Messrs. Fassio, Ltd., 59, Chancery Lane, W.C.; sanitary fittings, Messrs. Doulton and Co., Lambeth; electrical work, Messrs. Golding, Hackney; electrical fittings, Messrs. Evered and Co., Drury Lane, W.C.; the whole of the arrangements for warming, Messrs. J. F. Phillips and Son, 21, Victoria Street, London. The general foremen were, Messrs. Ward, Williams and Rabbits, and the clerk of works, Mr. Lewis. The architects are Messrs. Fair and Myer, A.R.I.B.A., 39, Furnival Street, London, who have carried out various other rinks in London and in the provinces.

CASTLES IN THE AIR.

By C. F. A. VOYSEY.

Mr. Voysey at the outset of his lecture at the Carpenters' Hall informed his hearers that he would give them something which was entirely dependent on their mental vision. Many a time, he said, have been urged from this hall the possibilities and limitations of materials to craftsmanship. Possibilities and limitations both physical and spiritual must be as interesting, and underlie our understanding of everything. Has it not been man's law of beauty and fitness which has ever acted as his lodestar, guiding him onwards and upwards? All we can say or do, to help to stimulate beauty, helps the advance of mankind. Shall we bewail our position; blame the government—anathematise the machine, and dukes—shall we rouse ourselves into passionate antagonism against what we believe to be our "monster"? We think the world would be a paradise if our particular monster were beheaded. It is a mercy that men can never be able to think alike. The world would never make any progress if they did. All artists must feel that their great vocation is to create sensibility. Without sensibility we cannot feel refinement. Countless petty annoyances let us see that it is our attitude towards evil which makes it a blessing or a curse to ourselves. We are speaking of our troubles as affecting ourselves and not others. Has ever any craftsman derived pleasure from any work without there was some difficulty in it to be overcome? Difficulties are not members of the same family as troubles. It is more helpful to be able to see a good principle in pain than to run away from it. The craftsman begins by training his hand. Do we not say, when we seen a fine piece of work, "See the master's hand!" By this, do we not mean that he has trained his hand to perfection?

Beauty.

Towards the building our of castles in the air have we not advanced in one condition—the subjection of the material to the spiritual—the power of the soul over matter? We must not lose heart because of difficulties, the measure of our work is taken by the overcoming them. Thought and feeling then must be the mortar with which we bond in course by course the walls of our castles in the air. The study of history teaches us that there is no finality to the development of the human mind. We are all charged with the duty of self-culture or castle building.

Beauty is to be held up for admiration, not forced down our throats. A man must keep up a longing for beauty in all its forms, and so add to the building of castles in the air. They are castles in the air that we can pull down and rebuild as we like, they require no money. Pleasure is only a consequence of goodness; when sought for itself it is a poison. So beauty when sought not for love or religion, but for itself, is a failure. If to please were the sole claim of all art we should not feel the need of greater sensibility, for sensibility is pain. When people are thoroughly abandoned to self and pleasure they lose their sense of beauty. The pursuit of pleasure and a life of ease lead to a sense of mind not suitable to beauty. Ornamentation of architecture like verbosity of literature is a poisonous excrescence. We want moral qualities which are as old as the hills, and never change. These qualities bring forth good fruit under any conditions. These moral qualities are precious materials, and the only ones for our castles in the air. Only what is true can survive time. We have to be looking everywhere for beautiful new materials. Every portion of our castle must be the best of its kind, and then will bear visible record of invisible things. It is the artist's business to find out what makes for law and order. Until we come to realise the blessedness of toil, and the beneficent power behind it, then only shall we see that it is a blessing in disguise and search in it for good. The more sensible we are, the more we shall meet with troubles. Let us not deceive ourselves by going forth as artists, when our main object is to make money, and degrade our art. We must more and more learn to sacrifice body to soul and value giving more than getting. The close attention which we give to the Orders of Architecture and other foreign symbols are in the end useless if we are not castle building all along.

Shun the Ugly and Impure.

We must believe that building castles in the air will lead us to shun all that is ugly and impure. There is a tendency nowadays to specialise in our use of material. This may increase our capacity in the direction which we choose, but it may hinder our mental activity. We cannot be craftsmen until we instil into our homes those mental qualities of Castle Building, and also introduce them into the Beelzebub of business. Corporations are doing their best to turn men into machines, but some companies, notably the Carpenters' Company, are doing their best to encourage those qualities which we are discussing to-night. May we not take encouragement that when history compares us with the craftsmen of the 13th century—those men who always loved their crafts—were all familiar with beautiful legends and angels, as familiar with them as we are with policemen; will it not be considered more credit to us to have battled with the odds than those of the 13th century? The past is too often held up to make us ashamed—instead, we want encouragement to make us do better.

Photo: Topical.

FINSBURY PARK PAVILION AND SKATING RINK: VIEW OF LARGE RINK LOOKING TOWARDS THE ROYAL BOX. FAIR & MYER, A.R.I.B.A., ARCHITECTS.

Roller skating appears now to have become something more than a passing craze, a fact attributable, no doubt, to improvements both in the floors and in the skates. The majority of the skating rinks recently erected have few pretensions to architectural effect. The one illustrated above, however, is one of the latest and most luxurious.

The True and Beautiful.

We are drawn towards our fellow creatures by every atom that is beautiful. Some kind friends will say that our actions fall far short of our castle building, but shall we be better for never building them at all? Some of us spend most of our time on work for others which we hate and detest. Let us remember that it is no shame and disgrace to be doing this. In this, castle building may come as a help. To bemoan and chafe with our lot will help us not, but by determination to see the beautiful and true you will gain strength. We are surrounded by museums full of a heterogeneous mass of objects supposed to help us in our education. How little of it is really beautiful, and how have we gone back from that which is. Is it not because we have served idols and ignored the mental qualities which were necessary to produce them? Castles can be built by those who have never passed out of our country. All the material that is needed for them can be found in hearts and brains, and any nature can undertake them. The material for our Castles in the Air can come to us free—subject to no trades and tariffs. The many troubles which arise out of our daily occupation are the walls of our building. Colour and form and texture seldom appeal to the same mind in an equal degree. Several artists are discouraged when their work is finished because they find that it appeals to one faculty only. The machine has turned our thoughts to material things. We need castle building to help us to revive the spiritual side of our nature, and we believe that the artist while creating the beautiful must breathe into his creation the spiritual nature which will save our nation. As craftsmen we have to study convention. By convention I mean that blind following of customs, but even these sometimes have a practical meaning which cannot be ignored. If we can show that a vermiculated surface can express qualities that are not base, we will admit them for our castle walls, otherwise we will cast them out. We shall not regulate our requirements by money matters. There are many things that it is a pleasure to go without.

SOCIETIES' REPORTS.

Northern Architectural Association.

At a meeting on the 9th inst., Mr. G. T. Brown, F.R.I.B.A., president, presided over a large attendance. Mr. James Forbes, Middlesbrough, and Mr. C. D. James, South Shields, were both elected members. A selection from the prize designs and drawings submitted in the Royal Institute of British Architects' prize competition were on view. In connection with the competitions open to students of the association the assessor's award was read, and it was found on opening the sealed envelopes that the following gentlemen had been successful: — For measured drawings of existing work: Under 21 years, G. E. Charleswood; under 25 years, W. W. Nimmo. Architectural sketches: Under 21 years, G. E. Charleswood; under 25 years, W. W. Nimmo. For the best set of testimonials of study required for the Royal Institute's final examination, Wilfrid Lawson; and for similar drawings for the intermediate examination, Joseph Hill and S. W. Milburn were bracketed together. The Glover studentship, which, subject to certain conditions being fulfilled, carries with it the Glover Medal and a prize of ten guineas, was awarded to Joseph Hill. The annual meetings of the Students' Classes Club and Sketching Club were held, the annual reports adopted, and committees chosen for the ensuing session.

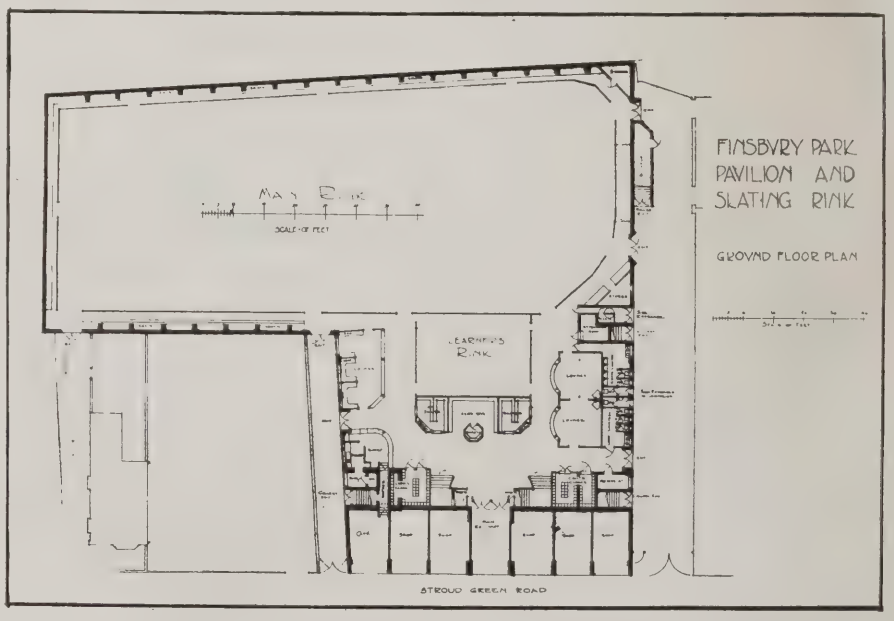
Leeds and Yorkshire Architectural Society.

At a general meeting held on Thursday, March 17th, Mr. Percy Robinson, F.R.I.B.A., occupying the chair, the election of the officers for the forthcoming session took place, the following gentlemen being appointed to the several offices:—As president, Mr. S. D. Kitson, M.A.; vice-presidents, Mr. R. P. Oglesby, and Mr. A. E. Kirk, A.R.I.B.A.; hon. treasurer, Mr. R. Fielding Farrar, A.R.I.B.A.; hon. librarian, Mr. Fredk. Musto, A.R.I.B.A.; hon. secretary, Mr. R. W. Thorp, A.R.I.B.A. To the Council, Mr. C. B. Howdill, A.R.I.B.A., Mr. J. F. Walsh, Mr. G. F. Bowman, Mr. H. A. Chapman, F.R.I.B.A., Mr. J. C. Proctor, A.R.I.B.A., and as associate member, Mr. W. Whitehead, A.R.I.B.A.

In proposing the election, Mr. W. H. Thorpe, F.R.I.B.A., acknowledged the society's indebtedness to Mr. Percy Robinson, the retiring president, who, he said, had done yeoman service on its behalf, and whose untiring efforts towards the furtherance of its aims were appreciated by every member, sentiments which were endorsed by Mr. H. S. Chorley, M.A., who seconded the proposal. Mr. Kitson then read his paper on the life and work of "Carr, of York," an architect who flourished during the eighteenth century, and to whose hand so many of the Yorkshire Georgian mansions owe their stolid simplicity. He is perhaps best known as responsible for the erection of Harewood House, where he came in contact with the brothers Adam, a circumstance which considerably affected his subsequent work. Commencing life as a mason, with the traditions of several generations of mason forbears, he was one of the last links with the mediæval past when the draftsman development.

THE MEDIÆVAL HOUSE.

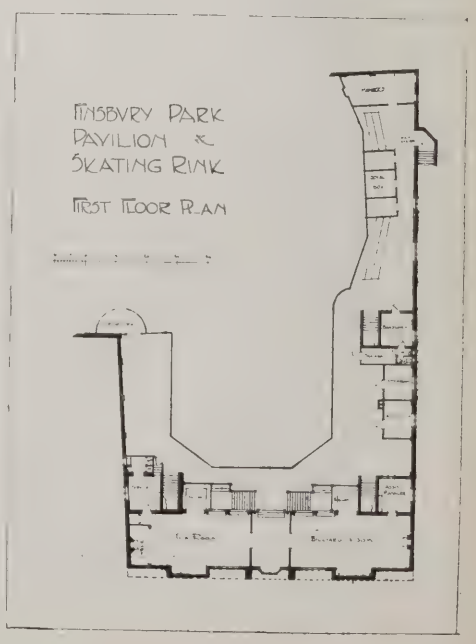
By J. A. GOTCH, F.R.I.B.A.*



Mr. Gotch created an atmosphere for his subject by a prefatory recapitulation of the story of Gamelyn and his brother, from the pages of Chaucer.

The interest of that tale lay in the picture which it incidentally portrays of a mediæval house; how the house had to be planned to resist violent attacks, and how jealously its narrow entrance had to be guarded. We see the courtyard with its well. We see the hall and its screen with the pantry close at hand; the cellar where Gamelyn replenished his wasted strength; the turret to which his brother fled, the solar from which he emerged to upbraid the headstrong young man. Let us see how far we can substantiate this mental image from some of the mutilated houses that have come down to us.

Some Surviving Mediæval Dwellings.



The accommodation in a mediæval house was not extensive. Haddon is not typical in this respect; it was the home of a very considerable personage, and much above the average in point of size. But imagine a smaller Haddon and you get a good idea of a mediæval house. There is the main gatehouse, inaccessible to all but people on foot or horseback; there is the courtyard, and beyond it the hall; there are turrets and

* Abstract of a paper read to the Architectural Association.

HUNGER HILL, COOLHAM, SUSSEX.

This house is built partly of local stone, that under the three gables being Sussex marble quarried from the estate. All the external woodwork is of oak, the upright framing being of oak 4½in. thick. The whole of the roofing is of old stone heeling. On the west side there is a paved walk of Sussex marble roughly quarried. Oak shingles are used over the garden entrance, and the projecting bay of the hall is built entirely of oak, the corner posts being 12in. square with heads and sills to correspond. The oak room is panelled entirely in oak, and the chimney-piece is of sandstone with oak beam over the opening, and above it a recessed panel in enriched plasterwork. The dining-room fireplace is of Sussex marble polished, the recess being formed of tiles in various patterns. The charm of the house is to a great extent due to the textures of the different materials employed. The architect is Mr. E. Turner Powell, F.R.I.B.A., 25, Queen Anne's Gate, Westminster, S.W.

towers: there are the screens of the hall giving access to the pantry, the buttery, and the kitchen passage; there are several rooms which might stand for the spence; and the solar, or principal room of the lord, is represented by the quaint panelled parlour.

Stokesay Castle is perhaps nearer to Chaucer's description. The gatehouse, it is true, was rebuilt in Elizabeth's time; but restore the walls which abut against it to their ancient height and you get just such a courtyard—well and all—as that across which Gamelyn chased the porter. The hall, too, is such a one as might have been filled with the abbots and priors and men of holy church, who, full of meat and wine, mocked Gamelyn in his distress, and were so handsomely cudgelled in return. At Stokesay the fire was placed upon a hearth in the middle of the room, as it was likewise at Penshurst; at Haddon, on the other hand, the equally frequent alternative was adopted of placing it in a recessed fireplace with a proper smoke-flue.

Stokesay has no little turrets, but it has a large strong tower, where the false brother might have felt safe. It has, too, an outside staircase, up which he might well have fled to a loft; it has a solar with windows looking into the hall; and at each end of the hall is a room which might have been the spence.

The Solar Chamber.

The solar was originally the small private room of the lord—probably, in quite early houses, the only private room of the house; the hall itself being the day-room and night-room of the whole household. In Chaucer's time it had grown into a short series of similar rooms, but they were still few in number.

The Kitchen.

One important room which was to be found in every mediæval house, was the kitchen. In early times it was second in importance only to the hall; it was connected to the lower end of that apartment, while the solar was usually attached to the upper end. The kitchen was not infrequently built of wood, or of wood and plaster, a mode of construction which was adopted in the majority of houses, and which accounts for their disappearance. Only a certain proportion of those which were built in stone have survived.

But kitchens were not always built of wood; many of them were very notable buildings of stone. Of early examples there are few, if any at all. But there are several of later times, all of them independent structures connected to the main building by a corridor. Among the more notable are the kitchen of the monastery at Durham, that of the abbey at Glastonbury, that of the house at Stanton Harcourt, and that at Cowdray House. Most of these had several huge fireplaces in the walls, all of them had fine louvres, or ventilating turrets, carried on stone groining-ribs. Stanton Harcourt appears to have had an open fire on the floor, and its louvre is of wood; but the principle is the same in all cases—plenty of fire for cooking and plenty of ventilation for the smoke and smell. These examples were all attached to large establishments; in the case of smaller houses the kitchen was one among the rooms covered by the general roof. Haddon affords a good example of this kind, although it can hardly be considered a small house; circumstances, however, did not allow of a detached kitchen in this case.

The Internal Appearance.

But now, having got a more or less vague idea of the size, the accommodation and the appearance of a mediæval house built of stone, the interesting question arises: How did it look inside?

The only rooms which need detain us in this connection are the hall and the solar. The kitchen, for instance, would be clothed in its own dark livery of soot; the pantry, the buttery, the spence, and other inferior rooms would have bare walls or embellishments of a purely utilitarian character. But the family rooms received a certain amount of decoration, according to the wealth and taste of their occupants. The hall was usually a one-storey structure with lofty walls and an open-timber roof upon which the carpenters had spent their trained skill. It was lighted by windows upon which the masons had spent theirs. The mere elements of its construction, therefore, made it as handsome as a village church. But among the rich its walls were adorned in handsome fashion with beautiful hangings, some being of the most costly kind. Armour and trophies of the chase and of war hung here and there, and at night cast flickering shadows from the light of the fire and of great torches. The smoke eddied about in the upper regions, and finally made its escape through the unglazed windows or the louvre in the roof. Very few windows were glazed, but they were closed by means of wooden shutters, which were painted bright with the glowing colours of heraldry. Some few houses had their windows glazed in part, and Henry III. gave orders for the glazing of some of his with painted glass representing well-known stories, his favourite subject being the parable of Dives and Lazarus.

THE FINSBURY PARK PAVILION AND SKATING RINK: THE LEARNERS' RINK, LOOKING TOWARDS THE ENTRANCE. FAIR AND MYER, A.R.I.B.A., ARCHITECTS.

The Finish of Walls.

The walls were very frequently plastered; and plastering was much more common in houses and churches than the restorers of twenty and thirty years ago seem to have been aware of. The plaster was not laid on thickly and brought to a beautiful even surface; on the contrary, it was quite thin, and showed the wavy surface of the wall. On the plaster were frequently drawn thin lines of colour, as though to represent the joints of stones. In the prior's chamber at Abingdon

Abbey, now a dark hayloft, the enterprising inquirer can still see the original plastering of six and a half centuries ago, marked out with just such lines.

Panelling was another method of covering the walls, or, as it was then called, "seeling." Orders were given by the King in one case to "seel" both the walls and the roof of one of his halls for a certain number of bays, in order to lessen the draughts as he sat on the daïs. Whether the panelling was framed together or merely consisted of boards it is difficult to say; but the examples of XIIIth century panelling are few, if any. The "seeling"—whichever form it took—was painted green and powdered with gold stars.

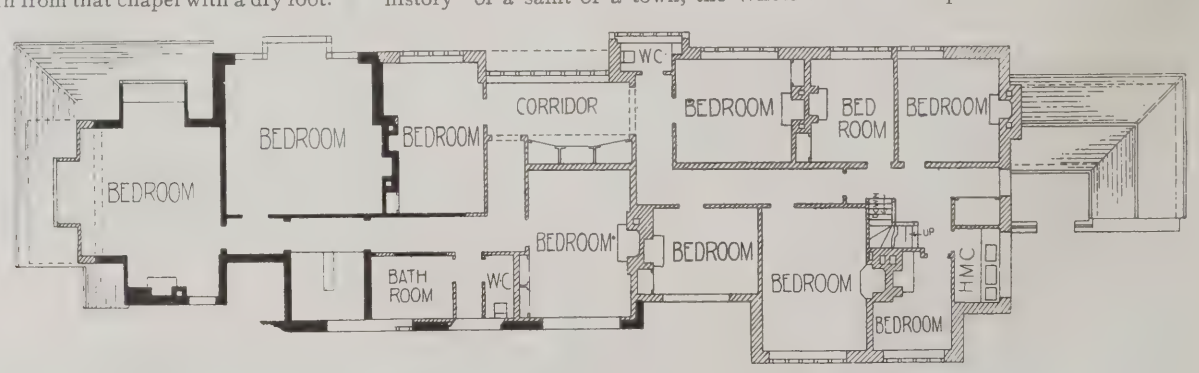
Prevention of Draughts.

There can be no doubt that Henry III., in the XIIIth century, strove to make his houses more comfortable than he found them. Even in those hardy times it was felt desirable to do something to lessen the draughts, to circumvent the weather, and to warm and decorate the rooms. The King possessed innumerable houses, large and small, in the southern and midland counties; and the orders given in respect of them are of great interest. Chimneys were built to many rooms to warm the inner air; porches and corridors were built to check the incoming of the outer air. At Evereswell a porch was made before the door of the Queen's chamber; at Oxford a fair and decent porch was ordered to the south door of the hall, another at Clarendon, and again at Marlborough and Kennington. At Westminster, in the year 1245, Edward Fitz-Otho was commanded to build a porch such as might become so great a palace so that the King might dismount from his palfrey in it at a handsome front. At Woodstock an aisle was made between the Queen's chapel and her chamber so that she might go to and return from that chapel with a dry foot.

In 1238 orders were given to glaze a window of one of the rooms at Westminster so that that chamber might not be so windy as it used to be. In another case two windows were inserted with white glass casements to open and shut; and at Northampton a glass window, which might be closed and opened, was made in the hall opposite the King's daïs, and painted with the figures of Lazarus and Dives.

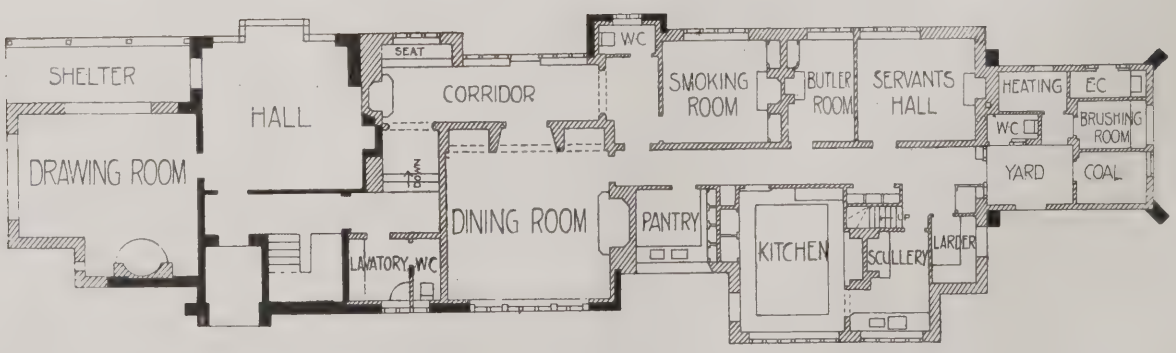
There are several orders for louvres—one for the great hall at Woodstock in 1244; another, four years later, over a hearth of freestone, high and good, in the chamber above the wine cellar of the same house; and yet another in the hall at Winchester, to carry off the smoke.

Decoration.



There are also many orders for decorating the various rooms, one of the most frequent being for the application of whitewash. The tower of Corfe Castle was ordered to be whitewashed externally; the new tower at Winchester to be whitewashed inside and out; the great hall at Clarendon, the tower at Guildford, the hall of the same house, within and without, were to be treated in a similar fashion. The Queen's chamber at London was to be thoroughly whitened internally and painted with roses; a chamber, chapel, and wardrobe at Nottingham were to be whitewashed and pointed lineally—like the prior's room at Abingdon. The favourite method of internal decoration, however, was to paint the walls green, spotted or scintillated with gold. Occasionally pillars were to be painted of a marble colour—so the decorators of twenty years ago had an august precedent for what we consider their enormities. Figure subjects were frequently painted on the walls or on the chimney; the "history" of a saint or a town, the Wheel of Fortune, the four Evangelists, or, once more, Dives and Lazarus. On the chimney of the Queen's chamber at Westminster was depicted a figure of Winter, which, as well by its sad countenance as by other miserable distortions of the body, might be deservedly likened to winter itself. On the wall at Winchester a map of the world was painted.

What would we not give to find some of these things now?



The Discussion.

Mr. Gerald C. Horsley was very much interested in the description of wall painting. It was a matter for regret so few examples remained. Beside the example at Abingdon Abbey he remembered another at the Castle of Coucy in France, where the underside of the stone steps in the circular keep had the joints suggested in coloured plaster with a double line, as against the single line at Abingdon. There still remained a few Saxon towers in England with old plaster on, as at Oakley, in Bedfordshire. He presumed that the practice of exterior plastering and whitewashing was adhered to owing to its cheapness in comparison with stone.

Mr. Leonard Elkington. The question of mediæval furniture was one of some interest—as, for instance, the advent and improvement of the bedstead. The inconvenience of the mediæval house was explained by its being constructed for defence. He desired to know which was the earlier type of chimney—the hooded or the recessed. He believed it to be the latter. The hangings used in these houses were considered an invaluable asset, and were greatly prized by the owners. They were often moved about to grace a gathering, or lent upon the occasion of some festivity.

FIRST FLOOR PLAN

GROUND FLOOR PLAN

HUNGER HILL, COOLHAM, SUSSEX. E. TURNER POWELL, F.R.I.B.A., ARCHITECT.

Mr. H. W. Brittan commented on the resemblance of the mediæval house to the scholastic establishments of the period. Dwellings were often damp; this being, probably, the reason that the solar room was found upon higher ground.

Mr. F. Dare Clapham mentioned that the lecturer had said nothing about site and aspect; but he concluded that houses were usually placed on a hill. In the examples shown the exterior stairs appeared to be roofed in; and he wondered if this was always the case.

The Chairman. Mr. Henry Tanner thanked Mr. Gotch for his excellent paper; and having asked whether the lecturer could give any information as to when wheeled traffic first commenced, made reference to the external whitewashing and wondered if by this white painting was meant.

THE DECAY OF WOOD CARVING.

BY JOSEPH ARMITAGE.

[These extracts from Mr. Armitage's lecture to the Leicester and Leicestershire Society of Architects directly bear on the craft about which he was speaking. But his paper was in the main a racy and interesting re-statement of art principles, in the course of which he put in an eloquent plea for colour architecture, and attacked certain contentions of Professor Blomfield in "The Mistress Art."]

The range of expression open to the art of the wood-carver pure and simple is, of course, limited. His material is perishable and liable to fire. The wood-carver must, from the beginning, realise that he is dealing with a humble material, he must be content to be the architect's poor relation, happy if he can produce what Ruskin called a "pleasing roughness." The great characteristic of wood is the grain. Whether it be straight or twisted into fantastic knots, it puts difficulties in the way of perfectly smooth and accurate finish. Looking at most modern work one feels that the grain spoils the effect, or, to put it in another way, one feels that the work would look better in a perfectly homogeneous substance, such as cheese. One wonders why a man should attempt to produce such marvels of accuracy and smoothness in such a stubborn and wayward material. In mediæval work, on the contrary, one feels that the carver has conquered his material by kindness and judicious give and take, giving it a beauty that is almost human in its blending of imperfections into a harmonious whole.

Wood is distinctly the wrong material for subtleties of expression. But if the carver has something to say and is not merely roughing wood for a living, he can make us feel his delight in nature and in life, or amuse us with his jokes. Only by the crudest symbols can he tell us of the deeper things of life, and only then if he is of the *élite*. His beauty will grow around a core of symbolism, and will be so much the better if it is only a by-product.

But how far is the carver justified in imitating nature? If he is to make us feel his delight in nature, ought he to stop short of exact imitation, give us not only the texture and colour but the smell of the flowers, if he can? What prevented the mediæval worker, with all his delight in nature, making his work naturalistic? Why is it that in all the great periods, side by side with great technical skill, there is a strict convention? The teaching of the tool is the text-book explanation, but the tool would lead one to damnation if one would let it. There is a constant temptation to greater and greater finish and skill in pure craftsmanship, the desire to excel as an executant. Again and again in history we see it struggling with some other power. Norman work developed towards naturalism until checked by the Cistercian reformation, which led to the weird convention of the thirteenth century, through which the naturalism of Decorated work gradually breaks, which again gradually hardens through Perpendicular to the convention of late Perpendicular and the early Renaissance, then to naturalism of Grinling Gibbons, back to convention of the eighteenth century, and so to the Anarchy of to-day. Through it all there was a definite standard or tradition, development was fairly even, and behind it all there was the ideal, towards which it continually returned—the ideal of architectural fitness, the true sense of which was lost with the severance of the craftsman and the architect from the actual building. Now, when the parts of the work are executed in different parts of the country, in separate workshops, it is difficult to keep the units in proper relation, and our work suffers. The architect must paint his picture with ready mixed paint, or he must carefully mix his complete palette before starting the work. There can be little adjustment of values, and therefore less unity.

Photo: E. Dockree.

HUNGER HILL, COOLHAM, SUSSEX: THE DINING-ROOM FIREPLACE. E. TURNER POWELL, F.R.I.B.A., ARCHITECT.

The Lecturer replies. Mr. Gotch observed that walls were coloured white; but he was unable to say exactly with what material. With regard to furniture it was too large a subject to introduce in that paper. He had seen in a châlet in Switzerland a large bed for parents, with drawers under to contain the children. The earliest examples of chimneys were of the recessed type; hoods were added later to assist the smoke to escape. Wall hangings were considered of much importance, and references could be found so late as the times of Shakespeare. He appreciated the remark about the similarity of these houses to schools; they formed a sort of community. The external staircase to the solar room was not at all infrequent. The proximity of water was a strong factor in the selection of a site; but aspect was, he thought, less regarded, though it was desirable to select a prospect that gave a clear view of approaching visitors. He could not say when wheeled traffic commenced, but at the period of the mediæval dwelling it was the custom to carry on pack-horses.

R.I.B.A. AND "DRY ROT" IN TIMBER.

The attention of the Council of the Royal Institute has been drawn to the issue in October, 1909, of a leaflet by the Board of Agriculture and Fisheries referring to the increasing prevalence of the disease known as "dry rot" in timber used in the erection of buildings, and, having taken the matter into consideration, the Council deem it to be in the interests of the public generally to issue some observations thereon.

From the official leaflet the following extracts are taken: —

"Infection with the dry-rot fungus sometimes takes place in the forest when felled timber remains stored there for some time. The first evidence of such infection is indicated by the presence of red stripes in the sawn wood. If such wood is thoroughly seasoned the mycelium present in the red stripes is killed. If the seasoning be neglected or imperfectly done, the mycelium, which possesses the power of remaining in a latent condition for some time, commences active growth when the wood is used in any part of a building where it is exposed to dampness, and this in some cases is unavoidable, as when the ends of joists are built into a wall.

"Under such circumstances dry rot eventually appears.

"On the other hand, the fungus is by no means rare on old beams and boards stored in woodyards, etc., and it is mainly from such sources that spores or portions of the spreading mycelium are introduced into buildings by new wood which has become infected.

"The fruit of the dry-rot fungus presents the appearance of irregularly shaped, flattened, or undulating patches of variable size, adhering by their entire under-surface to the substance on which they are growing. When mature the central portion of the patch is covered with an irregular network formed by slightly raised anastomosing ribs, and is of a rich brown colour due to the enormous quantity of spores which are deposited on surrounding objects under the form of snuff-coloured powder. These spores are diffused by currents of air, or by rats, mice, and insects.

"The margin of the fruiting-patch is surrounded by a snow-white fringe of mycelium which spreads in every direction over surrounding objects, creeping up walls and passing through crevices, the advancing mycelium being supplied with food and moisture from the parent plant growing on wood.

"This food is conducted through cord-like strands which form behind the thin advancing margin of mycelium.

"Owing to this supply of food from a central source the mycelium can extend over stones and other substances not containing food, and thus spread from the basement to the top of a house. Each time the migrating mycelium comes in contact with wood the latter is attacked and a new centre of food-supply is established, from which strands spread in search of other sources of food. The mycelium often forms felt-like sheets of large size that can readily be removed intact. These sheets are white at first but soon change to a pale grey colour—a character by which dry rot can be readily distinguished from another wood-destroying fungus, *Polyporus fomentarius*, even in the absence of fruit, the felted mycelium of the latter remaining permanently white.

"The specific name of *lacrymans*, or 'weeping,' alludes to the power of the fungus to attract moisture from the atmosphere. Under certain conditions moisture is absorbed to such an extent that it hangs in drops, or even drips from the surface of the fungus. This moisture assists very materially in rotting the timber, which afterwards becomes quite dry and friable. Hence the popular name, 'dry rot,' which alludes to the last and most frequently observed stage of decay."

Upon these extracts the Council of the R.I.B.A. comment as follows:—

The depletion of the more matured forest trees resulting in the importation of immature wood is said to be one of the contributory causes of the spread of the disease.

Spores may exist in the earth arising from the roots of trees or other source.

The rapid completion of a house before the materials of which its carcase is constructed have had time to dry thoroughly conduces to the germination of dry rot.

A warm, damp atmosphere surrounding the wood, such as exists under a floor immediately over the ground and in unventilated cellars, is another condition conducing to the spread of the disease.

Although, as above remarked, immature or imperfectly seasoned timber is said to be a cause of the spread of the disease, yet thoroughly matured and sound timber in a warm, moist atmosphere will readily fall a prey if attacked by the mycelium of dry rot, once a spore has been introduced.

It has been proved that the spores of the disease can be carried from house to house on the clothes or tools of workmen, and that wood can be infected from a spore on a carpenter's saw.

From the foregoing it will be seen that the disease may have been introduced (*a*) in the timber, (*b*) from the adjacent earth, and (*c*) accidentally by the importation of a spore. These are conditions over which architects have obviously no control.

NOTES ON COMPETITIONS.

Schools, Kimberworth, Rotherham.

The assessor, Mr. E. R. Robson, has made his award in the limited competition for the proposed higher standard schools and infants' schools to be erected at Kimberworth. Rotherham, for the Borough of Rotherham Education Committee. The design of Mr. J. E. Knight has been placed first, and the design of Messrs. Fredk. Willey and David B. Jenkinson, A.R.I.B.A., joint architects, second; and the premiums allotted accordingly. The higher standard school provides for an accommodation of 300 boys and 300 girls in separate departments, and the infants' school accommodates 500 children. The site contains two acres, and the cost of the buildings was limited to £17,000.

Wigan Elementary School.

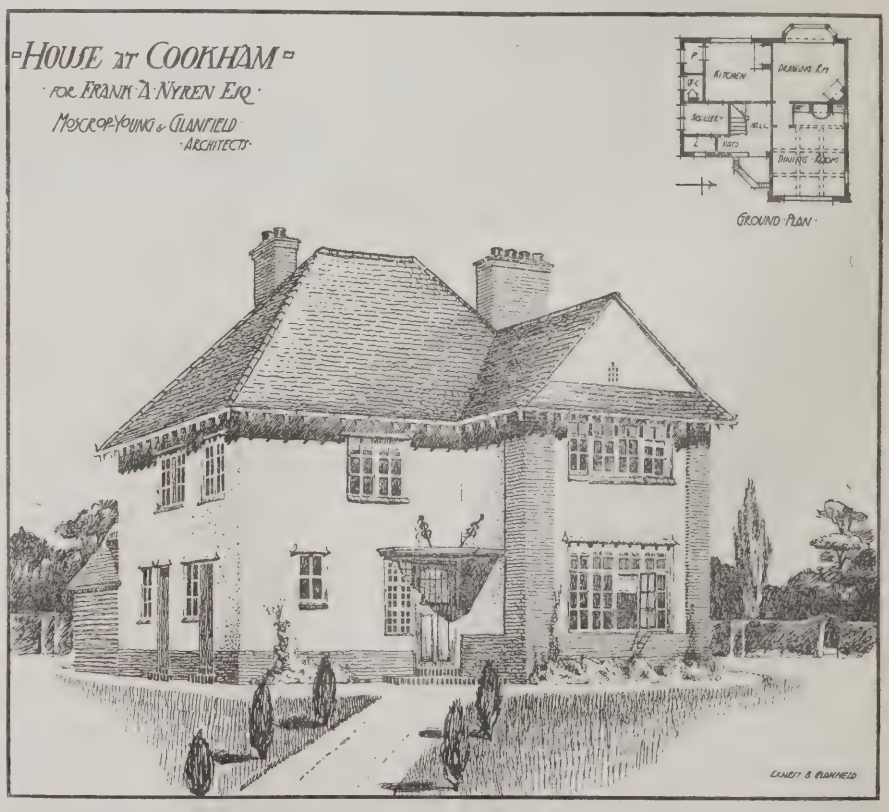
In the note under this heading in our issue of March 16th, the name of Mr. H. D. Holland was inadvertently given as Mr. J. B. Holland.

LIST OF COMPETITIONS OPEN.

MAR. 31. SHEFFIELD ENDCLIFFE PARK CHURCH. Particulars given in our issue of March 16th.

APRIL 23. COUNTY OFFICES, NAVAN. Particulars given in our issue of March 16th.

MAY 31. MUNICIPAL OFFICES, KARACHI. Particulars given in our issue of March 16th.



JUNE 15. ELEMENTARY SCHOOLS, ACTON. Particulars given in our issue of March 16th.

NO DATE. NEW ELEMENTARY SCHOOL and ENLARGEMENT OF ANOTHER, COVENTRY. Particulars in our issue of March 16th.

NO DATE. ELEMENTARY SCHOOL, BLOXWICH. Particulars given in our issue of March 16th.

OBITUARY.

The death is announced of one of the old standards of the building trade of Sunderland, Mr. Robert Stafford, who died at his residence, 20, Salem Street, at the end of February. Mr. Stafford, who was in his 73rd year, was at one time an inspector in connection with the highways of the town. Leaving this occupation to turn his attention to building, he founded a business in conjunction with his son Arthur, under the style of Robert Stafford and Son, and was responsible for the erection of a large number of important buildings in the district, including schools under the Durham County Council. Latterly, owing to Mr. Stafford's advanced age, he had taken no active personal part in the business.

This house is to be built of stock bricks for general walling, covered with white cement roughcast, and plinth of red and purple bricks, flush pointed. The roof is of dark red hand made sand faced tiles. All exterior wood work is painted green—interior white. On the first floor are three good bedrooms, bathroom, w.c., and linen closet, while provision is made in the roof for a bedroom to be added at a future date. The cost, which includes cesspool drainage, is £410. The builder is Mr. Bloomfield of Maidenhead and Hitchin, and the architects are Messrs. Moscrop-Young & Glanfield, of Brook St., Bond St., W.

CONCRETE AND STEEL SECTION

(MONTHLY.)

Mr. Butler and His Critics.

Mr. D. B. Butler's conclusions on the boiling test for cement came in for some rather spirited criticism at the recent meeting of the Concrete Institute. The fact that such widely opposite views should exist on such an important question as the testing of cement is evidence of the value of inaugurating such a society as the Concrete Institute, to band together men for the purpose of mutual investigation into, and discussion of, these and other problems. It is apparent that Le Chatelier test is generally, accepted by the majority of manufacturers and engineers as thoroughly satisfactory; but Mr. Butler condemns it for an indiscriminate condemnation of both sound and unsound cements. If Mr. Butler's contention is right in fact, his conclusion would appear to be an obvious one. The discussion at the Cement Institute is hardly conclusive. Mr. Cooper sounded a note of distrust, and Mr. Judd was not ready to give definite views about the matter. Further investigation by one of the Institute's Research Committees is obviously the reasonable course. The methods of conducting the same test may, in the hands of different people, differ greatly though not apparently. The contention of Mr. Cooper that cement, whether slow or quick setting, should not be boiled for an arbitrary period is only one indication of variation in treatment.

Concrete and Gun Fire.

The resistance of concrete to gun fire was tested practically to some extent at Port Arthur, and different opinions have been expressed regarding the lessons to be drawn from the results there. In a general way, the objections to concrete have been based mainly on the claim that the effect of the impact against it was to crack such a large mass of material that the integrity of the structure was much weakened even beyond the immediate vicinity of the point of impact. Reinforced concrete has been suggested a number of times as a substitute for mass concrete in military works, in order to meet this objection, and some tests were recently conducted at Sandy Hook for the purpose of determining to what extent the reinforcement would limit the effect of the projectile. The results are of a confidential character, but it is understood that the success of the reinforcing rods in confining the shattering of the concrete to the immediate neighbourhood of the pathway of the shot through the mass was marked. While the steel did not appear to reduce greatly the absolute depth of penetration of the projectile, it localised the damage very satisfactorily, so long as the shells did not detonate after penetrating.

Crushed Rock.

The widespread use of concrete for all kinds of purposes has created a demand for so many kinds of crushed stone that any builder or quarry owner who fails to endeavour to meet this demand is missing a great opportunity. The larger sizes of crushed stone are still in demand, but in addition there is a ready sale for "screenings" to dust of all degrees of fineness, and it is precisely this finer part, which was formerly considered useless, which is most profitable to-day. The chief requisite is an ample screening plant, so that any grade of material can be supplied, and the particles be of practically one size, or at any rate within very narrow limits. For this purpose it is becoming increasingly necessary to use two screens (or sets of screens), one to keep out the large pieces of material and the other to remove the particles which are too fine for the purpose required. A little effort will soon show how large is the opportunity for doing an increased business, for those who already have facilities for crushing stone, and whilst different localities must have their needs met in different ways, it will generally be found that the two simplest and best methods are (a) to supply the material carefully graded according to specified sizes of particles, or (b) to take a more portable form of crushing and screening plant to some locality where the crushed rock required for a particular job is found in the immediate vicinity of the place where it will be used. For obvious reasons the latter method is less profitable than the former, but, properly arranged, it can be made to yield a good return. Incidentally we may mention that a good way to be "on the trail for business" of this kind is to keep a close look-out for contracts or other work where concrete is likely to be needed, and to "get in" for the supply of aggregate or crushed rock, using the invincible argument that your rock is carefully graded so as to secure the best possible results and backing this argument up with actual demonstrative tests where they appear to be desirable.

How to Select Rolled Steel Joists.

The zig-zag line in the table of safe loads carried by rolled steel joists is a source of great annoyance to the man who, not having made a study of architectural engineering, occasionally has to select a section of joist to carry a floor or a wall. One man has a hazy sort of idea that the depth of his beam should be from one-twelfth to one-twentieth of the span, and even with a very light load he would not dare to go beyond the zig-zag line, but pays—or makes his client pay—for a heavier section. Another man ignores the mysterious warning line and loads his 12in. ×6in. ×54lbs. rolled steel joist with 10 tons over a span of 30ft., because reliable catalogues tabulate this as the safe load. Then he wonders why his plaster ceiling cracks.

The following notes show how to deal with light loads over long spans, and should make the calculation of deflection a simple matter.

The deflection formula for beams of uniform section throughout their length under a distributed load—

$$D=\frac{5Wl^3}{384EI}$$

applies to rolled steel joists, and can be reduced to a very simple equation by cancelling out terms which are constant.

The bending moment equals the moment of resistance, which in turn equals the section modulus (Z), multiplied by the permissible stress per square inch (f). We have therefore for a distributed load —

$$\frac{Wl}{8}=fZ$$

$$=f\frac{I}{y}$$

but in the case of a rolled steel joist, $y=\frac{d}{2}$,

$$\therefore \frac{Wl}{8}=\frac{2fI}{d}$$

and

$$W=\frac{16fI}{dl}$$

The coefficient of elasticity may be taken at 12,000 tons, and inserting this value in the deflection formula along with the value now found for W, we get,

$$D=\frac{5Wl^3}{384EI}$$

$$=\frac{5\times 16fI\times l^3}{384\times dl\times 12000I}$$

$$=\frac{fl^2}{576000d}$$

The limiting stress for architectural work is usually 7.5 tons per square inch; "f" may therefore be taken out of the formula, giving

$$D=\frac{7{\cdot}5l^2}{576000d}$$

$$=\frac{l^2}{7680d}$$

$$=\frac{144L^2}{7680d}$$

$$=\frac{3L^2}{160d}$$

This will be found to agree exactly with the formula from which the deflection co-efficients in Dorman, Long and Co.'s tables have been drawn up. Take, for example, one of the 12in. joists,

$$D=\frac{3L^2}{160d}=\frac{3L^2}{160\times 12}$$

$$=\cdot 001562L^2$$

and ·001562 is the co-efficient given in their list. The more complicated formulæ given in Redpath, Brown and Co.'s and other lists will also be found to agree with this.

Our formula now gives the actual deflection in inches, but it usually matters little to the designer whether his beam deflects ½in. or 1½ins., so long as it keeps within a certain ratio in terms of the length of the span. This ratio can be arrived at in one operation, without finding the actual deflection in inches, by further simplifying the formula.

$$\text{Let } \Delta=\frac{\text{deflection in inches}}{\text{span in inches}}$$

$$\text{then } \Delta=\frac{3L^2}{160d\times 12L}$$

$$\Delta=\frac{L}{640d}$$

Example: A rolled steel joist, 12ins. × 6ins. ×54lbs., loaded with a distributed load to the permissible stress (7.5 tons) over a span of 16ft., will show a deflection of

$$\Delta=\frac{L}{640d}=\frac{16}{640\times 12}$$

$$=\tfrac{1}{480}\text{th of the span.}$$

From this very simple formula we can find the maximum length of span for which any section can be used, fully loaded, so as not to exceed any given ratio of deflection. Assuming that $\frac{1}{480}$ is the maximum deflection that should be allowed to avoid the cracking of plaster, we find that

$$\frac{L}{640d}=\frac{1}{480}$$

$$\therefore L=\frac{640d}{480}$$

$$=\frac{4d}{3}=\frac{4\times 12D}{3}$$

$$=16D$$

This means that any section, fully loaded, over a span greater than 16 times the depth, will deflect more than $\frac{1}{480}$. If it be desired to use the same section for a longer span without increasing the ratio of deflection, a lower permissible flange stress (f) must be adopted. Therefore, reintroducing 7.5 tons into our formula,

$$f = \frac{640d \times 7{\cdot}5}{L \times 480}$$
$$= \frac{10d}{L} \text{ for long spans.}$$

Example: Spanning a 30ft. opening with a 12in. × 6in. × 45lb. rolled steel joist, what is the permissible stress to give deflection not exceeding $\frac{1}{480}$ under a distributed load?

$$f = \frac{10d}{L} = \frac{10 \times 12}{30}$$
$$= 4 \text{ tons per square inch.}$$

The load would then be about 5½ tons instead of 10 tons, as given in the tables.

If it be required to find what factor of safety should be employed,

$$\text{factor of safety} = \frac{\text{ultimate stress}}{\text{safe stress}} \left(= \frac{}{f}\right)$$
$$= 30 \div \frac{10d}{L}$$
$$= \frac{3L}{d}$$

or reducing the span to inches we get

$$\text{factor of safety} = \frac{1}{d} \times {\cdot}25$$

This differs slightly from the formula for long spans $\left(F = \frac{1}{d} \times {\cdot}287\right)$ given in Professor Adams's "Designing Ironwork," 2nd Series, Part IV.

For a deflection ratio of $\frac{1}{360}$, it can be found in the same way that the limit of span if fully loaded (distributed) is $21\frac{1}{6}$ times the depth, and

$$\text{permissible stress for long spans} = \frac{40d}{3L}$$
$$\text{and factor of safety for do.} = \frac{9L}{4d}$$
$$= \frac{1}{d} \times {\cdot}1875$$

It would make an interesting study to work out simplified formulæ on the same lines for various methods of loading, but for irregular loading it is usually near enough for ordinary purposes to calculate the deflection as if the load were distributed. It is handy to remember that a beam fully stressed will always deflect further under a distributed than under a central load (which gives less deflection than any other loading). The centrally loaded beam deflects ·8 of an inch for every inch in the case of a distributed load; therefore, a joist deflecting $\frac{1}{480}$ under a distributed load will only show $\frac{1}{480} \times \frac{8}{10} = \frac{1}{600}$ under a full permissible central load.

A REINFORCED CONCRETE CHURCH ROOF.

The illustrations show an interesting innovation in Ecclesiastical Architecture, the reinforced concrete roof to the R.C. Church of St. Aloysius, Glasgow, of which Mr. C. J. Menart, 241, West George Street, Glasgow, is the architect. The church, which is cruciform in shape, has walls faced with red freestone, and the reinforced concrete roof rises from the main walls. Over the nave, transepts, and apse, the roof is in semi-circular arches, and the roof of the nave has a clear span of 44½ft. and a length of 65ft. This roof is supported on arched ribs which are reinforced to take the whole of the thrust. The ribs carry a 4½in. slab forming the roof covering, which slab is reinforced with expanded steel. In this roof are two four-light cupolas, which also act as ventilators. The transept and apse roofs are of similar construction but of smaller span. Three brick main arches carry a large central dome, which is 44ft. by 34ft. 3in., and has a radius for the first part of 29ft. 6in., and for the upper portion or dome of 21ft. In this dome are eight large lights. The concrete in the dome is 9in. thick, and is reinforced with expanded steel and with circumferential round rings. The roof was carried out by the Expanded Metal Company.

THE BOILING TEST OF PORTLAND CEMENT.

By D. B. BUTLER, A.M.Inst.C.E., F.C.S.

This paper was delivered by Mr. Butler at the eighth ordinary general meeting of the Concrete Institute, held on the 17th inst., when Mr. Bertram Blount, F.I.C., presided. The chairman aunounced that the membership was now 866. Messrs. C. A. Reed of Clapham and Mr. W. S. Hobart Norton, B.A., B.E., A.M.Inst.C.E. of the P.W.D., India, were elected members.

The soundness of Portland cement, i.e., its freedom from expansion ("invariabilité de volume" or "volumenbeständigkeit," to give its French and German equivalents respectively), the author thought, was its most essential property, and should be always the first thing to be determined in estimating the constructive value of a sample. It was obvious that, notwithstanding other highly desirable qualities which a cement might possess, such as great strength or large sand-carrying capacity, if it was unsound, and contained certain elements which subsequently caused expansion, with, in extreme cases, disintegration and crumbling, it was not only of no use as a constructive material, but was at once converted into a destructive material. Although with the improved methods of manufacture obtaining of recent years these extreme cases of disintegration had become more and more rare, expansion of a more or less dangerous nature was not infrequently met with.

The original test for soundness, the author explained, was based more or less on working conditions, i.e., pats or cakes of neat cement, plunged into cold water when set, or after 24 hours in air, and examined at intervals; if at the end of a month they showed no signs of cracking or distortion, and adhered firmly to the glass plate on which they were made, the cement was considered satisfactory as regards soundness. This test laboured under the obvious disadvantage that 28 days had to elapse before a definite opinion could be pronounced, and the cement finally accepted for use, a delay that was frequently impossible in practice, although it might be argued that the generally specified 28 days' tensile tests laboured under the same disadvantage.

To obviate this long delay, several accelerated tests for soundness have been evolved from time to time. About thirty years ago the late Henry Faija introduced a test for soundness, consisting in subjecting cement pats to 7 hours in moist air of 110 deg. F., followed by 17 hours in warm water of 120 deg. F., which enabled an opinion to be formed in 24 hours instead of having to wait 28 days as formerly.

The next accelerated test was that of M. Deval, brought out about ten years later; after 24 hours in air or under a damp cloth at ordinary testing-room temperature, and 2 days in water of 176 deg. F., the strength developed was supposed to be comparable with that of 1 day air + 6 days in ordinary cold water; while after a further 4 days in hot water, i.e., 1 day in air and 6 days in hot water, the strength developed was supposed to be comparable with 1 day air+27 days' cold water.

The Boiling Test.

From the 176 deg. F. of the Deval test it was but a step to the boiling test now in vogue, and having regard to the difficulty of always maintaining an equable temperature of 176 deg. F., the boiling test is certainly considerably simpler; the ordinary qualitative boiling test consisted of allowing a pat to set 24 hours in a damp box of 60 deg. F., and then placing it in cold water, which was gradually raised to boiling and maintained at that temperature for 6 hours, after which treatment the pat should show no signs of warping or cracking; it was sometimes further specified that the edges of the pat should also break off with a sharp crisp ring, which was a very sure indication that it was free from cracks or flaws of any kind.

tive order, and depended more or less on the personal experience of the operator, as to whether the results obtained were seriously defective or not.

Bauschinger Apparatus.

The most accurate quantitative method of measuring expansion or contraction, whether in air, cold water, or by the various accelerated tests, was the Bauschinger micrometer calliper apparatus, in which the test pieces consisted of prisms or square bars 100 mm. long and 22 mm. by 22 mm. cross-section; the delicacy of the instrument was such that variations in the length of the bar to within $\frac{1}{200}$ mm., or 0.005 per cent., could be deter-

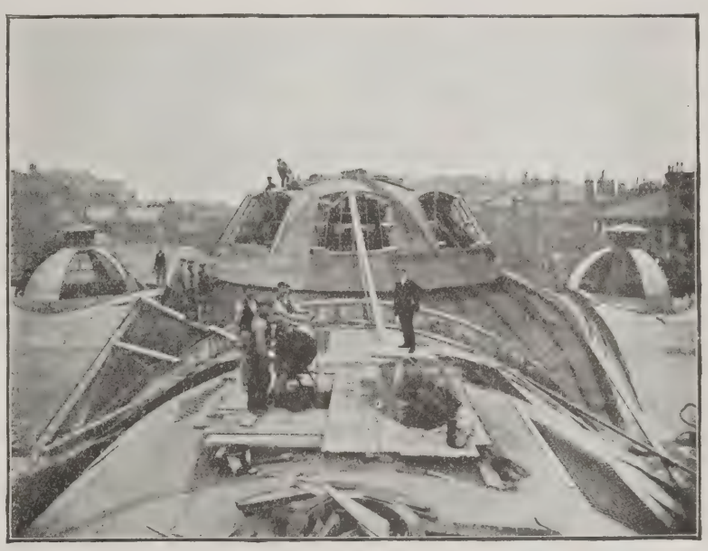
mined with certainty. It, however, required very careful expert handling, and was somewhat expensive, the equipment, including moulds, costing about £12.

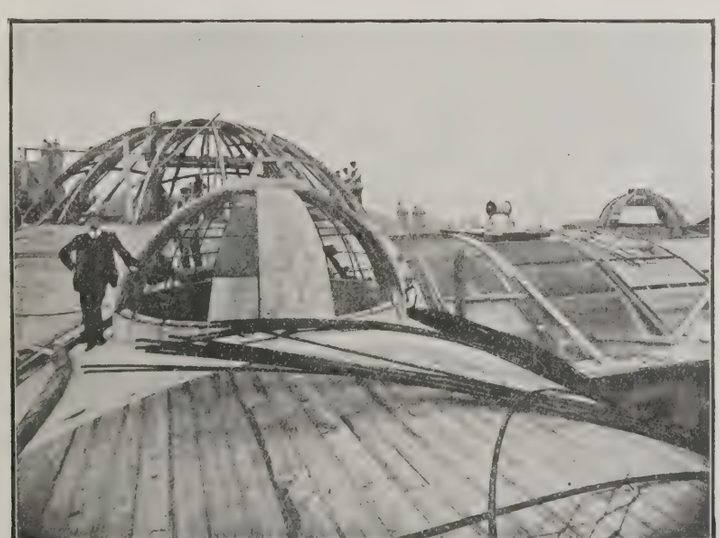
The Le Chatelier Test.

The only other quantitative method of note for determining expansion was that devised by M. Le Chatelier, which was adopted by the British Standards Committee in 1904 as the standard method of determining the soundness of cement. The description and method of working, taken from the revised British Standard Specification of 1907, was as follows:—



"The cement shall be tested by the Le Chatelier method, and shall in no case show a greater expansion than 10 millimetres after 24 hours' aeration and 5 millimetres after 7 days' aeration.

"The apparatus for conducting the Le Chatelier test consists of a small split cylinder of spring brass or other suitable metal of 0.5 millimetre (0.0197 inch) in thickness, forming a mould 30 millimetres (1 3-16 inches) internal diameter and 30 millimetres high. On either side of the split are attached two indicators with pointed ends, the distance from these ends to the centre of the cylinder being 165 millimetres (6½ inches).



"In conducting the test, the mould is to be placed upon a small piece of glass and filled with cement gauged in the usual way, care being taken to keep the edges of the mould gently together while this operation is being performed. The mould is then to be covered with another glass plate, a small weight is to be placed on this, and the mould is then to be immediately placed in water at a temperature of 58 to 64 degrees Fahrenheit, and left there for 24 hours.

"The distance separating the indicator points is then to be measured, and the mould placed in cold water, which is to be brought to boiling-point in 15 to 30 minutes, and kept boiling for six hours. After cooling, the distance between the points is again to be measured; the difference between the two measurements represents the expansion of the cement, which must not exceed the limits laid down in this specification."

It certainly had this advantage over the Bauschinger apparatus, that it was cheap and simple, and involved no costly apparatus, but whether it was equally accurate was quite open to discussion. In the course of ordinary professional testing work, the author stated he had had to carry out many thousands of tests for soundness by the Le Chatelier method, and the conflicting results

THE R.C. CHURCH OF ST. ALOYSIUS, GLASGOW: VIEW OF CENTRE DOME IN COURSE OF CONSTRUCTION. C. J. MENART, ARCHITECT.

THE R.C. CHURCH OF ST. ALOYSIUS, GLASGOW: REINFORCED CONCRETE ROOF IN COURSE OF CONSTRUCTION. C. J. MENART, ARCHITECT

he had sometimes obtained had led him to the conclusion that where the condemnation of a cement for unsoundness was concerned, the results given by the Le Chatelier test should not be too rigidly interpreted.

The author then quoted series of experiments to show the variable results which might be obtained by different operators, and even by the same operator working under exactly the same conditions.

In order to ascertain if differences in the elasticity of the moulds were in any way responsible for the variable results obtained, the author devised a special apparatus. The variation given by different moulds was considerable. However, the results did not definitely point to differences in the elasticity of the mould as being responsible for the variable results obtained, since No. 10, which was an extremely weak mould, gave the least expansion in two cases out of three.

It was thought possible that the position of the test pieces in the boiling bath, whether in the centre or round the outside, might have had something to do with the variations found, and tests were therefore made to ascertain if this were so, but the results suggested that this was not the case. Nor did variations in time of cooling after boiling appear to affect the result in any way.

Differences Due to Aeration.

Another curious feature about the Le Chatelier test was that instances were very frequently met with in which the expansion was considerably greater after 6 days' aeration of the sample than when first received, or after only 24 hours' aeration. From the point of view of a test for soundness this was an obvious absurdity, since it was a well-known and thoroughly acknowledged fact that cement improved with aeration as regards soundness; it therefore very strongly suggested that the increased expansion of such samples upon boiling was due to causes altogether outside the question of soundness as it was generally understood, i.e., the presence of disruptive agencies within the cement itself, which would eventually cause expansion under ordinary working conditions.

Less Expansion on Boiling than in Cold Water.

In a paper read before the Concrete Institute in May last on the setting properties, etc., of Portland cement, Mr. H. K. G. Bamber referred at considerable length to the Le Chatelier boiling test, and raised one or two very interesting points. He first of all drew attention to the fact that the expansion of the specimen during the preliminary 24 hours' immersion in cold water was altogether ignored, only the subsequent expansion during boiling being taken into account, and pointed out that instances frequently occurred in which the expansion in cold water was considerable, whereas that resulting on boiling was negligible. The author of the present paper said he could fully bear out that statement, for it was the custom in his testing-room to record in every case the expansion caused by previous immersion in cold water, as well as after boiling, and in many cases, more especially with slow-setting cement, the expansion in cold water was very much more serious than that due to boiling.

Surely it was more important to record the expansion under actual working conditions in cold water than that produced by boiling, for whatever the value of boiling as an accelerated test for soundness, cement was rarely, if ever, subjected to boiling water in practice.

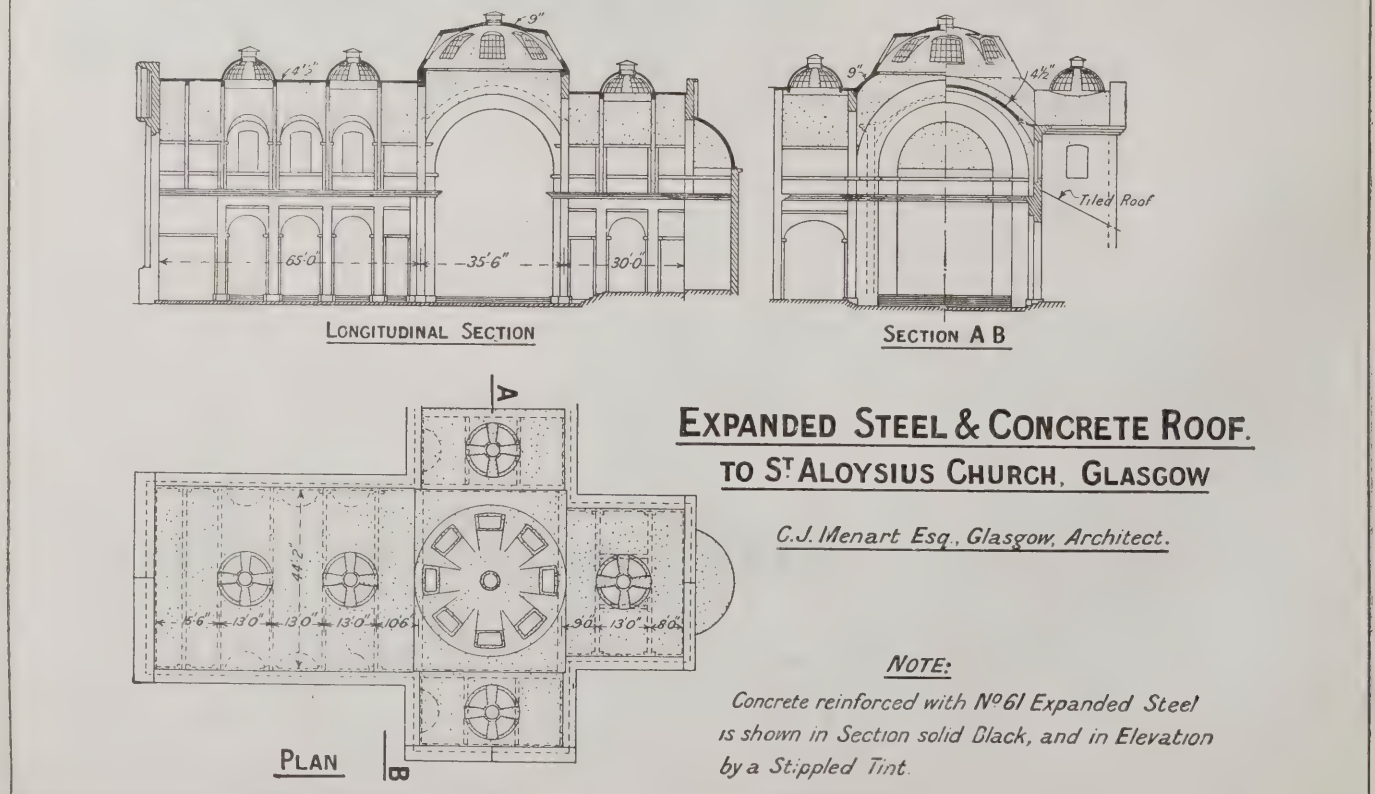
Slowly Hardening Cements.

Mr. Bamber also referred to the somewhat arbitrary condition of only allowing the cement 24 hours to harden under water, before being subjected to the boiling water, and suggested that failure was frequently due to the cement, more especially the slowly hardening varieties, not having had time to sufficiently harden in that brief period to withstand boiling water.

Expansion of Coarse Particles.

Referring once more to Mr. Bamber's paper, he gave as one reason of cement sometimes failing to pass the Le Chatelier test, the inability of the coarse particles, or unpulverised clinker, to withstand boiling water without expansion, and expressed the opinion that "it has yet to be proved" that because such unpulverised material caused expansion when submitted to boiling water, that it would also cause expansion under ordinary working conditions in cold water. With this the author quite agreed, and quoted experiments which showed that there was something in the contention.

Author's Conclusions.



The experiments embodied in the paper, taken as a whole, appeared, the author suggested, to justify his remark at the commencement, that where the condemnation of a cement for unsoundness was concerned, the results given by the Le Chatelier boiling test should not be too rigidly interpreted. Apart from the mass of anomalies and conflicting results continually met with, it was quite an open question whether a cement should be condemned as unsound because it would not withstand boiling water 24 hours after gauging, whether that 24 hours' preliminary hardening was in cold water or in air.

Whatever excellent reasons there might be for or against accelerated tests, the author could vouch from personal experience for the fact that considerably less than twenty years ago not 10 per cent. of the Portland cement manufactured in England or elsewhere would withstand boiling water under the foregoing conditions; the obvious inference, therefore, was that if such was a true test for soundness, 90 per cent. of the cement used twenty years ago was unsound. This, in view of the hundreds of thousands of tons used for important engineering work throughout the world, was rather a startling proposition; and, having regard to the excellent condition of such work at the present time, was one that could scarcely be seriously maintained.

Discussion.

The Chairman. Mr. Bertram Blount having thanked the lecturer on behalf of the Institute for his lucid paper, said he would like—not as chairman but as a private member, to comment very briefly on the author's conclusions. It appeared to him that Mr. Butler thought because certain countries, such as Germany and America, had failed to prepare cement of the admirable quality obtainable here, that we should retrogress, and put the clock back twenty years. He thoroughly disagreed with him.

Mr. H. K. G. Bamber said Mr. Butler had dealt with his subject from the comparative point of view in so far as he described the various tests. The Faija test had been put first and foremost, whether because of its importance or because of its antiquity he did not know. At any rate, the Faija test was little used by manufacturers, because they knew that if any cement failed to pass this test it was thoroughly bad. Mr. Butler then took the Deval test, which the speaker had always looked upon as one of the most important and most satisfactory which a manufacturer could employ. His own experience had led him to believe that if any cement for which he was responsible passed this test there was no ground either for anxiety or for the sleepless nights of which the lecturer had spoken. Mr. Butler, in dealing with boiling tests, and with those of Erdmanger and Heinzel, omitted all reference to the boiled balls test, though he had described the roasted balls test. Why this was so he was unable to conjecture; but presumed the lecturer had not come into contact with it. It was a test, no doubt, that involved considerable inconvenience. He was glad to hear Mr. Butler describe the Le Chatelier test as cheap and simple, but he did not think the results of it should be too rigidly interpreted. Where the manufacturer, the expert, and the engineer had an opportunity of discussing the matter together, the engineer was always ready to waive any distinct line, whether as to accept-

ance or rejection. The cement which expanded in cold water was certainly more dangerous than the cement which only expanded when boiled. If the Le Chatelier test was one to be complied with, it was more a question for the cement manufacturer. The engineer, whatever his views as to the severity of the test, must come to the conclusion that it was better for him to have a cement which had passed a more severe test. He thought the Le Chatelier test had been of more value to this country than any test that had been brought before them. Like the chairman, he would be sorry to see the clock put back twenty years.

Mr. Davidson, being called upon by the Chairman, said that the Le Chatelier was in general use in France.

Mr. W. J. Cooper said, as far as the effects of the test was concerned, from investigations he had made, he was quite prepared to grant that in the vast majority of cases cement which complied with it satisfactorily was sound. There were cases in which, though there was practically little or no expansion, it had failed. If the cement failed to comply with the test he could not say that it was evidence that the cement was unsound. Cement, whether quick-setting or slow-setting, should not be boiled for an arbitrary period.

The Engineer, Aberdeen Harbour Board, Mr. Gordon Nichol said that if there was to the engineer one essential feature in cement, it was that of soundness. Aberdeen had, perhaps, a rather unenviable reputation for failures in cement, but he thought it was due probably to other causes than unsoundness in the cement. To the engineer testing for soundness was a *sine qua non,* and he must have some assurance that the material would not fail after proper treatment. He had great faith in the boiling test; but after Mr. Butler's paper, he felt his anchors dragging a little. For 16 years he had carried out the boiling tests very rigidly. He had used the Chatelier test for some time, but only for British standard specification. He was sure Mr. Butler did not mean to suggest the abandonment of the boiling test without any good reason. They must have cement which would satisfy the user as to its soundness.

Mr. F. J. Tristram spoke on the question of the elasticity of moulds. He had a mould which was extremely useful; but his experiments had been more in trying to find out the action of boiling water on cement which subsequently caused expansion.

Mr. J. W. Plaister, as a manufacturer, said he had always thought that the Le Chatelier test was most satisfactory. The vagaries of the test, to which Mr. Butler had referred, were, he thought, capable of explanation. The manufacturers were perfectly contented with the Le Chatelier test, as conducted by experts, but undoubtedly it was somewhat dangerous in the hands of amateurs. He had seen some extraordinary results where boiling had been conducted in all sorts of extraordinary ways.

Mr. Laurence Ladd, called upon to give his views as a chemist, said he was not prepared to do so. He could only say that he had been using the Le Chatelier boiling test since January, 1904. His experience was that the expansion in cold water was due to the presence of gypsum or sulphate of lime.

The Lecturer. Mr. Butler thanked the meeting for the cordial reception of his paper. Replying to criticisms, he said he wanted a test for soundness which would detect unsoundness. The test which condemned both the sound and the unsound, indiscriminately, was of no value. In spite of the unkind things which had been said by Mr. Bamber concerning the Faija test, he still believed it was the very best for finding soundness in a material which did not show it.

DESIGN OF T-BEAMS.

BY JOHN C. GAMMON, B.Sc. (LOND.) A.C.G.I.

Concluded from page 175, No 787.

Double Reinforcement.

When double reinforcement has to be used, the second series of curves must be used in conjunction with those already described. In finding "W_T" the same method of procedure as that before described is followed, with the exception that the choice of "h" is not restricted by the value which can be given to B. It will be noticed that the curves for the steel are straight lines, and consequently for a value of M exceeding the limits of the curve, W_T can be found by taking twice the amount required for half the given bending moment. Thus the value of W_T for a given value of "h" and "t" for M=6,000,000 in. lbs. is twice that required for M=3,000,000 in. lbs.. and so on.

Thus the value of W_T is obtained. Next the maximum bending moment which can be taken by the concrete is found by obtaining the value of M corresponding to the given values of "B and h." This value is deducted from the actual bending moment. The result of this subtraction sum gives the bending moment which has to be taken by the steel to be placed in compression, "W_C." The value of W_C is readily found by using the curves given; these curves being drawn for given values of "A." In general practice, "A" will be somewhere between 1½ inches and 2½ inches. Curves are drawn for A=1½inches, A=2 inches, and A=2½ inches.

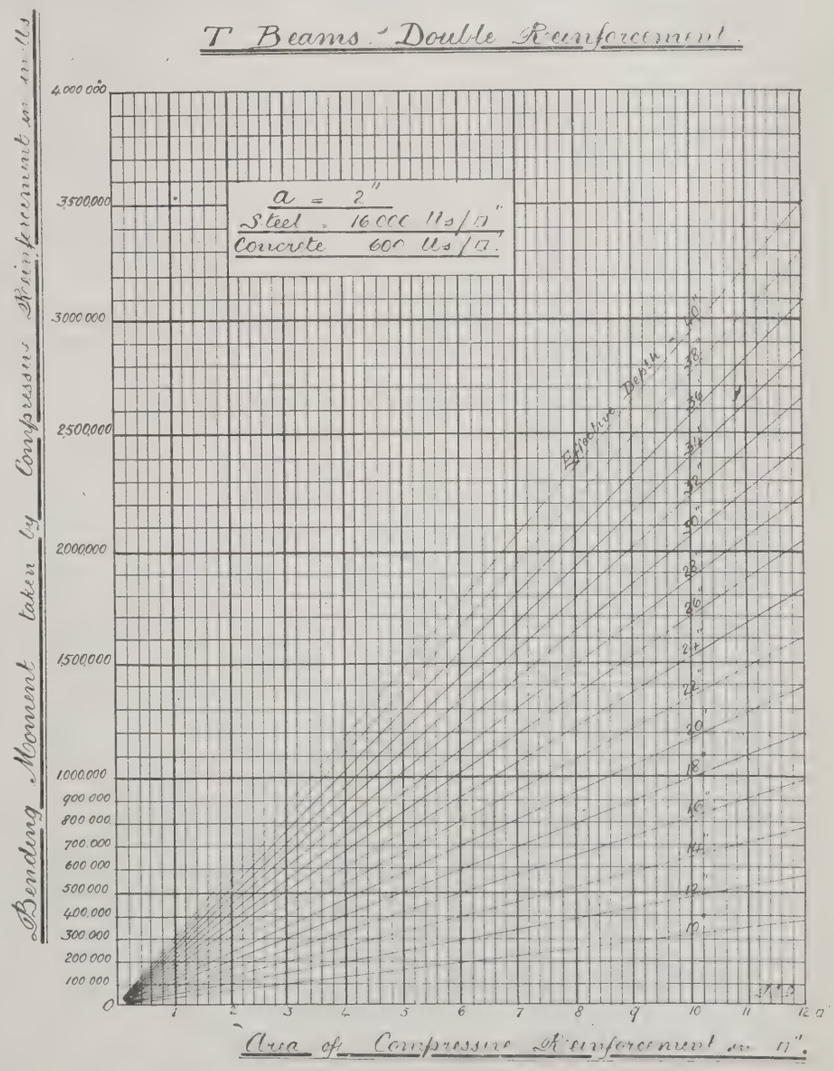
Having fixed values of M, B, h and t: the design of a T beam with double reinforcement is thus resolved into a subtraction sum, the areas of steel required in tension and compression being at once obtained by using the curves.

The following is an example worked out:—

Example:—

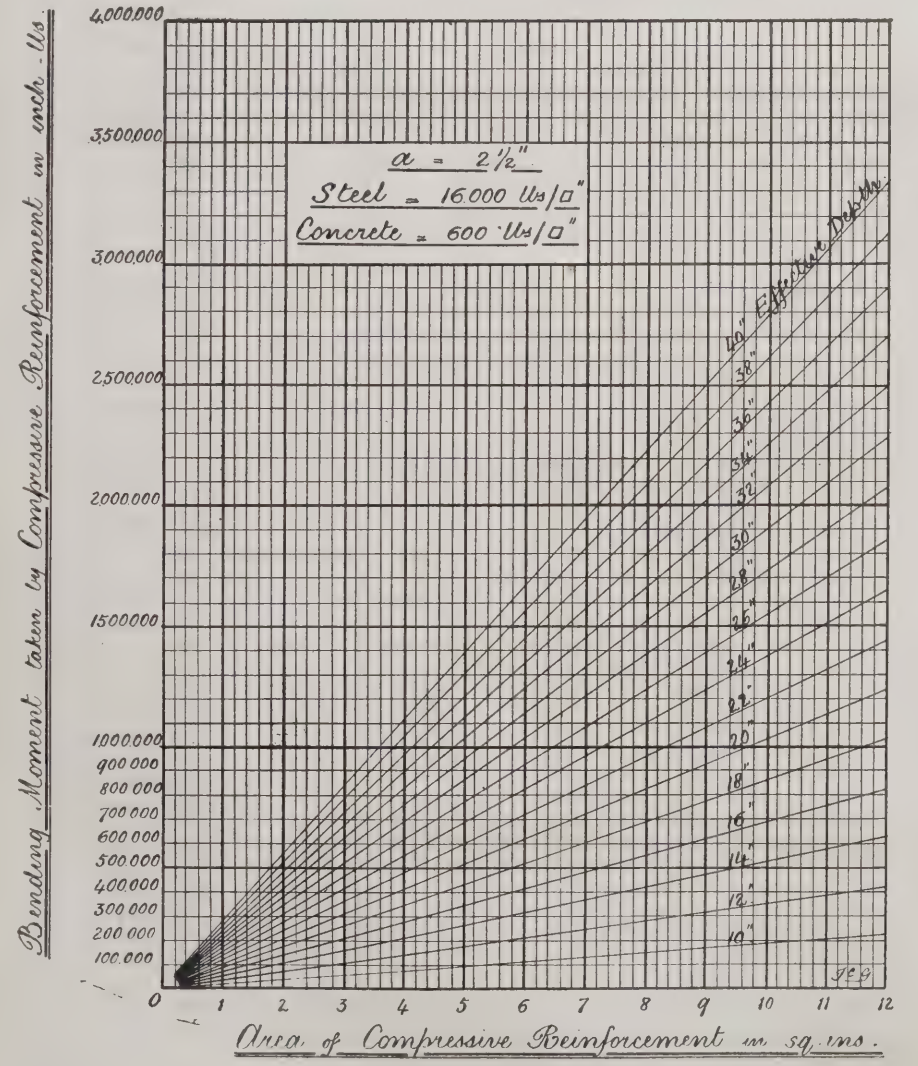
M=5,000,000 in. lbs.
B=50 inches.
t=5 inches.

In the first place it will be necessary to fix the depth of the beam. It will be most economical, generally, to have the greatest possible depth of beam in order to reduce the amount of steel in compression, which is always uneconomically stressed. It will be assumed that 34 inches is the greatest possible effective depth.



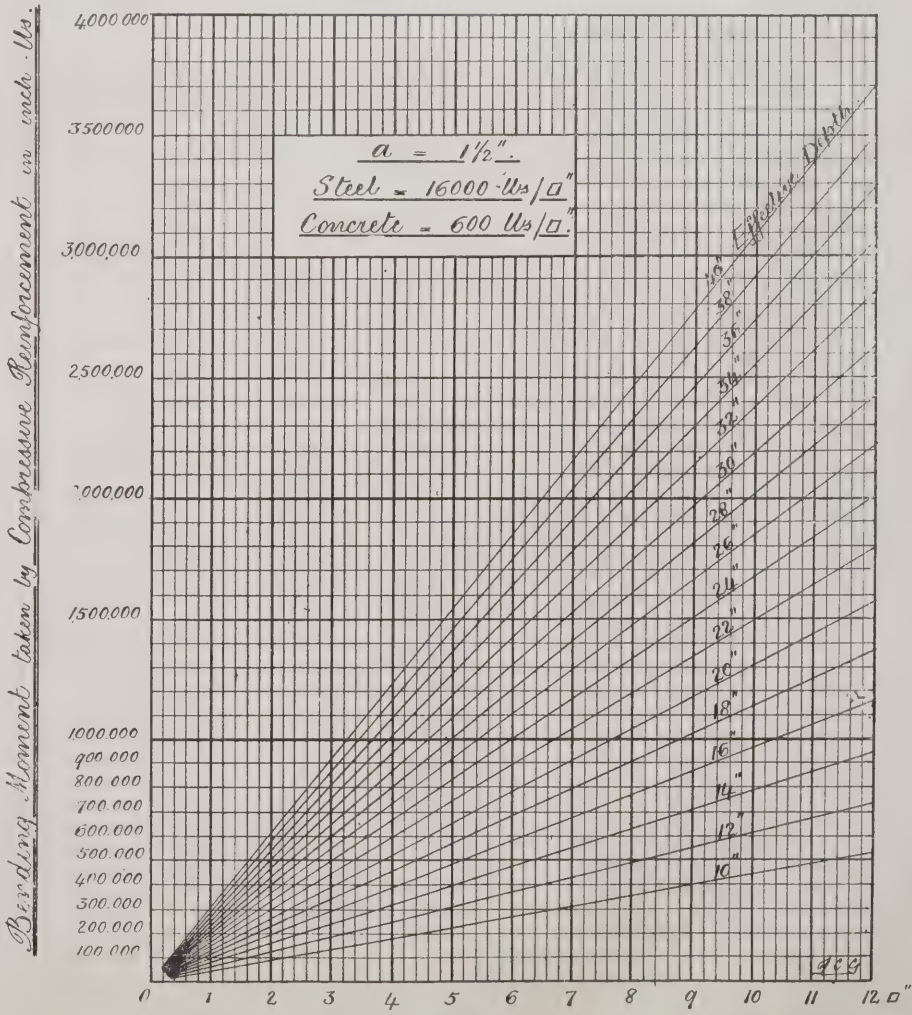
From the curves drawn for t=5 inches, it is seen that W_T =9·95 sq. inches for a value of M=5,000,000 in. lbs., and of h=34 inches.

From the same curve it will be seen that the bending moment taken by a 50-inch breadth of slab with an effective depth of 34 inches is 3,780,000 in. lbs.



This leaves a bending moment of (5,000,000 −3,780,000) in lbs. to be taken by W_C. Placing this steel at a distance of 2 inches from the top of the slab; from the curves corresponding to a value of A=2 inches, it is found that the steel required in compression for a bending moment of 1,220,000 in. lbs. is 5.08 sq. inches.

Thus W_C and W_T are found.



The following formulæ are usually recommended for checking the design of T beams with double reinforcements, and the above example is submitted to this check in order to prove the accuracy of the methods recommended above:—

T Beams. Double Reinforcement

T Beams Double Reinforcement

DIAGRAMS FOR ARTICLE ON THE DESIGN OF T. BEAMS. BY JOHN C. GAMMON.

$$(1.)\quad u = \frac{B.t^2}{2} + 15\left(W_T \times h + W_c \times a\right) \Big/ B \times t + 15\left(W_T + W_c\right)$$

substituting the values assumed and found above.

$$u = \frac{50 \times 25}{2} + 25\left(9{\cdot}95 \times 34 + 5{\cdot}08 \times 2\right) \Big/ 50 \times 5 + 15\left(9{\cdot}95 + 5{\cdot}08\right)$$

$$= 12{\cdot}3 \text{ inches.}$$

$$(2.)\quad y = u - \frac{t}{2} + \frac{t^2}{6\left(2u - t\right)}$$

$$= 12{\cdot}3 - 2{\cdot}5 + \frac{25}{6\left(2 \times 12{\cdot}3 - 5\right)}$$

$$= 10{\cdot}0 \text{ inches.}$$

$$(3.)\quad M = \frac{c}{u}\left[\frac{B \times y \times t \times (2u - t)}{2} + 15\left(W_c \times (u-a)^2 - W_t \times (n-u)^2\right)\right]$$

$$= \frac{600}{12{\cdot}3}\left[\frac{10 \times 50 \times 5 \times 19{\cdot}6}{2} + 15\left\{5{\cdot}08 \times (10{\cdot}3)^2 + 9{\cdot}95 \times (21{\cdot}7)^2\right\}\right]$$

$$= 5{,}000{,}000 \text{ in lbs. (very nearly).}$$

In using the first series of curves for finding the value of W_T when Double Reinforcement is required, the possible difference in length of its leverage arm, due to the disposition of the steel in compression, is neglected. Any error, however, caused by this, is quite inappreciable, as the test of the above exact formulæ will show.

A DEFENCE OF REINFORCED CONCRETE.

In a long letter to "The Times" to correct some misapprehensions on the subject of reinforced concrete, Mr. G. C. Workman, of Messrs. Edmond Coignet, Ltd., says that though it may not be ten years ago since its use was advocated here, owing, amongst other things, to the inelastic and unprogressive nature of our Building Acts, we must not forget that other countries were using this material for expensive works many years before it was introduced into England. As to statements to the effect that steel and concrete are very different materials as regards expansion and contraction, and that the bars, being tightly embedded in the concrete, might cause the latter to crack for variations of temperature between 32 deg. F. and 120 deg. F., he states:—"As a matter of fact, the properties of expansion and contraction of steel and concrete for normal temperatures are practically the same. It is only when the heat increases very considerably and is allowed to reach the steel that there may be danger of cracks. We must remember, however, that in a structure in reinforced concrete the bars are of a very small diameter and very well protected against variations of temperature by the mass of the concrete, which is a very bad conducdtor of heat and cold. In this respect reinforced concrete offers a very great advantage over steel construction, because in a conflagration the small steel bars cannot possibly have the destructive effect which steel girders and stanchions possess to a high degree, even when cased with some more or less fire-resisting material. Another argument which is constantly put forth is the question of the rusting of the steel bars in the concrete. It is a well-known fact that concrete acts as a preservative from rust, and it has been proved that, when steel bars covered with rust are embedded in concrete, the process of oxidization is chemically stopped.

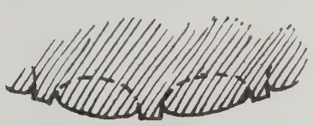
ENQUIRIES ANSWERED.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional, or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The Editor, will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned, but the enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies, or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consul their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s., made payable to Technical Journals, Ltd. and crossed, and stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.



This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable, and it must be understood that both question and reply will, as a rule, be published in these columns.

Fluting Ionic Columns.

"YOUNG ARCHITECT" (CALCUTTA) writes: "Can you inform me if I am correct in putting flutes on the lower half (only) of an Ionic column? I have seen many examples showing the upper portion fluted, but cannot find one with the flutes on the lower portion."

—Your proposal cannot be regarded as a good one. Flutes have a logical purpose—to express the supporting function of columns—to make them live, as it were, by emphasising an appearance of vertical thrust. Incidentally, they serve to rob the surface of the column of a baldness which it might

CABLING

have in contrast with other parts of a richly decorated structure, and to accentuate the play of light on its curved contour. There is no sense in starting or stopping such expression halfway. The custom of fluting the upper part of columns only arose out of the system of cabling—a method by which the lower third of flutes was filled by a torus, probably originally with the idea of preventing the delicate arrises from being damaged where they are within reach.

G.

Swelling of a Tiled Floor.

"PERPLEXED" (NORTHAMPTON) writes: "The body of a church is paved with 4-in. square tiles laid on a floated bed of cement and sand in equal parts ¾in. in thickness, with a 6-in. bed of lias lime concrete underneath. The ground below the concrete is clay. The floor has been laid about twenty years.

"A few days ago the congregation were disturbed by loud cracking reports lasting about two minutes, and upon these ceasing it was discovered that near the centre of the church, a portion of the floor about a yard square had risen in a convex form, the rise at the centre being about two inches.

"Upon examination it was found that the tiles had risen, the cement bed and concrete remaining as originally laid, except that there was seen an old crack on one side.

"There are no vaults under the church, nor any heating flues sufficiently near to suggest a cause.

"Upon examining the rest of the floor the tiles were found only to have risen slightly in several places, as they sounded quite hollow when tapped.

"With the exception of an old settlement in one of the walls there does not appear to have been any recent movement in them."

—It is well known that unless the cement contracts at the same rate as the tiles settle in a paved floor the latter will be damaged, and it frequently happens that unsuitable mixtures of cement and sand, which are too rich in cement, will cause the tiles to rise and overlap one another, or to form a somewhat dome-shaped piece in the floor. In the last mentioned case, if the room becomes heated too rapidly for the air to escape, the pressure set up by this expansion has been known in several instances to cause explosions.

Very accurate measurements of the contraction of cement set in air and of that set under water show that in the former case the contraction increases very rapidly some time after use, and is nearly double the contraction of cement set under water.

The contraction is much greater with cement than with a mixture of cement and sand, and it is seldom that a mixture containing more than one-quarter of its volume of cement can be used satisfactorily.

If the tiles are well soaked in water before being used the cement will expand in setting so long as the tiles remain saturated with moisture, but will contract and "buckle" as the tiles dry. If the sub-floor has a rigid surface to which the cement bed can adhere the contraction-strains set up may be a long time before they show themselves, and in some cases no appreciable damage is done.

The only curious part about the tiles in the church in question is that they have taken so many years to reach such a state of strain, though similar effects are known in several instances of tiles laid for 10 or 12 years, which were put down in a dry state instead of being thoroughly soaked before use. The absence of heating-flues in the neighbourhood of the most prominently defective part of the floor is inconclusive evidence, as two cases (if not more) are known in which the mixture was drawn by capillary attraction through a length of 90ft. The real cause of defect in this case, however, as far as can be judged from the evidence supplied, is the use of a cement-mixture too rich in cement in the first instance and, probably, to the tiles not having been sufficiently soaked to enable them to "grow" to the cement.

A.B.S.

Storage of Rainwater.

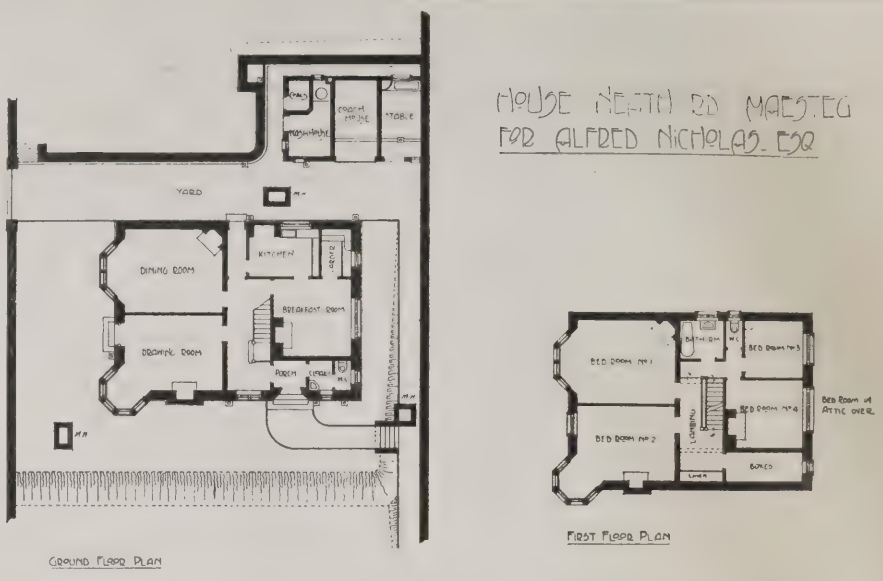
X. Y. Z. (NORTHANTS) writes: "Owing to a difficulty in being able to procure water for drinking purposes in a country district, I find it necessary to make provision for utilising the rain water for this purpose, and I shall be glad if you can give me any information as to the best method of storing and filtering or otherwise purifying a supply of water for a fairly large establishment. I shall be glad to know also of one or two first-class text-books on this subject, but particularly desire to hear of something that has been successfully carried out in actual practice."

—We doubt your finding a special text-book on this subject, though pamphlets and articles in various periodicals and magazines are certainly to be had (see the "World's Work" of three or four years ago for an article in one month's issue). In text-books on water supply written 15 or 20 years ago you will find allusions to methods and installations, as the method was then in vogue.

The difficulties in the way of this method of obtaining water are the need of separating the earlier part of a rain shower, all of which is fouled by dust and soot on the roof, leaves in the gutters, etc., from the clean water of the succeeding part; and the need of cleaning the eaves gutters periodically, especially in spring and autumn, when bud covers and leaves accumulate quickly. In other seasons the cleaning need not be done as often; every

week when leaves fall, and every month or six weeks in other seasons, according to local circumstances, should meet the needs. If your client will do this, he will obtain a clear water supply; the same man, or a regular man attending to the separator also.

An absolutely automatic separator has yet to be made, but one that will separate the first fall and store the rest or half the rest can be had, but after every rain it needs to be set to tip the foul water to the sewer, which it thus flushes.



Filtration can be satisfactorily done by a gravel and sand bed, or even small gravel only. Two filters, for alternate use and cleansing, are, of course, needed. But filtration alone will not remove the taste of accumulated soot, bird-droppings, and dead leaves in eaves gutters, so these must be cleaned out at regular intervals.

In reckoning the rainfall, it is not the area of the roof on the slope, but the area of the site on the level that has to be measured. A 36-in. rainfall means one cubic yard per square yard.

1 inch of rain per square yard = 0·75 oubic feet.
= 4·69 gallons.
= 0·028 cubic yards.
= 48 pounds.

9 cubic yards of water will supply 6 people with 16 gallons each a day for a fortnight.

Drinking and cooking water only is amply allowed for at 4 gallons to 3 people a day; baths and washing also will need up to twelve times this amount.

GROUND FLOOR PLAN FIRST FLOOR PLAN

E. WHITFIELD BURNETT, M.S.A., ARCHITECT.

The roof tiles should be non-absorbent. If they be not, a vegetable growth soon comes on the shady parts. The spores of fir trees will stick to slates, and turn them greeny black, and if such trees be near they may have to be felled.

INGENIOR.

HOUSE AT MAESTEG. E. WHITFIELD BURNETT, M.S.A., ARCHITECT.

This house has been erected on an elevated site overlooking the whole of the town and outlying districts of Maesteg. The facings up to string-course are of orange-red Cattybrook bricks, and above the string-course the walls are rough-casted in cement. The whole of the dressings are of Bath stone. The roofs are covered with hand-made and sand-faced Wrotham medium red tiles. The woodwork is of red deal throughout, and painted white. The plans show the general arrangements.

Practical Notes.

"A REGULAR SUBSCRIBER" (LEEDS) writes: "Please state in what issues of the 'Builders' Journal, 'Practical Notes for Architectural Draughtsmen,' by A. W. S. Cross, and Alan E. Munby, were published."

—The series extended over the following issues: Sept. 19th, 22nd, Oct. 23rd, 24th, Nov. 7th, 21st, Dec. 12th, 1906, Jan. 16th, Feb. 6th, 20th, and March 27th, 1907, and have since been republished in a complete form at 12s. net., post free.

Composition for External Application.

DETAILS (DUBLIN) writes: "Additions have been made to a country house which is covered with old lime stucco, in good condition, but slightly discoloured. It is lined out to imitate ashlar. The additions are cement plastered (3 to 1), finished with hand float. It is desired to treat old and new work with some composition (not oil paint) to get a uniform appearance (Portland stone colour). What is the most suitable mixture for this work? Should it be applied with a brush or with a spraying machine? Should the new work receive any extra treatment or is it possible to coat the old work only, to match the new?"

—We suggest the use of "Coatostone," which can be supplied by the Coatostone Decoration Co., 77, Mortimer Street, Regent Street, London, W. The firm will be able to furnish instructions with regard to application.

Obstruction in a Drain.

T. W. R. (MAIDA VALE) writes: "Two terrace houses with lessees A and B have a combined system of drainage entering the public sewer from B's land.

(1) Can B make A pay half the cost of searching for and removing an obstruction in the interceptor when A's drains were first proved to be clear?

(2) The obstruction caused a nuisance in both houses. On any such future occasion could B lawfully ask A to agree to pay half the cost before remedying the defect? (In the present instance B did not consult A before ordering the work.)

(3) On what grounds can the sanitary authority enter premises and test drains?

(4) Can the sanitary authority order A to disconnect his drains from B's; (1) if A's drains are efficient and (2) if inefficient?"

—As to (1), it is important to consider whether the pipe, at the point where there is an interceptor, is a "drain" or a "sewer." The significance of this lies in the fact that if it is a "sewer" it is repairable, and must be kept in order by the local authority (Public Health Act, 1875, ss. 4, 13). Upon the facts as stated, the "sewer" appears to

begin behind the interceptor: for a pipe may be a drain for a certain distance and then commence to be sewer from the point where it is joined by the drain from another curtilage (*Beckenham Urban District Council v Wood*, 60 J.P., 490). There have been many other cases to the like effect. In these circumstances it would seem that B has gone to the expense of doing work which he might have called upon the local authority to do. He cannot therefore seek to charge A with any part of it. As to (2), this is answered by the reply to (1). B could have called upon the local authority to remedy the defect in the sewer, and it is difficult to see how A could have been brought into the matter. The liability of the local authority is clear. But if the "interceptor" lies in the course of a "single private drain" within the meaning of that term as used in the Public Health Act, 1890, s. 19, the proper course for B would have been to give notice to the local authority pursuant to s. 41 of the Public Health Act, 1875, to the effect that there is a nuisance. On receiving that notice the local authority (if the Act of 1890 has been adopted for the district) may do the work necessary to abate the nuisance, and recover the cost from the two occupiers in proper proportions. As to (3), the local authority have power to enter premises and test drains on the written complaint of any person that a drain is a nuisance or injurious to health, or where, on the report in writing of their surveyor or inspector of nuisances, the local authority have reason to suspect that any such drain is a nuisance or injurious to health (Public Health Act, 1875, s. 41, as amended by Public Health Act, 1907, s. 34). As to (4), there is nothing in the Acts (so far as is known) which gives the local authority any such power.

The Housing of Bicycles.

"SEPIA" (HERTS) writes: "Kindly advise me as to the most compact and economical method of arranging for the housing of, say, 100 bicycles, for a large day school."

—The average bicycle is 6ft. long, 18in across handlebars, and 16in. across pedals. The handlebars are 2ft 6in. back and 8in. deep. In arranging storage for a school it is necessary to provide for impatient and careless withdrawals, and perhaps the best arrangement is an open shed, closed on both sides by roller shutters, and with racks so

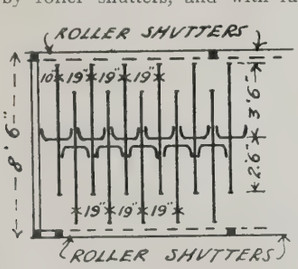


FIG. 1.

placed (as in Fig. 1) that bicycles are inserted from both sides, front wheel foremost. By this means the cranks do not clash, and any cycle can be withdrawn independently of others. Where access on both sides is impossible, an arrangement as in Fig. 2 may be adopted, but is not so good, as bicycles in the second row would be difficult to withdraw without removing those in front. By either method a length of about 80ft. would be necessary to store 100 cycles. Folding doors may be fitted instead of roller shutters, but the latter are preferable as they are out of the way when open. G.

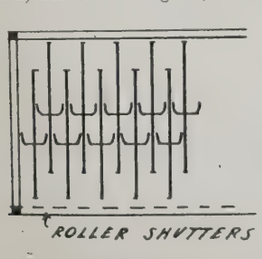

FIG. 2.

Cleaning Rough Plate Glass.

W. B. (NORWOOD) writes: "A certain public building has a large quantity of glazed roofing. This glass is mostly rough plate and has been in position about 20 years. It has, however, become very black on the outside, and keeps out a great deal of light. Most of the ordinary methods of cleaning have been tried (spirit of salts, soda water, etc.), but they have had no effect. Can any reader acquaint me with any reliable method of cleaning the glass?

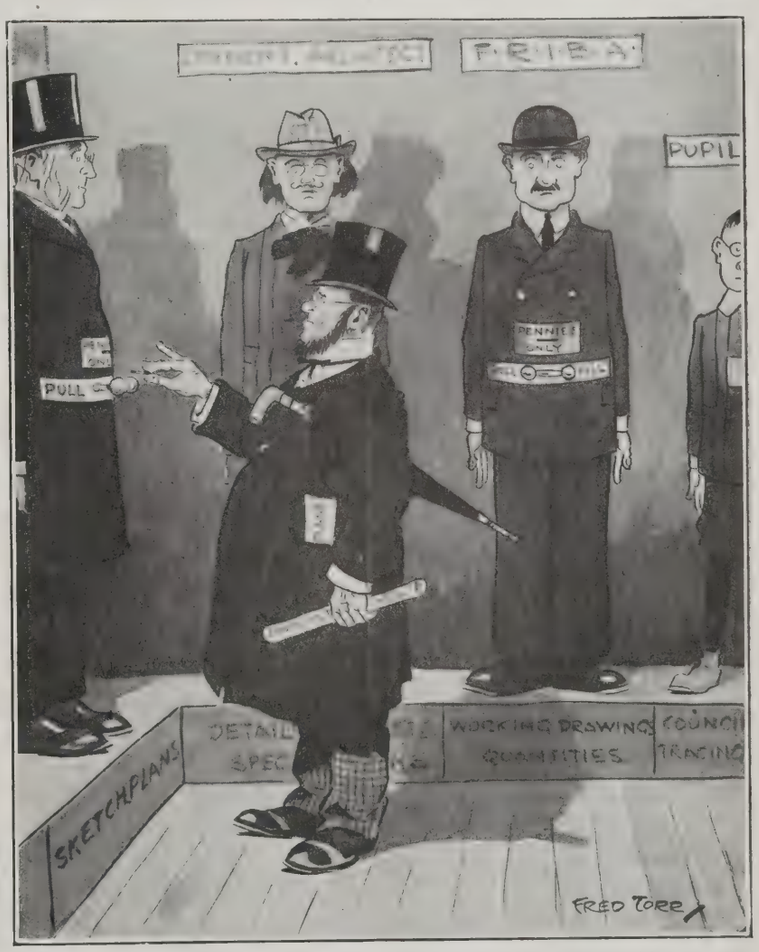
Defects in Limestone Work.

J. B. (DUBLIN) writes: "I shall be much obliged if any of your readers who carry on work in limestone districts can give me any information as to difficulty having arisen in limestone set in fine cement mortar. The position where I have carried out works which have developed defects in joints of limestone work is very exposed—practically on the Atlantic—and no care in the renewal of pointing, etc., seems to make it staunch. In a gale the moisture sweats through at the joints and weeps down inside. The work is mostly composed of dressings to windows in 2ft. masonry wall, metal casements. There is also an octagon bay window, one storey, with crenallated top, all dressed limestone 12in. thick."

[Perhaps readers with experience of this kind will correspond.—Ed. "B.J."]

Glazed Partitions not Sound Proof.

"SOUNDLESS" (NOTTINGHAM) writes: Some months ago I put up some partitions in a warehouse, and my client has recently called me in to say that anyone in one sale room can hear anybody in the adjoining rooms. The partitions are all glazed above the height of 4ft., as it is essential to get the light as little obstructed as possible. Can you suggest any method of preventing conversation in one room being overheard by anyone in the next?



—In all probability the difficulty arises chiefly from the place being too quiet; if there were more general noise individual conversations would not so readily obtrude themselves. Glazed partitions are extremely common in large offices, and so convenient that any slight objection should be overlooked. Double glazing, with as much air space between as possible, would no doubt reduce the passage of sound in the simplest way, but some would still pass from the vibration of the wood panels. HENRY ADAMS.

Heating Small Country Houses by Warm Air.

G. L. (INVERNESS) writes: "Will you let me know the name of any firm or firms who do the heating of small country houses with warm air?"

—G. N. Haden and Sons, 4, Albert Square, Manchester; John Grundy, 393a, City Road, London, E.C. Messrs. Haden also have a London address. It is the case of cleaning the heating surface, and the actual cleaning of it once or twice a season that ensures the continued success of this method. When comparing prices, the arrangements for cleaning the chamber and air pipes under floors or up walls should be considered, and the relative sizes, surfaces, and weights.

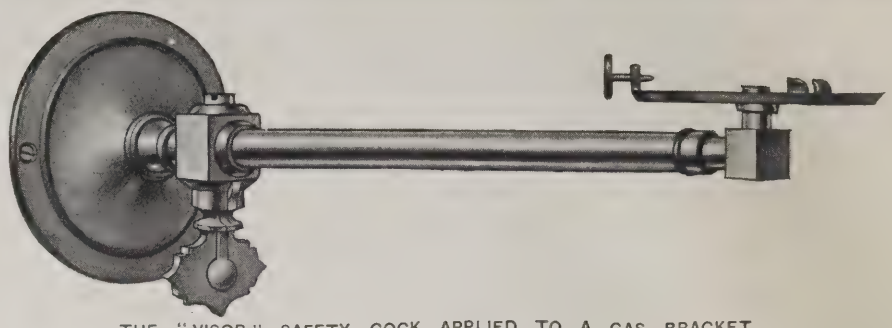
PENNY-IN-THE-SLOT ARCHITECTURE.

A vision of the future, when the present advertised offers to supply sketch plans and designs free on receipt of a penny stamp, become general. The Chairman of our District Council procures designs for the New Town Hall.

TRADE AND CRAFT.



A Vanished Abbey and a Varnish Factory.

The Cistercian Abbey of Stratford Langthorne, commonly known as West Ham Abbey, is briefly recalled in a quaintly devised pamphlet that has been issued by Messrs. Robert Ingham, Clark and Co., Ltd., whose varnish works are "built on the site thereof." Several fragments of the Abbey-arches, walls, etc., were in existence fifty years ago, but now almost all that remains is an arch or window opening which is built into an outer wall of Messrs. Clark's premises. Several interesting illustrations of details of the old Abbey, as well as a small view and a plan of the entire building, are given; but the main purpose of the pamphlet is to describe and illustrate the firm's extensive varnish works, which were first erected on this site about forty years ago. Since that time, many additions have been made, and the area now occupied is about six acres, so that the firm claim that theirs is the largest manufactory in England devoted exclusively to varnish. They are contractors to the Governments of many countries. The various buildings—the counting-house and general offices, the leviathan tanks for the storage of turpentine and of oils and varnishes, the oil refinery, the three vast oil varnish factories, the thinning house, the maturing stores, the black japan factory, the spirit varnish factory, the turpentine varnish factory, the dispatch stores, the contract inspection warehouse, the testing rooms, the museum, the Pearline and Britannia Composition factories, the workshops and forges—are described and illustrated in this booklet, which is got up in the fashion of an ancient document, of which the parchment cover is stained and discoloured in imitation of the ravages of time. The pamphlet therefore is quaintly artistic, as well as decidedly interesting and useful.

Sash-fasteners, Door-bolts and Safety Cocks

A sash-fastener and door-bolt combining the maximum of strength, with absolute security against outside tampering, and which are, moreover, of very neat design, and moderate in price, are a very welcome addition to the department of door and window fittings. The "Visor" sash-fastener is so constructed that the action of fastening pulls the sashes together and holds them tightly at two points, thus reducing to the utmost limit the window-rattling nuisance. The two arms of the fastener then automatically lock themselves together in such a manner that it is impossible to open them from the outside; yet from the inside the lock is instantly released by the simple action of pushing back the fastener. The patent "Visor" door-bolt also locks and unlocks automatically on the simple action of pushing or drawing the bolt, the head being fitted with a perpendicular lever which springs into a hole provided in the base-plate when the bolt is shot, so that it cannot possibly be released or opened from the outside. The mere natural pressure put on the thumb-piece, however, when drawing the bolt is all that is required to unlock it from the inside.

The lever locking device, as applied to the "Visor" cock, consists of a pair of levers pivoted within a recess in the plug upon a single pin or bearing. A small helical spring, placed between the thumb-pieces at the top extremity of the levers, and within the thickness of the handle, serves to force the upper extremities of the levers apart and its lower parts together, with the result that when the thumb-pieces are pressed against the action of the spring, the lower extremities are raised up and out of the two notches or grooves provided in the crown of the body of the cock (into which they engage themselves automatically when turned off), thus releasing the plug from the lock and allowing it to be turned in the ordinary way. As the recess or slot in the plug does not extend below the crown of the cock, the gas-tightness of the cock is in no way jeopardised.

THE "VISOR" SAFETY COCK APPLIED TO A GAS BRACKET.

In each case, the locking device is actuated by the simple action of seizing in the ordinary way the knob of the bolt or sash, or the handle of the cock, the normal pressure of thumb and forefinger being sufficient to move the levers of the locking mechanism. It is pointed out that the numerous accidental deaths from asphyxiation, are nearly all caused by the inadvertent turning-on of gas-cocks, especially in bedrooms, where, on retiring to rest, a person may easily, without knowing it, turn on the gas after putting out the light, the ordinary cock affording no very certain indication of whether it is on or off, and being, in the dark, easily turned on by an accidental and unconscious touch from the hand or finger. Again, the unprotected floor-cock commonly fitted to gas fires is particularly liable to accidents. The "Visor" cock, however, can only be turned on by deliberate intention. An accidental kick or knock cannot turn it on, as both levers have to be pressed before this can occur. This safety principle, of course, admits of almost limitless applications, and is adapted for spirit vails, urns, wine and beer vessels, and for various uses on motor cars. The manufacturers are the Autolock Safety Cock and Bolt Co., Ltd., 317, High Holborn, W.C.

Messrs. Colledge and Bridgen, Midland Lock Works, Wolverhampton, announce that they have opened a London office at 34, Queen Anne's Chambers, Westminster, S.W. Their London manager, Mr. Wilson Aldwinckle (late of the firm of Messrs. Thos. W. Aldwinckle and Son), is in charge of the London office.

* * *

It is announced that the business of Messrs. C. Chancellor and Co., Ltd., manufacturers of paints, enamels, varnishes, stains, etc., including "Velure," "Stripso," and other specialities, has been converted into a private limited company, and that it will be continued as C. Chancellor and Co., Limited, but under the same management and proprietorship as before. We believe that Mr. H. G. Chancellor, M.P., who won a seat at Haggerston at the recent election, is a member of the firm.

COMING EVENTS.

Wednesday, March 30.

CARPENTERS' HALL LECTURES. — Mr. F. W. Pomeroy, A.R.A., on "Sculpture as applied to Buildings," 7.30 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION. —Mr. J. B. Stoughton Holborn on "The Spirit of Mediæval Art," 8 p.m.

Friday, April 1.

ROYAL SANITARY INSTITUTE. — Mr. W. C. Tyndale, on "House Drainage," 7 p.m.

LEICESTER AND LEICESTERSHIRE SOCIETY OF ARCHITECTS.—Students evening, 8 p.m. Mr. B. J. Fletcher, on "A Sketching Tour in Normandy." Mr. S. J. Wearing, on "A Sketching tour in Brittany." Mr. D. W. Day. on "Osmaston Hall, Derby."

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS (Southampton Row).—Mr. G. H. Palmer, on "The Influence of Illuminated MSS., on the Type and Decoration of Early Printed Books." 6 p.m.

Monday, April 4.

ROYAL SANITARY INSTITUTE. — Mr. J. E. Worth, on "Sewerage." 7 p.m.

R.I.B.A.—Mr. George Hubbard on "Architecture on the Eastern side of the Adriatic." 8 p.m.

Monday, April 4.

SOCIETY OF ENGINEERS (Room 18, Caxton Hall, Westminster).—Mr. Percy G. Scott, on "Moulmein Waterworks." 7.30 p.m.

Tuesday, April 5.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION.—Annual dinner, King's Hall, Holborn Restaurant, 6 p.m.

INSTITUTION OF CIVIL ENGINEERS.—Mr. D. A. Matheson on "The New Clyde Bridge of the Caledonian Railway at Glasgow"; Mr. F. C. Buscarlet on "The Queen Alexandra Bridge over the River Wear, Sunderland." 8 p.m.

Wednesday, April 6.

CARPENTERS' HALL LECTURES. — Mr. Thackeray Turner, F.S.A., on "The Craft of Repairing Buildings," 7.30 p.m.

ROYAL SANITARY INSTITUTE.—Dr. A. J. Martin on "Sanitary Aspects of Floods and Measures to be taken to prevent epidemics arising therefrom." 5 p.m. Mr. C. Chambers Smith on "Sewage Disposal." 7 p.m.

INSTITUTE OF SANITARY ENGINEERS.—Mr. A. B. Ogden on "The Cleansing of filtering media and materials for constructional work." 8 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION. —Associates' Business Meeting.

Friday, April 8.

ROYAL SANITARY INSTITUTE.—Professor H. R. Kenwood on "Water—Composition, Pollution and Purification." 7 p.m.

INSTITUTION OF CIVIL ENGINEERS.—Students' meeting. Messrs. G. H. Hodson and H. M. Gell on the reconstruction and extension of Egremont Ferry Pier. 8 p.m.

ROYAL SANITARY INSTITUTE.—Provincial Sessional meeting at Plymouth (Western Law Courts, the Guildhall). Mr. J. Paton on "The Removal of Town Filth." Dr. O. Hall on "The relative value of disinfectants in the control of Disease." 7.30 p.m.

Saturday, April 9.

EDINBURGH ARCHITECTURAL ASSOCIATION. —Visit to the New Markets and Slaughter-houses, Gorgie.

R.I.B.A.—Publication of names of applicants for candidature. Election on June 6th.

ROYAL SANITARY INSTITUTE.—Provincial sessional meeting at Plymouth. Visits.

Monday, April 11.

ROYAL SANITARY INSTITUTE. — Mr. Percy Griffiths on "Water Supply; Sources of Supply and Distribution." 7 p.m.

ROYAL SOCIETY OF ARTS (Cantor Lectures).—Mr. A. B. Searle's first lecture on "Modern Methods of Brickmaking." 8 p.m.

SURVEYORS' INSTITUTION.—Mr. T. A. Dickson on "The Report of the Royal Commission on the Poor Laws." 8 p.m.

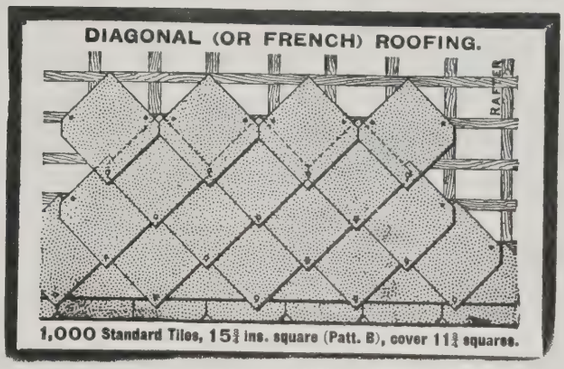
Tuesday, April 12.

R.I.B.A.—Finance Committee meets.

Wednesday, April 13.

ROYAL SANITARY INSTITUTE. — Mr. H. Percy Boulnois on "Scavenging; Disposal of House Refuse." 7 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION. —Annual Business Meeting. President's Valedictory Address. 8 p.m.



THE BEST OF ALL ROOFS

are made with

POILITE

ASBESTOS ROOFING SLATES

Absolutely Water and Fire-proof. Excellent Non-Conductors. Cool in Summer, Warm in Winter. Cheaper than Ordinary Slates—More easily laid. Much lighter in weight and more artistic in appearance.

POILITE SHEETS

For Interior Fire and Sound-Proof Lining.

BELL'S ASBESTOS CO. LTD.

Southwark Street, London, S.E.

Fulwell Hydrated Lime.

A high-class Lime, slaked by a patent process, and packed in bags. Saves the labour of washing and running the lime, will not blow, leaves no waste, may be stored without deterioration and without bursting the bags.

For mouldings and lathwork can be gauged with a much smaller proportion of plaster than ordinary lime.

Converts lime into a safe, reliable and convenient material with the advantages of a bagged plaster.

Further Particulars and Samples from:—

The Exors. of the Late

Sir HEDWORTH WILIAMSON, Bart.,

Fulwell Lime Works, SUNDERLAND.

"WYVURST"

PATENT MANHOLE CHANNELS.

THE LEEDS FIRECLAY. Co. LTD.

WORTLEY LEEDS & LONDON, 2 & 3 NORFOLK ST STRAND.

Tenders.

Addressed postcards, on which lists of tenders may be stated, will be sent free on application to the Manager, BUILDERS' JOURNAL, *Caxton House, Westminster.*

Information from accredited sources should be sent to "The Editor," at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Belfast.—For internal plumbing work in connection with the Purdysburn Villa Colony Asylum, No. 3 contract, for the Asylum Committee.

Wm. Coates and Son, Ltd., Fountain Street	£7,739
A. Higginbotham and Sons, Idle, near Bradford	4,450
J. Lowden and Co., Ann Street	4,397
R. Patterson and Co., High Street	4,111
H. McCloy, Talbot Street	4,087
J. Dowling and Sons,* Queen Street	3,900

Rest of Belfast.

*Accepted.

East Kirkby.—For two pairs of houses, Welbeck Street, East Kirkby, for the Kirkby-in-Ashfield Co-op Society, Ltd. Walter H. Woods, M.R.S.I., architect, Central Chambers, High Street, Long Eaton, near Nottingham. Quantities by the architect.

Tate and Son, Annesley Woodhouse	£919 10 0
Coleman, East Kirkby	900 0 0
A. W. Hoole, Kirkby-in-Ashfield	869 0 0
W. Bains,* East Kirkby	850 0 0

*Accepted price after deductions.

East Kirkby.—For three houses, Diamond Avenue, East Kirkby, for the Kirkby-in-Ashfield Co-op. Society, Ltd. Walter H. Woods, M.R.S.I., architect, Central Chambers, High Street, Long Eaton, near Nottingham. Quantities by the architect.

Tate and Son, Annesley, Woodhouse	£759 10 0
Coleman, East Kirkby	755 0 0
Bains, East Kirkby	741 0 0
A. W. Hoole,* East Kirkby	680 0 0

*Accepted price after deductions.

Long Eaton.—For a house and shop, New Street, Long Eaton, for Mrs. E. A. Burton. Walter H. Woods, M.R.S.I., architect, Central Chambers, High Street, Long Eaton, near Nottingham. Quantities by the architect.

R. J. Warren, Long Eaton	£567
J. Bull, Long Eaton	554
T. W. Youngman, Long Eaton	554
Brown and Son, Long Eaton	538

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about five days or longer after the date of this issue. Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders. The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the Contract, which requires them to pay the rates of wages current in the district.

BUILDING.

March 29—April 12. **FOREST HALL (Northumberland).**—Erection of a new Council school, to accommodate 370 scholars, at Forest Hall, for the Northumberland Education Committee. Contractors desirous of tendering should forward particulars of name and address to C. Williams, secretary to the Education Committee, The Moothall, Newcastle-on-Tyne, not later than March 29, with a deposit of £2 2s. for specification and bills of quantities. Plans for the work may be inspected at the office of Hope and Tasker ,Architects, Trinity Buildings, New Bridge Street, Newcastle-on-Tyne, and tenders must be forwarded to the Secretary.

April 2-13. **HERNE BAY.**—Construction of a pier pavilion on their new Pier extension at Herne Bay, for the U.D.C. Plans and specifications of the work can be seen and forms of tender obtained by appointment, at the office of the architects, Percy J. Waldram, F.S.I., and Moscrop-Young and Glanfield, 12, Buckingham Street, Charing Cross, W.C. Application for bills of quantities and general conditions should be made to Joseph Jub, clerk, Town Hall, Herne Bay, not later than April 2, accompanied by £1 1s. as a deposit. In the event of a tender being withdrawn, the deposit will be forfeited. Tenders are to be delivered to the Clerk.

April 4. **ABERCARN (Mon.).**—Erection of stores for the Abercarn U.D.C. Plans and specifications may be seen at the Council Offices, Abercarn, at any time by appointment. Tenders to be sent to J. Williams, Engineer and Surveyor.

April 4. **SMALLEY (Derby).**—Erection of proposed new infant school for 90 children, for the Governors of Richardson's School Foundation. Plans and complete specifications may be inspected on application to H. H. Dix, Clerk to the Governors, Smalley, Derby, to whom tenders must be sent.

April 4. **HALIFAX.**—Various works required in connection with additions to "Ashfield," Burnley Road. Plans and specifications may be seen and bills of quantities obtained at the office of Clement Williams and Sons, Architects, Post Office Buildings, Commercial Street, Halifax, from March 30. Tenders must be sent to the architects.

April 4. **CAMBERWELL.**—Construction of a new quay wall, at their Depot, Peckham Park Road, Old Kent Road, S.E., for the Borough Council, in accordance with the plans and specification prepared by the Borough Engineer. Specification and forms of tender can be obtained from the Borough Engineer's Office, Town Hall, Camberwell, S.E.

April 4. **NEWPORT (I.O.W.).**—Execution of a new drill Hall at Newport, Isle of Wight, for the County Territorial Force Association. Plans and specifications can be seen at the office of the architect, Percy M. Du Feu, Ventnor, from whom copies of same and form of tender can be obtained on deposit of £1 1s. Tenders to be sent to the office of the association, 32, Queen's Terrace, Southampton.

April 4. **HAMILTON.**—Alterations at Hamilton Post Office, for the Commissioners of H.M. Works and Public Buildings. Tenders are required for the whole work, and not for separate trades. Drawings, specification, conditions and form of contract may be seen on application at the Post Office, Hamilton. Bills of quantities and forms of tender may be obtained at H.M. Office of Works, 3, Parliament Square, Edinburgh, on deposit of £1 1s. Tenders must be delivered to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

April 5. **WALTHAM.**—Alterations and repairs required to be carried out at Waltham Council school, for the Committee. Specifications and plans can be seen at the house of the correspondent, C. J. Wanley Croft, Bridge, Canterbury. Tenders must be forwarded to the above-named correspondent.

April 5. **CLAYTON (Bradford).**—Masons', joiners', slaters', plasterers', plumbers', and ironmongers' trades required in the alterations and additions to Paddock Dyeworks, Pasture Lane. Plans, etc., may be seen and quantities obtained at the office of Sam Spencer, Architect, Old Bank Chambers, Great Horton, Bradford, from Wednesday, March 30, to Tuesday, April 5.

April 5. **SOUTH REDDISH (near Stockport).**—Erection of new branch premises at South Reddish, for the Stockport Industrial and Equitable Co-operative Society, Ltd. Copies of quantities may be had from Sagar Taylor, general secretary, on deposit of £1 1s. Tenders must be addressed to the Chairman. The drawings may be seen upon application to the Architect's Dept., Co-operative Wholesale Society, Ltd., Balloon Street, Manchester. Rate of wages, etc., clause to be observed.

April 5. **BIRMINGHAM.**—Alterations to Birmingham head post office, for H.M. Commissioners of Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to H.M. Office of Works, Birmingham. Bills of quantities and forms of tender may be obtained at H.M. Office of Works, Storey's Gate, London, S.W., on payment of £1 1s. Tenders must be delivered, addressed to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

April 5. **MARGATE.**—(a) The construction of steps leading from Hodges Flagstaff to Palm Bay, Margate, and (b) the construction of a brick wall on the face of the cliff behind the iron staircase leading from the Oval to the sands, for the Corporation, in accordance with the plans and specification prepared by the Borough Surveyor. Plans and specification can be seen and all further particulars obtained on application to Ernest A. Borg, Borough Surveyor, 13, Grosvenor Place, Margate. Tenders to be sent to Edward Brooke, Town Clerk, Town Clerk's Office, Margate.

April 5. **MOUNTAIN ASH.**—Erection of an infants' school, with offices, etc., at Clarence Street, for the Education Committee. Plans and specifications may be seen, and forms of tender and bills of quantities obtained, on application to the Architect, W. H. Williams, Town Hall, Mountain Ash, upon the deposit of £2 2s. The committee undertake to open only the bills of quantities sent in by the contractor whose tender will be accepted, and to return all the other bills of quantities unopened. Tenders and bills of quantities to be sent to A. Morgan, Director of Education, Town Hall, Mountain Ash.

April 6. **BOVEY TRACEY.**—New elementary school for 200 children, and a cookery and manual training centre, etc., for the Devon County Education Authority. Bills of quantities will be available on payment of £1 1s. Contractors desiring to tender must apply to the County Architect (Education), 1, Richmond Road, Exeter, not later than Friday, March 11, 1910, enclosing a crossed cheque drawn in favour of the County Treasurer. Quantities will be issued about March 22, and tenders must be delivered at the architect's office.

April 6. **EDENBRIDGE.**—Erection of a new Council school to accommodate 200 children, for the Kent Education Committee. Plans and specification, and form of contract, may be inspected at the offices of the Committee, until the time appointed for the delivery of the tenders. Any person desiring to tender and to receive a copy of bills of quantities must send in his name to Fras. W. Crook, Secretary, Caxton House, Westminster, S.W., accompanied by a deposit of £1, not later than noon on March 10, 1910. Tenders must be delivered to the School Correspondent, Chas. Sheal, High Street, Edenbridge, Kent.

April 7. **SWANSEA.**—Extension of the Victoria warehouse for a distance of 67ft. with four floors, and erecting two additional floors on the old building, for the Harbour Trust. Plans, specification and quantities can be seen and forms of tender obtained on application to A. O. Schenk, M.InstC.E., at the Harbour Offices, Swansea. Tenders should be delivered to Talfourd Strick, Clerk, Harbour Offices, Swansea.

April 7. **LONDON (Walworth).**—Reconstruction of part of drainage and alterations to and addition of new w.c.'s on the women's side of Newington workhouse, Westmoreland Road, Walworth, S.E., for the Southwark Guardians. A copy of the specification, plan, and form of tender may be obtained from A. W. Tribe, Architect, 120, Clapham Road, S.W., on the deposit of £2 2s. Tenders to be sent to Sydney Wood, Clerk, Union Offices, Ufford Street, Blackfriars Road, S.E.

April 8. **COVENTRY.**—Erection of proposed new building, Hill Top, Coventry, for the Triumph Cycle Co., Ltd., in accordance with plan and specification prepared by Herbert W. Chattaway, Architect, Trinity Churchyard, Coventry, at whose office plans and specification may be seen, and all particulars obtained, and to whom tenders must be sent.

April 8. **WREXHAM.**—For carrying out certain works at the Victoria School conveniences, for the Education Committee. Plan and specification may be seen, and form of tender obtained at the Borough Engineer's Office, Willow Road. Tenders to be delivered to Lawson Taylor, Clerk, Guildhall, Wrexham.

April 8. **BARNSLEY.**—Persons desirous of submitting tenders for the whole or various works required in the erection of forty-one houses, situated in Cranbrook Street, and Holgate Avenue, Barnsley, must submit their names to W. T. Turner, Architect, etc, Market Hill, Barnsley (not later than March 30), where plans may be seen on application, and quantities will be sent after the above date.

April 9. **TINSLEY.**—Erection of a boarded fence dividing the cricket ground from the recreation ground, for the Parish Council. Specification and quantities can be obtained on receipt of stamped addressed foolscap envelope, from J. L. Winkley, Clerk to the Council, 15, Harrowden Road, Tinsley, Sheffield, to whom tenders must be sent.

April 11. **SHOTLEY BRIDGE (Gateshead).**—Erecting new hospital for consumptive patients on the Whinney House Estate. Persons desirous of tendering are requested to send their names to George Craighill, Union Clerk, Poor Law Union Offices, Gateshead, to whom tenders must be sent. Quantities and further information will be forwarded in due course. Plans, etc., may be seen at the offices of the architects, Newcombe and Newcombe, 89, Pilgrim Street, Newcastle-on-Tyne. Names must be sent in by March 25.

April 11. **LINCOLN.**—Construction of a brick and stone tower, 108ft. high to T.W.L., to support a spherical bottomed steel tank, containing over 300,000 gallons of water, and subsidiary works at Westgate, Lincoln, for the Corporation. Drawings may be seen now, and specification, bill of quantities and form of tender obtained at the office of the Engineer, Mr. Neil McK. Barron, Waterworks Engineer, Lincoln upon production of a receipt from the City Accountant for the sum of £5 5s. Tenders, addressed to the Chairman of the Waterworks Committee, to be delivered at the office of W. T. Page, Deputy Town Clerk, Bank Street, Lincoln.

April 11. **YORKSHIRE (East Riding).**—(a) The erection of a teacher's house and alterations to school at South Duffield; (b) for alterations and additions to the Council school at Pocklington; (c) for alterations and additions to the Council school at Withernwick, for the Education Committee of the C.C. Plans and specifications may be seen and forms of tender obtained on application to the building surveyor, County Hall, Beverley. For the convenience of persons desirous of tendering, a copy of the plans and specifications, together with forms of tender, will be deposited at the respective schools. Tenders to be delivered to John Bickersteth, Clerk to the East Riding Education Authority, County Hall, Beverley.

April 11. **WEST HEATH (Northfield).**—Erection of cubicles for isolation purposes at the hospital, situate at West Heath, Northfield, for the U.D.C. in accordance with plans and specifications prepared by Ambrose M. Cross, A.M.I.C.E., of 23, Valentine Road, King's Heath, the Engineer and Surveyor to the Council. Two sets of tenders are required as follows:—(1) Construction of steel glazed sashes; (2) general builder's work. Bills of quantities and forms of tender may be obtained, and plans and specifications may be seen at the office of Ambrose W. Cross as above, on payment of a deposit of £1 1s. Tenders, No. 1 or 2, as the case may be, must be sent to Edwin Docker, Clerk to the Council, 10, Newhall Street, Birmingham.

April 12. **TIERNASLIGO (Ireland).**—Erection and furnishing of National school buildings at Tiernasligo, County Donegal. Plans and specification can be seen at Londonderry (Victoria) Royal Irish Constabulary Barracks. Tenders must be sent to the Office of Works, Dublin.

April 12. **BACUP.**—Covering in of the River Irwell with masonry and brick arch, for a length of about 300 lineal yards, situate within the borough of Bacup, for the Corporation and the Lancashire C.C. Plans may be seen and copies of the specification and bill of quantities obtained at the County Bridgemaster's Offices, 8, East Cliff, Preston, to whom tenders must be delivered, addressed to the Chairman of the Main Roads and Bridges Committee.

April 12. **BATH.**—Taking down and rebuilding retaining walls and general repairs at the following bridges, for the Somerset C.C.:—(a) Nettle Bridge, at Oakhill, on the main road from Shepton Mallet to Bath; (b) East Chelwood Bridge and West Chelwood Bridge, on the main road from Bath to Weston-super-Mare, near Pensford, Bristol. Specifications and bills of quantities may be obtained from H. T. Chapman, county surveyor, Bath. Separate tenders must be addressed to the County Surveyor, Bath.

April 12. **MIDDLETON ST. GEORGE, ETC. (Durham).**—New Council schools at Middleton St. George, Hartburn and Whitton, alterations and improvements at Usworth Colliery and Littletown Council schools, and Consett cookery centre, for the Durham C.C. Sole tenders are invited. Plans, specifications and general conditions of contract may be seen, and bills of quantities obtained as follows:—Middleton St. George, Harburn and Whitton new schools, at the office of W. Rushworth, Shire Hall, Durham; alterations and improvements at Usworth Colliery, Littletown and Consett cookery centre (plans, specifications and general conditions of contract only), at the office of F. E. Coats, Shire Hall, Durham. Tenders are to be sent to A. J. Dawson, Clerk to the Education Committee, Shire Hall, Durham.

April 19. **HAZEL GROVE (Stockport).**—Erection of a new public elementary Council school on land in Chapel Street, Hazel Grove, near Stocport, to accommodate 800 children, with housewifery, laundry, and cookery centres, and caretaker's quarters, for the Cheshire Local Education Authority. Plans and specifications may be inspected and quantities obtained from the architect, C. T. Adshead, Leinster Chambers, 4, St. Ann's Square, Manchester, on payment of a deposit of £2 2s., on and after Tuesday, March 29. Tenders to be sent to J. W. Bain, Clerk, School Brow, Romiley, near Stockport.

April 21. **BUILTH WELLS.**—Erection of a new mixed and infants' school (346 places), and cookery kitchen, at Builth Wells, for the Breconshire Education Committee. Names to Charles W. Best, M.Inst.C.E., Surveyor to the Committee, County Hall, Brecon, accompanied by particulars of works recently carried out, and the names of two references relative to the quality of the work done.

ENGINEERING.

April 4. **SOUTHAMPTON.**—Construction of tramways in New Road and Northam Road, for the Corporation. Plans, specification, and conditions may be inspected, and form of tender obtained at the tramway offices, upon production of the borough treasurer's receipt for a deposit of £3 3s. Tenders must be left at the Town Clerk's office.

April 4. **GLASGOW.**—Steelwork, etc., required in widening the west side of the bridge carrying Finnieston Street over the Glasgow Central Railway, for the Corporation. Specifications and forms of tender may be obtained on application at the office of Public Works, City Chambers, 64, Cochrane Street. Tenders must be lodged with A. W. Myles, Town Clerk, City Chambers, Glasgow.

April 4. **MACCLESFIELD.**—Laying of about 1,430 yards of 9in., 7in., and 6in. stoneware and cast-iron pipe sewers, with manholes, flushing tanks, and other works incidental thereto, at Prestbury, for the R.D.C. The pipes and castings will be provided by the Council. Plans may be seen by appointment with J. Thorpe, surveyor, 19, King Edward Street, Macclesfield, from whom specification and quantities may be obtained on payment of £1 by cheque. Tenders must be delivered to Frederick May, Solicitor and Clerk to the Council, Macclesfield.

April 4. **FRIZINGTON.**—Supply and erection, complete, of gasworks plant, comprising retorts and fittings, condenser, steam engine, and exhauster, washer, scrubber, purifiers, and gasholder, with steel tank. The plans may be inspected and copies of specifications and conditions of contract obtained, on application to the Surveyor, Council Offices, Frizington, or to the Council's Consulting Engineer, Isaac Carr, M.Inst.C.E., Farnworth, Widnes, upon deposit of £2 2s. Tenders must be addressed to John Bowly, Clerk, Council Offices, Frizington.

April 4. **WELLINGTON.**—Provision laying, and jointing of about 2,350 yards of 12in., 9in., and 6in. stoneware pipe sewers, and about 650 yds. of 5in. cast-iron rising main, together with manholes and lampholes; also the construction of pump-well, engine house, workman's cottage, liquefying tanks, laying out irrigation areas, and other incidental works, for the R.D.C., in accordance with the drawings and specification prepared by the engineers. Drawings and specifications may be seen and bills of quantities and form of tender obtained at the offices of the engineers, Willcox and Raikes, 63, Temple Row, Birmingham, on payment of a deposit of £3 3s. Tenders to be delivered to Jno. Jones, Clerk to the Rural District Council, Edgbaston House, Wellington, Salop.

April 4. **KILLEENA (Queenstown).**—Supplying and laying of 4,225 yards of 12in. stoneware pipe and 326 yards of 9in. cast iron pipe, together with construction of catchwater tanks and other works for the purpose of conveying water from streams in the Townlands of Killeena and Cloneen to the existing storage reservoir at Tibbotstown, for the Queenstown U.D.C. Plans and specifications can be seen at Town Hall, Queenstown, or at the office of the Engineer, P. H. McCarthy, R.E., M.I.C.E.I., 30, Westmorland Street, Dublin. Specification, bill of quantities, and form of tender, will be supplied on depositing £2 2s. The competitor whose tender may be accepted will be required to enter into a formal indenture of contract and bond with the Council, and to find two good and substantial sureties jointly and separately to be bound under a penalty of £500 for the due performance of the contract. Tenders to be addressed to James H. Campbell, Town Clerk, Town Hall, Queenstown.

April 6. **PENWITHICK (St. Austell).**—Construction of a reservoir, near Penwithick. Drawings, specifications, and conditions of contract may be seen at the office of the engineer, H. S. Hancock, Sydney Place, St. Austell, and copies may also be seen at the office of John Stephens, Clerk to the Council, Cross Lane, St. Austell, to whom tenders must be sent.

April 6. **LONDON (for Capetown).**—Installation of a system of ventilation for the additions to the Cape Town Houses of Parliament now in course of construction. Tenders will be received by the Agent-General for the Cape Colony, 100, Victoria Street, Westminster, S.W. Descriptive notes and other information may be obtained from the office of the Agent-General for the Colony, where plans may also be seen. All proposals must give in detail the cost of the apparatus delivered in Cape Town, and also the additional cost for fixing same complete in working order in the buildings.

April 6. **NAAS (Ireland).**—Construction of pipe sewers, manholes, flush tanks, storm overflows, lamp-holes, fences, filters, septic tanks, and concrete effluent carriers, the preparation (including under drainage) of about one statute acre of land for irrigation ground and other works, for the R.D.C., in strict accordance with plans and specification prepared by the Council's Engineer, F. Bergin, B.E. Plans, etc., can be seen at the office of D. J. Purcell, Clerk of Council, Council Offices, Naas, on any day (except on Wednesdays and Saturdays), or at the office of the Council's Engineer, 36, Westmoreland Street, Dublin. Tenders, accompanied by a schedule of prices, and containing the names and addresses of two solvent sureties willing to join in a bond of £500 for the performance of the contract within the specified period, will be received by the Clerk to the Council. The contractor will be expected to give preference to local labour, as far as possible, and he must pay all expenses in connection with the preparation and execution of, and stamp duty on, contract and bond. The acceptance of any tender will be provisional upon the sanction of the treasury being obtained to the loan authorised by the Local Government Board to defray the cost of the works.

April 8. **HUCKNALL TORKARD.**—Re-laying of about 1,820 yards of 12in. and 18in. stoneware and iron pipe outfall sewers, with manholes, etc., alterations to present tanks and filters, the construction of liquefying tanks, percolating filters, storm water tanks, and other appurtenant works, for the Hucknall Torkard Urban District Council. Plans may be seen at the office of the engineers, Sands and Walker, Milton Chambers, Nottingham, and copies of conditions, specification, and quantities can be obtained on deposit of £3 3s. The successful contractor will be required to enter into a bond with approved sureties for the performance of contract. Tenders to be sent to Parker Woodward, Clerk, Council Offices, Hucknall Torkard.

April 11. **LINCOLN.**—Supply and erection of an absolutely watertight steel tank of 300,000 gallons capacity, and subsidiary works at Westgate, Lincoln, for the Corporation. Drawings, specifications and form of tender may be obtained at the office of the engineer, Neil McK. Barron, Waterworks Engineer, Lincoln, upon production of a receipt from the City Accountant for the sum of £5 5s. Tenders, addressed to the Chairman of the Waterworks Committee, to be delivered at the office of W. T. Page, Deputy Town Clerk, Bank Street, Lincoln.

April 11. **PONTEFRACT.**—Execution of a scheme of sewerage and sewage disposal, comprising the laying of about 1,000 yards of main sewers and manholes, relaying of about 1,500 yds. of existing sewers, alterations to precipitation tanks, construction of continuous bacterial and sand filters, effluent pipe, etc., at Cutsyke Sewage Disposal Works, for the R.D.C. Full particulars may be obtained from the engineers, D. Balfour and Son, Civil Engineers, 3, St. Nicholas' Buildings, Newcastle-on-Tyne, to whom applications must be made on or before March 21, and must be accompanied by a cheque for £5. Tenders must be sent to J. Dickon Smith, Clerk, Union Offices, Pontefract.

April 11. **BATH.**—Construction of the first sections of the intercepting sewers, pumping station, internal sewers, and sewage disposal works, for the City of Bath. The works for which tenders are now required are as follows:—Intercepting sewer contract:— These works will comprise about six miles of deep low level main intercepting sewers through the City, consisting chiefly of 36in. to 18in. cast-iron sewers and some stoneware pipe sewers, with manholes and appurtenances; together with five crossings under the River Avon, 2¼ miles of high level iron intercepting sewers, a deep storage tank under the pumping station to hold about 375,000 gallons, small connecting sewers, flush water mains, and various subsidiary works. Sewage disposal contract:— These works will comprise storm-water tanks, six large dortmund settling and precipitation tanks, 16 large bacterial filter beds containing 34,000 cubic yards of filtering material, two circular humus tanks, effluent culvert pipes, carriers, drains, embankments, and various works for the reception of 12,000,000 gallons a day during storms. These works will be constructed on 57 acres of corporation land at Saltford, about five miles from the City. Stone sewers, No. 1 contract:—These works will comprise the replacement of several old stone internal sewers by new brick and pipe sewers, with appurtenant works. Day-work contract:—These works will comprise the laying of several sewers, connections and other work which cannot conveniently be done by ordinary contract. Tenders will be received, especially from local and other builders, for the supply of the various materials and labour enumerated thereon. Conclusion.—Tenders for a number of contracts will be advertised for later on for the construction of the pumping station, two pairs of cottages, disposal buildings, mess rooms, several stone sewer replacements, laying of five miles of pumping main, and other works required when the first contracts are sufficiently advanced to enable these works to be started. The plans may be seen (except on the dates given below) and quantities obtained at the office of the Engineer, W. H. Radford, C.E., Albion Chambers, Nottingham, on deposit of £3 3s. for each of the first two contracts, and £1 1s. for each of the other contracts. The plans will also be on view at the Guildhall, Bath, on March 30 and 31, and April 1. Tenders to be sent to Fredk. D. Wardle, Town Clerk of Bath, Guildhall, Bath.

April 12. **BURY AND RADCLIFFE.**—Widening of Hardy's Gate (County) Bridge, which carries the main road from Bury to Radcliffe, on the border of the county borough of Bury and the township of Radcliffe, Lancashire C.C., the Corporation of Bury, and the U.D.C. of Radcliffe. Plans may be seen and copies of the specification and bill of quantities obtained at the County Bridgemaster's Office, 8, East Cliff, Preston, to whom tenders must be delivered, addressed to the Chairman of the Main Roads and Bridges Committee.

April 12. **DENTON AND HYDE.**—Widening of Broomstair (County) Bridge, situate on the main road from Denton to Hyde, half in the township of Haughton (Lancashire) and half in the borough of Hyde (Cheshire), over the river Tame, for the C.C.'s of Lancashire and Cheshire, the Corporation of Hyde, and the U.D.C. of Denton. Plans may be seen and copies of the specification and bill of quantities obtained at the County Bridgemaster's Office, 8, East Cliff, Preston, to whom tenders must be sent, addressed to the Chairman of the Main Roads and Bridges Committee.

April 14. **EGYPT.**—Sewage pumping plant, for the Egyptian Government. Copies of the conditions of tender, etc., may be obtained on application from A. L. Webb, C.M.G., Queen Anne's Chambers, Broadway, Westminster, London, S.W., and the Commercial Intelligence Branch of the Board of Trade, London. Copies of the detailed description of work, together with plans, etc., can be obtained upon payment of the sum of £5 2s. 6d. from the office of A. L. Webb.

April 16. **ROCHDALE**—Construction of a covered service reservoir (capacity two million gallons), on land belonging to the Corporation adjacent to Thornham New Road, in the Borough, and about 2¾ and 2 miles respectively from the Rochdale and Castleton railway stations of the Lancashire and Yorkshire Railway, for the Corporation. The drawings may be seen and a copy of the specification and form of tender, with schedule of quantities, may be obtained (on deposit of £5 5s.) at the offices of H. Rofe and Son, Civil Engineers, 8, Victoria Street, Westminster, S.W., and Oxford Chambers, Victoria Square, Leeds. Tenders to be sent to Wm. Henry Hickson, Town Clerk, Town Hall, Rochdale.

IRON AND STEEL.

April 4. **MANCHESTER.**—Supply of about 615 tons of cast-iron water pipes, 3, 4, 5, and 6ins. diameter, with about 100 tons of special castings, for the Waterworks Committee of the Corporation. Specifications, etc., may be obtained on application to the Secretary, Waterworks Offices, Town Hall, Manchester, on deposit of 10s.

PAINTING.

April 6. **LONDON, E.C.**—The Metropolitan Asylums Board invite separate tenders for the following works:—(1) Cleaning and painting and repairs at (a) the Grove Fever Hospital Hospital, Tooting Grove, Tooting Graveney, S.W., and at (b) the North-Western Fever Hospita., Lawn Road, Hampstead, N.W.; (2) cleaning and painting and repairs at (a) the Western Fever Hospital, Seagrave Road, Fulham, S.W.; (b) the Brook Fever Hospital, Shooter's Hill, Woolwich; (c) the South-Eastern Fever Hospital, Avonley Road, New Cross, S.E.; (3) alterations to discharge block at the North-Eastern Fever Hospital, St. Ann's Road, Tottenham, N.; (4) road repairing and tar paving work at the Western Fever Hospital, Seagrave Road, Fulham, S.W., in accordance with drawings, conditions of contract, and specification prepared by W. T. Hatch, M.I.C.E., M.I.M.E., Engineer-in-Chief. The conditions of contract, specifications, and forms of tender—also drawing in the case of the North-Eastern Hospital, and bills of quantities in the case of the Grove and North-Western Hospitals—may be inspected at the office of the Board, Embankment, E.C., and can be obtained upon payment of a deposit of £1 in respect of each work. Tenders must be delivered at the Office of the Board.

April 7. **CHELSEA.**—Painting and repairs required at Onslow Dwellings, Pond House, and Sir Thomas More Buildings, for the Borough Council, in accordance with the conditions, specification, and form of tender, copies of which ,together with information respecting the same, may be obtained at the office of the Borough Surveyor, T. W. E. Higgens, at the Town Hall. Tenders must be enclosed in the printed envelope obtainable therewith, and must be placed in the box provided for that purpose in the office of Thomas Holland, Town Clerk, Town Hall, King's Road, Chelsea, S.W.

ROADS AND CARTAGE.

April 4. **MIDDLETON.**—Supply of setts, flags, sanitary tubes, granite, macadam, etc., for the Corporation. Application for information forms of tender, etc., to be made to F. Entwistle, Town Clerk, Middleton.

April 4. **SOUTH STONHAM.**—Supply of:—Cherbourg quartzite, or British macadam and flint, for the R.D.C. The stone to be delivered at the various railway stations or wharves at such times and in such quantities as the District Surveyor may direct. Forms of tender may be obtained at the office of E. T. Westlake, Clerk, 20, Portland Street, Southampton (to whom tenders and samples must be sent), or of the District Surveyor, W. J. Potter, "Glenroy," Portswood, Southampton.

April 4. **WICKHAM MARKET (Suffolk).**—Supply of about 3,000 tons of granite, broken to 1½in. gauge, delivered in trucks at the following stations, before July 31, 1910: Aldeburgh, Framlingham, Marlesford, Parham, Saxmundham, Snape, and Wickham Market, on the Great Eastern Railway, and Kenton, on the Mid-Suffolk Light Railway, and in barges alongside Orford Quay and Iken Cliff, in the River Alde, for the Plomesgate Rural District Council. Tenders, with samples, to be sent to T. Waller Read, clerk, Board Room, Wickham Market. Forms of tender may be had on application to the Clerk.

April 4. **PLOMESGATE.**—About 3,000 tons of granite, broken to 1½ inch gauge, delivered in trucks at the following stations, before July 31, 1910:—Aldeburgh, Framlingham, Marlesford, Parham, Saxmundham, Snape, and Wickham Market, on the Great Eastern Railway, and Kenton, on the Mid-Suffolk Light Railway, and in barges alongside Orford Quay and Iken Cliff, in the River Alde. Tenders, with samples, to be sent to T. Waller Read, Clerk, at the Workhouse at Wickham Market, Suffolk. The Council reserve the right of accepting a portion of any tender to the exclusion of the remainder. Forms of tender may be had on application to T. Waller Read, Clerk, Board Room, Wickham Market.

April 6. **LYDD.**—Supply and delivery (free on rail, at Lydd Station) of road material, for the T.C. —450 tons 1½ gauge Rhenish columnar basalt; 20 tons 1¼in. gauge Rhenish columnar basalt; 10 tons ⅝in. chippings. Material to be delivered at such time as Surveyor may direct. Tenders, also samples, must be sent to Thomas Kettle, Borough Surveyor, Lydd. No form of tender supplied.

April 6. **WANSTEAD.**—Making up the street known as Warwick Road, for the U.D.C. Copies of specification and form of tender can be obtained and contract form inspected at the Council Offices, Wanstead, N.E., (Surveyor's Department). Tenders are to be delivered at the Council Offices, Wanstead, N.E.

April 7. **EASTBOURNE.**—For the supply of road materials (stone, flints, beach, and stone chippings), and for cartage of same from railway stations, for the R.D.C. All materials will be required to be delivered before Sept. 30. Tenders to be addressed to the Chairman of the R.D.C. at the Board-room of the Eastbourne Guardians, Avenue House, Eastbourne. Forms of tender may be obtained from T. E. Varley Kirtlan, clerk, 92, Terminus Road, Eastbourne, or C. M. Carter, Mount Sorrell Hampden Park, near Eastbourne, on forwarding stamped addressed foolscap envelope.

April 11. **WANDSWORTH.** — Making up and paving of that part of Copley Park, Streatham, which lies between Streatham Common South and Heybridge Avenue, for the Borough Council. The specification and drawings may be seen, and forms of tenders obtained at No. 56, East Hill, Wandsworth, S.W., upon payment of a deposit of £5 5s. Tenders must be delivered at the Council House, East Hill, Wandsworth, S.W., and may be placed by the person tendering in the box provided for the purpose. Persons tendering must in the case of all workmen employed by them pay wages at no less and observe hours of labour not greater than the rates and hours recognised by the associations of employers and employees and in practice obtained in the district where the work is to be executed.

April 11. **BRIGHOUSE.**—Repaving of a portion of Birds Royd Lane with granite setts on concrete (the setts to be provided by the Corporation). Plans and sections may be seen, and specification and bills of quantities obtained upon application to S. S. Haywood, Borough Engineer and Surveyor, Municipal Offices, Brighouse. Tenders, accompanied by the priced bill of quantities, to be sent or delivered to Jas. H. Rothwell, Town Clerk, Town Clerk's Office, Municipal Offices, Brighouse.

April 11. **BECKENHAM.**—Making-up of Faversham and Shaftesbury Roads, for the U.D.C. The works comprise the following:—130 cubic yards, flint, 1900 lin. ft. second-hand channelling, 735 super. yds., Burgess Hill paving (bricks supplied), together with the remodelling of about 1,500 super. yds. of roadway. Plans and sections may be seen, and bills of quantities, specifications, and forms of tender obtained, on application to John A. Angell, Surveyor, on the production of a receipt from the collector (who attends his office daily from nine to ten a.m. only, except on Tuesdays, when his hours are from nine a.m. to one p.m.), for a deposit of £2. A clause will be inserted in the contract providing that the contractor shall (1) pay to the employees the wages generally accepted as current for workmen engaged on similar work in the town where the work is executed, and (2) to the extent of 75 per cent. at least of the staff required in the execution of such works give preference to and engage such competent workmen of the class required as may be bona-fide residents in the parish of Beckenham, and may offer themselves for employment. Payment under the contract will not be made until six months after the completion of the works. Tenders to be sent to F. Stevens, Clerk to the Council.

April 14. **WESTMINSTER.**—Paving work within the jurisdiction of the City Council. Conditions of contract, specification, schedule, and tender can be obtained on application at the Town Clerk's Office, Westminster City Hall, Charing Cross Road, W.C. The contractors will be bound by the contract in the case of all workmen employed by them, to pay wages at rates not less and observe hours of labour not greater than the rates and hours recognised by the Associations of Employers and Employees, and in practice obtained in the district where the work is to be executed. The contractors are prohibited from directly or indirectly canvassing members or officials of the Council in reference to any tender, and the tender of any contractor who does so canvass will be rejected. The contract deeds will be prepared at the expense of the Council, and the contractors will be required, together with two sureties, to enter into bonds for the due fulfilment of their contracts, or, in the alternative, to agree to the retention by the Council, during the period mentioned in the form of tender, of certain moneys. Each tender to be addressed to "The Town Clerk, Westminster City Hall, Charing Cross Road, W.C." Tenders may be placed by, or on behalf of, tenderers in a locked box at the City Hall, provided for the purpose.

MISCELLANEOUS.

April 5. **SOUTHAMPTON.**—(1) Laying soil sewer, Brookvale Road; (2) laying storm water sewer, Oakley Road; (3) private street works, Shirley Park Road; (4) erection of tipping platform and shelter, etc., at Corporation Wharf, for the Corporation. Plans, specifications, and conditions may be seen and bills of quantities and forms of tender obtained at the Borough Engineer's Office, upon production of the Borough Treasurer's receipt for a deposit of £1 1s. in respect of each contract. Tenders must be delivered at the Town Clerk's offices, Municipal Offices, Southampton.

April 20. **HORSHAM.**—Tar paving of the playgrounds and incidental work at the Horsham Southwater Council school, for the West Sussex Local Education Authority, situate about three miles from Horsham and within half a mile of the Southwater Railway Station (L.B. and S.C.R.). Specifications and forms of tender will be forwarded on application to Lionel Thompson, Secretary, Education Offices, Horsham, Sussex, to whom tenders must be sent.

Ex Cathedra.

FROM one who has been appointed to what, in University parlance, might be called the "chair" of consulting editor to this journal, which appears this day under a new or rather an additional title implying a wider scope, a word of greeting to its readers may not be out of place. First let me say that the change or extension of the title, from "The Builders' Journal" to "The Architects' and Builders' Journal," by which latter name this paper will henceforth be known, is one that I entirely support. The paper under the original title has attained great success as a journal particularly on the practical side of the architectural art. Without in any way giving up this practical character, it was the intention, when I was asked to assist in its counsels, that the scope of the paper should be extended so as to include a greater attention to the artistic side of architecture, and to the arts connected with that central art; and an alteration of the title, so as to express this change, would in any case have followed sooner or later. On my advice it was decided, however, to adopt at once the title which expressed the change, rather than defer it to what might, perhaps, seem the more convenient season of a new year or a new volume.

Most of those who will read these words will have known my name for a good many years in connection with another architectural journal. The circumstances which have led to the change concern no one but myself. All I need say here is that I am now free to devote my energies to working with and for those whose primary object is to render this paper the leading journal for architects. Beyond these few words, which I hope will not be considered out of place in the circumstances, my personality will not in future be intruded on the readers of this journal; but my services as a critic on architectural subjects, with whatever value has attached to them in the past, are now transferred to the columns of "The Architects' and Builders' Journal."

H. H. STATHAM.

Literature and Architecture.

THERE seems to be a spasmodic tendency, now and again, to disparage all writing about architecture as something altogether unnecessary and beside the mark. Did we not hear, only a few days ago, of a thesis started as a *point de départ* in a certain architectural debating society: "Are books on architecture of any value?" The question was perhaps framed with the express object of provoking retort; it could hardly have been propounded quite seriously. In the first place, architecture itself, in its existing monuments, is so fascinating a subject that its form and its records well deserve to be enshrined in those costly folios of description and illustration which are among the most beautiful productions of the art of bookmaking, and the most decorative treasures of a sumptuously stored library. There are few things more attractive to the eye and the fancy than the sight of a shelf-load of monumental volumes in which, with the toil of years, the illustration of some important phase of architecture has been adequately carried out. They symbolise, in a way, the importance and the dignity of the art. We should have small sympathy with anyone who could look over such a collection without feeling his architectural fervour stimulated thereby.

And as to the utilitarian side of the question, is there no use, for example, in the record of the careful measurements of the most perfect building in the world; or is it to be supposed that we ought, each of us, to ignore all the facts drawn in Penrose's volume, and go and measure the Parthenon again for ourselves? Or is Fergusson's vast *aperçu* of the history of architecture, the work of almost a lifetime, a thing of no value?

However, these heresies we hear from time to time: and if they are directed against permanent and monumental publications, *a fortiori* we must suppose that the mere ephemeral literary tribute of a weekly journal is to be contemned as valueless; and, indeed, we hear of discriminating subscribers who cut the illustrations out of a journal and throw the rest away. If they are right, it is the fault of the journal. Otherwise, it may be an indication of a rather narrow range of sympathies and education. It does not follow that because the ultimate end of architecture is the production of good

buildings, all writing about the subject is useless—even to that end.

Let us consider the main objects which may be kept in view in the pages of a journal devoted to architecture. The first, and the most simple and obvious one, is the mere giving of information as to what is going on in the world of architecture and building; what buildings are completed, and what new ones, or competitions for new ones, projected. That is almost what one may call the mechanical part of journalism, dealing with a special class of subject; its great merit is to be accurate; but if accurate, it is of more than immediate value. It is a record of fact which may be of service for after reference.

The further step is, to give information on practical subjects connected with new materials or methods of construction; that is the scientific side of the enterprise, and is a very important one; by many members of the profession it seems to be regarded, in fact, as the only important element in a professional journal. We want what will help us in our daily practice, they say in effect; all the rest is padding that we can do without. That also is a somewhat narrow view of the subject; a point to which we will presently return. For the moment we may observe that it is important that this scientific information should be not only accurate and learned in itself—furnished by men competent to instruct others on the subject (which it is the business of the editor to see to), but that it should be entirely unbiassed; an object not so easily obtained as is sometimes supposed. Experts in some special form of construction have sometimes an interest in its use, direct or indirect; or, without being interested in that sense, have their own special preferences for a favoured method or a favoured form. All these disturbing influences have to be discounted, if the instruction given is to be what Bacon calls "dry light." In the lay press of this country the conditions are quite otherwise. Readers would be astonished could they know how many newspaper paragraphs recommending this or that invention are really written by the people concerned in making money out of it. Such pitfalls should, at all events, never occur in a journal backed by professional knowledge.

But this practical information, after all, is not architecture; it is only the means to architecture; the structural basis on which, as on a solid rock, the palace of architecture should rest. Architecture is the expression of beauty and of character in building. And this is a matter of designing, of drawing, you say; and writing about it is not designing. But is there nothing to be said on the subject that is worth saying? Is modern architecture, for instance, to be a matter of tradition, of imitation and combination of accepted forms; or is it to be a matter of individualism and invention? Upon the answer to such a question hangs the whole present and future of modern architecture. If the subject can be cleared up by any literary discussion, surely that need not be labour or type wasted. It is, in part at least, by thinking over such problems, considering them from all sides, that we may come to a decision as to what to aim at. That is what architectural criticism, in the higher sense, really means. It is an endeavour to ascertain our right direction; no unimportant object in connection with an art so abstract, so little governed by the example of nature, as architecture. The painter and the sculptor have at least the natural figure or the natural landscape to keep their aims within definite limits; outside of those models they may not stray beyond the extent allowed by certain conventions of treatment. But the architect has no such limitations of form before him; he works towards an ideal which is in his mind, but not in nature. It is a matter of thought which may from time to time be cleared up by discussion. As a poet has said, when urging that two minds to a subject are better than one—

"Thought disentangles running o'er the lip."

May it not disentangle running through type, too? And there is the sacred duty, also, of promoting enthusiasm in architecture, in which words may be by no means powerless. There is perhaps not a single proposition in Ruskin's "Seven Lamps" which is in itself incontrovertible; yet who ever read it without having his enthusiasm quickened? And it is with the same end, of stimulating enthusiasm, that the study and illustration of the architecture of the past should not be neglected. It is a poor sort of spirit that says, or thinks, that such studies are of no practical use; give us something that assists us in our practice of to-day. That is to make of architecture a profession rather than an art. The contemplation of all the great things in the architecture of past ages should be a source of inspiration. "Practical" is a dangerous word; it often comes terribly near to meaning "prosaic"; and he who has not fed his mind on the great architecture of the past is not very likely to produce great architecture in the present.

It is a humbler but not unimportant function of architectural literature, more especially in its journalistic form, to be able to say the right thing at the right moment, and more especially to give a word of support, when it is likely to be of effect, to a measure or an opinion which has been the subject of discussion and difference, and where perhaps neither side sees the matter in all its bearings. A few words calling attention to the real issue which underlies a discussion, and supporting what appears to be the better side in it, may serve to give voice, not without effect, to what perhaps others think but have not the opportunity of saying.

For all which reasons it may be contended that writing about architecture is not necessarily an entirely useless exercise of the faculties.

The Science of Stained Glass.

IT is noteworthy that recent years have seen many valuable contributions by scientific men to the study of architecture and the allied arts. The paper read by Mr. Noel Heaton before the Royal Society of Arts, of which a short abstract appears on another page, is an instance in point, for it adds much useful information to our knowledge of the scientific basis of stained glass design. The elucidation, analysis, and comparison of the materials and methods employed in any of the crafts is not merely a guide to the present-day craftsman, but is also valuable in disclosing some of the secrets by which our forefathers obtained effects which we envy but cannot reproduce. It is not merely interesting but extremely useful to learn from Mr. Heaton that the mediæval glassworker obtained strong, vigorous lines in his glass-painting by using an intense colour flux to seal his pigment on to the glass canvas—to borrow a painter's term—of his picture. By the use of such a flux he strengthened and gave body to the particles of his pigment; whereas the modern craftsman, using a colourless or transparent flux, depends solely on his pigment particles, and his lines are apt, in consequence, to look broken, or "rotten." It is not surprising, perhaps, to learn that the Gothic—and especially the late Gothic—glass was less durable than either the Roman that preceded it or the modern that followed it. We are sufficiently removed from the Gothic Revival to appreciate the wonders of the Mediævalists without crediting their infallibility. But a conclusion one can hardly escape in reading Mr. Heaton's paper is that the Mediævalist obtained some admirable effects in his glass through the limitations both of his technique and of his plant. The primitive nature of his furnaces and appliances resulted in the production of glass that was very imperfect or very perfect, according as you regard it from the purely utilitarian or the æsthetic standpoint. The irregular thickness and the "reaminess" caused by slight variations of compositions in different parts of the sheet are defects; but it was these very defects which caused the light passing through it to become irregularly refracted and partially diffused, and so conferred on Gothic glass that peculiar character for which it is famous. The Gothic craftsman triumphed, therefore, either because of his limitations or in spite of them.

"Vandalism in South London"

A RESIDENT in Camberwell Grove has written a bitter letter of complaint to "The Times" about the manner in which the Camberwell Borough Council has been treating the trees in that thoroughfare; and has thereby provoked a spirited controversy in the columns of our contemporary, to which Sir Aston Webb, R.A., and Mr. Arthur Severn have contributed. From the Town Clerk's statement it seems that this lopping has been undertaken to remedy complaints of obstruction to traffic, light and air, dampness to houses, etc., but it is the contention of the Camberwell Grove resident that the work has been undertaken for the benefit of the unemployed, who, from his point of view, would have been better occupied in digging holes and filling them up again. The debatable point as to the necessity or otherwise of the work, and whether it could have been done differently is now beyond the range of profitable discussion; but the suggestion of Sir Aston Webb is well worth consideration and development. If we grow forest trees on the edge of the pavement, they will, unless pruned and controlled, undoubtedly become troublesome both to the street traffic and to the houses. It is the distinguished architect's idea that "now that street tree planting has become so general with us, and is a matter that greatly affects the beauty and healthiness of our streets, our local authorities should hold a joint inquiry into the best treatment of street trees alike from the horticultural, the æsthetic, and hygienic sides, as exemplified not only in our English towns, but also on the Continent, especially in France; and that, after taking the opinion of those best able to give advice, an authoritative statement of suggestions should be drawn up which would form a reliable guide for those who have charge of our trees in the future, and while ensuring some uniformity of treatment might at the same time serve to reassure the public that, while the trees were being carefully tended, their own interests and also the beauty of the streets were being duly considered." That system seems to us to embody the common sense of the matter. In particular, we should like to repeat here our former contention that in any scheme of street tree planting the trees should adorn and not obscure the houses, and should be a source of unalloyed pleasure, and not a general nuisance.

"Architects and the Public."

UNDER this title Mr. W. Shaw Sparrow, who writes rather as if he was the instructor of the world about architecture, has an article in "The New Age" which includes one point worth attention. He repeats, and rather forcibly, the criticism, which has not infrequently been made by people outside the profession, on the 5 per cent. system of charging for an architectural design and the surveillance of its execution, as leaving it open to a client to feel that the architect is consulting his own interest whenever he proposes an enlargement of a scheme. Few clients, perhaps, really think so, but there are some who do, and the idea that the client may have such a suspicion is not a pleasant one. But one of the principal other objections to the five-per-cent. system is that it allows nothing for exceptional talent or exceptional fame; the gifted architect is supposed to command no higher terms than the unknown beginner; and if he is to make the most of his abilities, it must be not by charging on a higher scale, but by accepting more commissions, and hence undertaking more buildings than he can give personal attention to. There is more in this than architects have quite realised. Mr. Sparrow quotes a remark made to him which is worth requoting:—

> If I buy from Tadema a beautiful picture of Roman life, and pay him £3,000, I know for certain not only that the work is entirely his own, but that he has given to it months of undivided thought and loving care. On the other hand, if I build myself a house for £60,000, I am likely to hear that my famous architect at the same moment has several such houses in hand, as well as a large public building. Is that any pleasure to me? Am I satisfied with occasional visits from my chosen servant? I would sooner pay him four or five thousand pounds and have all his time for a year. I am afraid of a large office staff in architecture, as I am of school pictures by Rubens.

It is impossible to deny that there is truth in that, and that five per cent. and the "large office" staff is a system which tends to produce mechanical architecture. It is true that it is a system consecrated by long usage, and that it saves trouble to some extent; but if architecture is really an art, and not a trade, there is no logic in paying for it on a basis of financial outlay. The Institute have now under consideration the revision of their schedule of architectural charges; cannot they at least insert the thin end of the wedge by stating that any member is at full liberty to arrange his own terms with his client, if he prefers that to five-per-cent; provided always that he does not descend to lower terms than the five-per-cent. would have amounted to? That this course has been suggested by some of their correspondents, in answer to questions recently circulated by the Institute, we know. One would prefer that there should be no mention of a minimum charge; but until the public is educated up to a proper sense of architecture and the dignity of an architect's calling, its deletion would place respectable practitioners, especially in the provinces, at the mercy of their less scrupulous brethren and those erring public bodies who ask architects to compete on the basis of professional remuneration. But as long as the Institute document lays down five per cent. as the legal basis for an architect's charge, architects will be nervous at adopting any other system, for fear that a court of law should refuse to recognise their claim. Let the Institute Council once say boldly that five per cent. is the minimum charge, and that an architect is at liberty to arrange his own charges as he pleases above it without derogating from professional etiquette, and the door will be opened for what would be a better state of things, certainly for architecture, and probably for architects.

THE LOPPED TREES IN CAMBERWELL GROVE, CONCERNING WHICH A SPIRITED CONTROVERSY HAS BEEN PROVOKED, IN WHICH SIR ASTON WEBB, R.A., HAS JOINED.

NOTES AND NEWS.

The Amenities of Richmond.

There are more ways of killing the proverbial canine than hanging him. Some weeks ago we commented on the difficulties of the Richmond (Surrey) Corporation in preserving the amenities of their greatly favoured district, and in particular with the opposition of the townsfolk generally to the erection of a tall red-brick block of flats on the site of Ancaster House, an old Georgian mansion standing just by the Park gates. The Corporation has been able, under one of its by-laws, to defer the scheme for some considerable time, but weighty support to the opposition has been received from an unexpected quarter. Doubtless the great attraction and the money-making possibility of this building scheme to the promoting syndicate was the uninterrupted view which the flats would enjoy over Richmond Park. But H.M. Office of Works, as custodians of the Park, are not impressed with the scheme, and Mr. Lewis Harcourt and his advisers have decided, and already started, to plant a thick belt of quick-growing trees along their side of the fence, which will speedily efface any pleasant prospect which these flats might have enjoyed. It is considered that this counter move will prove a bar to the further continuance of the scheme. One can, of course, sympathise with the syndicate's point of view, and their disappointment at this setback to a promising building speculation. But there are certain places so richly endowed by Nature that they should not be unduly exploited, and we think Richmond is one of them.

* * *

The Town Planning Act.

The Local Government Board have issued instructions for the guidance of their inspectors in cases of public local inquiries under Section 39 of the Housing and Town Planning Act. Under these the inspector has power to summon persons for examination on any matter relating to the subject matter of the inquiry; he has also power to adminster an oath, or to require a witness to make and subscribe a declaration.. If the inquiry relates to an appeal under section 15, section 17, or section 18 of the Act, the inspector, either during or after the inquiry, shall visit and inspect the premises to which the appeal relates, and shall invite the parties to the appeal to accompany him. If, however, the inquiry is held in regard to an appeal against a demand for the recovery of expenses or an order with respect to those expenses under section 15 (6), the inspector need not make such visit and inspection unless the circumstances appear to him to require it or unless either party to the appeal desire it. The instructions also cover the manner in which the evidence should be taken, and in which the inspector should make his report to the Local Government Board.

Puddletown Church.

A strong rejoinder to the various criticisms passed upon the proposals for restoration at Puddletown Church has been made by the Rev. J. G. Brymer, the patron of the benefice. It appears that the Perpendicular chancel was pulled down in 1576, probably "through a desire to curtail the rectorial liability of repair." With the stone of this chancel was built in the village a house known as Stayles House. The house is now in a decayed state, and Mr. Brymer proposes to pull it down and re-erect the chancel with the stone, thus restoring to it what it lost in the 16th century. He considers it not unlikely that the foundations of the original chancel will be discovered. It is not intended to alter any of the existing features of antiquarian interest. The pulpit will be restored to its original position, the painted deal at the back of it removed, and the stairs to the rood loft revealed. The Archdeacon of Dorset, in defending the proposals, also in the "Dorset County Chronicle," says: "Perhaps it is not fully understood that the suggestion is to reconstruct the chancel, which (like those of both the churches in the parish of which I have charge) was for the most part pulled down in the 16th century. It is fully intended to preserve all those characteristic features which we value so highly, the east end being re-erected stone for stone, the three-sided altar-rails retained, and the panelling replaced. While the pulpit would be set back to the position which it occupied until 1850, the body of the church, the Athelhampton Chapel, the gallery, and the oak work would be unaffected." Nothing is proposed to be done, as it appears, which would detract from the antiquarian interest or the historic character of the church

The Earliest House-boat.

Successful spade work, and the publications describing its results, is having a revolutionary effect on our knowledge of the ancient practitioners of the arts and crafts. The inhabitants of Niffer, which is identified with the Biblical Calneh, founded by Nimrod or Merodach, are fortunate in having for their historians the energetic band of explorers who have the University of Pennsylvania for headquarters, whence has been recently issued "The Earliest Version of the Babylonian Deluge Story, and the Temple Library of Nippur." The original "books" on which this volume is based consisted of 433 pieces, mostly of unbaked clay, covered with hardened clay from the adobe walls under which they were buried. These tablets were unearthed by the fourth American expedition at the Tablet Hill Mound, which, in Professor Hilprecht's opinion, covers the ruins of the Temple Library, the school, and part of the archives of the older period. This building was probably in ruins about 2,000 years before the beginning of the Christian era! Yet, even at that remote period, civilization was sufficiently far advanced to include tablets showing grammatical paradigms and phrases, geographical lists of mountains and countries, lists of plants and animals, weights and measures, chronological lists, medical prescriptions, mathematical data, and a number of other subjects of intellectual interest. The Babylonian version of the Flood affords Dr. Hilprecht the opportunity (which perhaps no *savant* outside America would have had the courage to seize) of translating the work for ark—the very alluring word *magurgurrums*—as "house-boat."

* * *

Enduring Brickwork.

In uncovering the fine stone bridge over the moat at Hampton Court Palace, some interesting discoveries have been made. In the wall of the north wing, under Lady Gifford's apartments, two large archways have been revealed, evidently designed to bring the water into the moat; and on the south side have been found some curious brick steps leading by an archway into the moat from a subterranean way underneath the rooms now occupied by Lord and Lady Wolseley. There is much, says Mr. Ernest Law, in the "Times" of March 25th, which points to the waters of the moat being utilized to flush the vast system of arterial drainage which was one of the main features of Wolsey's palace. The brickwork of both the moat wall and the main building, though buried for 200 years, has mostly been found in as satisfactory a state as the stonework of the bridge. Where it was otherwise, it has been carefully patched with the old Tudor bricks. Tens of thousands of these—unrivalled for their texture and their varied tones of rich colour, extending from dark purples and crimsons to bright rose—have been collected from the *debris* and put aside for the restoration.

* * *

Old-time Prices.

The moat wall at Hampton Court was not built until six months after the bridge, namely, in the spring of 1536, but Henry VIII. was as much in a hurry for its quick completion as he had been in the case of the bridge. Labourers were accordingly employed by the score to hasten on the building of the wall and to work day and night. They were paid 5d. a day instead of the customary 4d., while those who were engaged in lading the water out of the foundations of the brick wall in the moat, by the stone bridge, were paid the very special rate of 6d. a day. Many fragments of moulded and carved stonework, old encaustic tiles, tools and instruments, and other objects of interest, have been discovered during the five months' excavations. The cost of the work, so far, has amounted to no more than £1,400.

* * *

The Greenock Housing Question.

As might have been expected, the housing accommodation report by the deputation sent by the Government torpedo factory workers who are about to be transferred from Woolwich to Greenock has caused much indignation in the West of Scotland. It is contended that the report exaggerates the facts, and that housing conditions in Greenock are "as good as anywhere in Scotland"—a phrase that seems almost provocative of repartee. What is more to the point, Lieutenant Acklow, on behalf of the Woolwich men, has written to the Greenock Corporation urging them to enter into a building scheme. It is of course regrettable that Scottish susceptibilities should have been offended, and apparently Lieutenant Acklow has taken the right course in explaining that the gist of the objection is mainly to be found in the difference in point of view as regards North and South. The conditions in the North are not necessarily worse than those in the South. They may be merely different, and the difference is keenly felt. By-and-by, there is to be a garden city in the Greenock district; but by the time this materialises the invading Southrons may have become accustomed and reconciled to their new surroundings.

* * *

"False Front" Beautification.

An interesting attempt at harmonizing the visible architecture of the principal street of a village is in progress at Wheaton, Ill. Wheaton is a small village 25 miles west of Chicago, beautifully situated and laid out, and with many attractive residences, but its two or three blocks of business premises are decidedly commonplace. Plans have recently been made for building a false front on all the buildings in these blocks, the aim being to treat the aggrega-

THE NEW ENTRANCE TO THE MALL FROM CHARING CROSS: AS VIEWED FROM THE MALL. SIR ASTON WEBB, C.B., R.A., F.R.I.B.A., ARCHITECT.

Now that the hoarding has been cleared away a good view can be obtained of the New Entrance to the Mall, which forms part of the Queen Victoria Memorial Scheme. The wings on either hand provide additional offices for the Admiralty and an official residence for the First Lord of the Admiralty.

tion as a unit, but without material alteration of the remaining parts of the structures, and with sufficient diversity to preserve the distinction between separate buildings. The sketches that have been prepared indicate a following of old English village architecture, with gables and outside timbering in place of the present box effect with level sky lines. It is proposed to effect the transformation by covering the fronts with steel lath or expanded metal, and laying upon this a covering of concrete. It is argued that apart from the improvement from an artistic point of view a certain amount of protection from fire will also be afforded by the change. Another suburban village of Chicago, Lake Forest, has under consideration a somewhat similar plan of beautification. We dislike to say anything that may appear to be out of sympathy with any aspiration towards beauty, but we must confess to a strong, and perhaps unreasoning, dislike to this awfully sudden conversion at the hands of the beauty doctor. What on earth can Chicago have to do with old English village architecture, sham or real? The false-fronted shops in Wheaton, Ill., will give mainly the irritating impression of a sham-antique exhibit at some "World's Fair."

London's Cheapest Flats. The "Sam Lewis" flats, which will be inaugurated to-day, have been erected in the Liverpool Road, in accordance with a bequest by the late Mr. Sam Lewis, who left £500,000 for this purpose. For two shillings a week, a two-room flat, including bath, may be had; while for slightly higher rents families of workers with incomes under 25s. per week can obtain three-roomed flats furnished with a bath fitted with hot and cold water, free chimney sweeping, and the free use of venetian blinds. Under these conditions some 1,520 persons will be housed in luxury. The buildings were designed by Messrs. Joseph and Smithem.

ARCHITECTS OF THE DAY.

XI.—MESSRS. BUCKLAND AND HAYWOOD-FARMER OF BIRMINGHAM

[The firm of Messrs. Buckland and Haywood-Farmer and their work will be well-known both in Birmingham and to our readers. In adding their portraits to our gallery of Architects of the Day we give some particulars of their work, accompanied by some illustrations of their most recent buildings, the exigencies of space not permitting as full a selection as we desired.]

The Birmingham School has become a recognised term in architectural circles, and it is almost needless to add that this distinction is based upon the excellent work that Birmingham architects have produced in recent years. It is also curious to note how many names of well-known members in the Birmingham school begin with the second letter of the alphabet—Mr. W. H. Bidlake, Messrs. Bateman and Bateman, Mr. J. L. Ball, Mr. Butler (of Crouch and Butler), and Mr. H. T. Buckland (of Messrs. Buckland and Haywood-Farmer). The last-named firm, who are the subjects of our notice, have designed a good deal of the domestic work for which the Birmingham school is so justly celebrated.

With regard to personal details, it is nearly always difficult to extract these from architects, who are, generally speaking, a diffident race. Mr. Buckland, like many another true artist, does not "imagine that his biographical data are likely to be of the slightest interest to anyone," as it appears to him that "it is only a man's work which really interests others engaged in the same profession." Such modesty is very charming; but it discounts the well-ascertained phenomenon that at least nine out of ten normally constituted men are positively avid of biographical details, which, indeed, as some philosophers hold, may actually help to a better understanding of a man's art. Mr. Herbert T. Buckland, then, was born in 1869, at Barmouth. His earlier progenitors came from Crudwell, in Wiltshire. He was educated in Birmingham, first at a preparatory school and after at King Edward's Grammar School.

It was his boyish ambition to become a mechanical engineer. Accordingly, as a preliminary to being articled, he went, at the age of sixteen or seventeen, into the workshops of the famous firm of Boulton and Watt, at Soho, for a few months on trial. The result was complete disillusionment.

Mr. Buckland considers that he drifted into architecture by pure accident. Disillusionment having led to indifference, the lad entered without enthusiasm into articles with Mr. Henry Clere, quantity surveyor, Birmingham. At the very outset young Buckland joined the Birmingham Architectural Association and, in particular, became closely acquainted with Mr. C. E. Bateman, who had then just gone into partnership with his (Mr. Bateman's) father. Mr. Clere did the quantities for this firm, and his and their offices were in the same buildings. Buckland, having a good deal of spare time at his disposal, assisted the Bateman's with some of their drawings. This experience, and attendance at the Birmingham Architectural Association classes, gradually imbued him with an interest in architecture, and on completing his articles he went into the office of Messrs. Bateman. After two or three years Mr. Buckland purchased a share in the business of Mr. Clere. The firm then undertook architectural work, and among their first commissions were alterations and additions to the Navigation Inn at Bromford, near Birmingham, a drawing of which, by Mr. Buckland, was hung in the Academy about sixteen years ago.

After two or three years the partnership with Mr. Clere was dissolved, Mr. Buck-

UNIVERSITY OF ILLINOIS

land taking over the architectural work. Among his early work was a large block of cottages at Bromford, one of his drawings of which was hung in the Academy. The first competition he won was for a large block of business premises at Plymouth. Mr. Buckland declares that he owes practically all his architectural education to Mr. Bateman and to the Birmingham School of Art, where Mr. Bidlake took the class in architectural design. For several years he was secretary of the Birmingham Architectural Association, and was for a year or two vice-president. For twelve years Mr. Buckland took classes in architectural design at the Birmingham School of Art, first as junior to Mr. Bidlake, and for one year with Mr. Bateman. Afterwards Mr. Buckland took the senior class, with Mr. E. F. Reynolds as junior.

Mr. E. Haywood-Farmer was born at Comberford Hall, near Tamworth, in 1871, and educated at Oundle School, Northamptonshire. On leaving school he was articled to Mr. J. Mander, architect, of Overstone Park, Northampton. In 1898 Mr. Farmer went to Birmingham and entered Mr. Buckland's office as assistant, and in 1899 joined him in partnership.

We regret that exigencies of space will permit us to illustrate only some of Messrs. Buckland and Haywood-Farmer's most recent work. The older work must be more or less familiar to readers of "The Builders' Journal," and it embraces some charming domestic work round Birmingham.

The Leigh Road Schools are one of the latest built for the Birmingham Education Committee; others for the same authority designed by them are the Secondary and Elementary Schools, Rotton Park, Birmingham (illustrated in "The Builders' Journal" for October 2nd and December 25th, 1907), Elementary Schools, Small Heath, Birmingham (illustrated in the issue for October 2nd, 1907), and the New Road School, Handsworth. Messrs. Buckland and Haywood-Farmer were also architects for the High School for Girls, Barnsley, which work was obtained in competition. This was illustrated in "The Builders' Journal" for January 30th, 1907.

A church at Sutton was the subject of a centre plate in "The Builders' Journal" for July 11th, 1906, and illustrations of alterations and additions to Naseby Hall, Northants, appeared on August 29th, 1906. A number of illustrations of other domestic work at Small Heath, Edgbaston, etc., by the firm have been published in "The Architectural Review" in recent years, and in the Review annual, "Recent English Domestic Architecture" for the years 1908 and 1909. Among the domestic work designed by the firm may be mentioned houses at Knowle, Rugeley (Staffs), Kenilworth, Wigginton, Four Oaks, Moor Green, Bridlington, Linden End, several at Edgbaston, and a house at Witley, Surrey, now in course of erection

The Women's Hostel, Birmingham, was completed some months ago, and occupies a site in close proximity to the new university. The building has been erected as a residence for the women students attending the university.

The illustrations of the village in the Elan Valley, South Wales, show some of the buildings which have recently been erected by the Birmingham Corporation in the Elan Valley, near Rhayader, South Wales, in connection with their water scheme, and provide accommodation for the workpeople engaged upon the work in connection with the construction of the reservoirs and filter beds.

THE WOMEN'S HOSTEL, BIRMINGHAM. BUCKLAND AND HAYWOOD-FARMER, ARCHITECTS.

The buildings are faced with Black Country bricks, with dressings of Hollington Stone. The roofs are covered with Westmorland green Slates.

ART NOTES.

Hues of Three Cities. Rome, Venice, London, that is the descending scale of allurement, but by no means the order of attraction for Mr. Walcot, who, in his third exhibition at the Fine Art Society, still finds something in each that claims him with an intensity that does not show any preference for climate or the romantically inclined. We mean that London traffic and London thoroughfares, their crowds and buildings, so much a part of the life of the metropolis, are as responsive to his medium as the waterways of Venice and her dream-palaces, or the all but vacuous spaciousness of the piazzas of Rome wherein the sparsely scattered groups of people and the drowsy-looking vehicles are reduced to a Lilliputian aspect and seem a vital part of Rome only that this very contrast in the scale of things may be secured.

Without rose-tinted glasses London can give us a harmony of black, white, and grey that does not suffer beside the warmer surfaces of Rome or the delicate tints of a palace on the Grand Canal. Our venerable Portland is the "Lydian-stone" of London, and drawings like those of the Law Courts, St. Paul's, Lombard Street, or the Reform Club must always have first claim on our affections. Mr. Walcot must inspire many to visit Venice and Rome, but he does something much more in persuading us to love London.

In the sketches of Charing Cross, Ludgate Hill, and the Embankment we find all our intimate acquaintance with localities to which we might be indifferent in their familiarity. And the same is expressed in one of the few drawings of Paris included in the present series, showing the old yellow horse-omnibuses starting from the Bourse, one of those earlier notes of an almost forgotten Paris that still survive in the midst of every phase of modernism.

We turn to Venice and find with some surprise that it can in a measure match London's monotones, certainly in a degree not to be attained in Rome. Compare with some of Mr. Walcot's best London work, the Prigione (grim reminder of our vanished Old Bailey), the Library of St. Mark (Nos. 21 and 49), the Nocturne of the same subject, or the exquisite little drawing of "A Gondola," recently exhibited at a meeting of the British School of Rome, in which the interest is drawn to the stonework with its Greek fret base-mould.

Of the Venice of our imagination there are two very Turneresque panoramas, and drawings of the Palazzo Orfe and the Campo St. Angelo that could be placed with Ruskin for colour and the entity given to separate stones. The sketch of La Giudecca is only less vivid than a Sargent.

Rome, however, is responsible for two of the finest things in this fascinating exhibition. One, a study in sienna of Pius VI.'s Sacristy, St. Peter's, a drawing primarily architectural in its qualities, catches the very texture of the stone and the variety of its age-worn surfaces. This is almost a bit of English sandstone—an angle-glimpse in an English cloister, or a piece of the peeling façades of Oxford. Our cathedrals are indeed a series calling for Mr. Walcot's interpretation, and we hope that he may not be deterred, as Ruskin was, from such a project. For though it does seem that long work among the warm-tempered buildings abroad must make one ill-disposed to linger for long in the rarely relieved greyness of our own, still there are days when things are heightened and the sunlight makes us see that England is not so unhappy a place as some would have us believe.

In the second, the entrance of the Scala Regia, the Vatican, you get in a small oblong drawing all the spaciousness and the emptiness of Rome that we hinted at above. Among the several Roman studies that we might select for notice, readers of Hawthorne will find in the impression of the Pincio the haunting mystery of the Marble Faun.

Mr. Walcot shows for the first time some of his architectural compositions and some interesting conceptions of ancient Roman life, and he gives us such diametrically opposed records of contemporary events as the Beatification of Joan of Arc (the scene in St. Peter's, rich with crimson and gold), and a hastily caught impression of the aeroplane that surprised the race-meeting at Sandown last November.

MAX JUDGE.

Art and Its Import. American architects are fully alive to the importance of educating their public. Hence the revision of their tariffs so as to admit on reasonable or easy terms certain kinds of works of art. "Already," says a writer in the "American Architect," "many of the old masterpieces have found their way to America, and undoubtedly many more are destined ultimately to enrich our public and private collections. Relying on present indications, it seems not improbable that American art galleries and museums may yet become noted as the greatest in the richness of their collections of any in the world. The effect which these paintings will have in the art education of the masses is well-nigh incalculable. If it were otherwise, perhaps we could not view with our present equanimity the distress of those nations which are losing their priceless treasures." Even so the walrus wept for the oysters. "'We weep for you,' the walrus said. "'We deeply sympathise.' With sobs and tears he sorted out those of the largest size." But we fear that our American friend, in the largeness and simplicity of his own faith in art, exaggerates the national "distress" so far as this callous country is concerned. Nevertheless, it is because we desire to help on the art movement in this country that we have added the present feature to this journal.

Who's Hoogh ? There has been much ado about the authorship of one of the pictures—"Refusing the Glass"—in the Salting collection. Some claimed it for Pieter de Hoogh, others for Jan Vermeer, yet others for J. Ochtervelt. All these guesses, it seems, were wrong; and, as it turns out, the speculators were pretty much in the position of the young lady who, receiving a letter addressed in an unrecognised handwriting, makes many guesses at the identity of the author, and at length reluctantly breaks the envelope and looks at the signature. The experts, grown tired of guessing, have discovered a signature on the picture. It is "S. v. H.," supposed to be Samuel van Hoogstraten, who was born in Dort in 1627, and died in 1678. He certainly painted in the same manner as De Hoogh.

R.B.A. Exhibition. At the one-hundred-and thirty-third exhibition of the Royal Society of British Artists, the 338 pictures on view show a large preponderance of landscapes and portraits, the former testifying to the strength of the influence of Constable (via France), the latter to that of Mr. Sargent. *Genre* subjects seem to be quite out of fashion, and the reaction against Turner seems to be complete.

The Rise of Hals. Mr. Otto Kahn, banker, has given in New York 500,000 dols., or about £100,000, for a portrait group by Frans Hals, comprising five whole-length portraits in a landscape. The canvas measures 79ins. by 112ins. The picture has been exhibited as representing the painter and his family, but the identity is questioned. The man and the woman in the group are perhaps the same couple as the two figures in a picture in the Rijks Museum, Amsterdam, which were formerly, but are now no longer, supposed to be portraits of Hals and his wife, and it follows that the portraits in the Kahn

picture are of dubious identity; and it is by no means certain that any indubitable portrait of Hals is in existence, the authenticity of the one or two accepted portraits being open to question. The rise in prices of pictures by Hals is very remarkable. The first Hals to reach four figures in this country was a portrait at the De Zoete sale in 1885, which fetched £1,008. In 1902, at the Cholmeley sale, Messrs. Agnew paid 3,600 guineas for a small portrait; in 1908 the National Gallery gave £25,000 for a group and now Mr. Kahn has given what is stated to be "a record price for a single picture."

Art in Epigram. A case, the second of its kind, having been reported from Bristol of a policeman who paints when off duty, and has exhibited pictures, "Punch" devotes a poem to the subject. We venture to quote the first and best verse:—

"Ever we knew them firm but kind.
Keen, when a row arose, to whelm it,
But not till lately looked to find
The artist underneath the helmet;
But now the facts are guaranteed,
The coat of blue, the buttons argent,
May hide a CONSTABLE—indeed,
A veritable SARGENT."

Probably the difficulty of rhyming the name precluded a much-desired reference to Whistler.

Mr. St. John Hope. The resignation by Mr. W. H. St John Hope of the assistant-secretaryship of the Society of Antiquaries has been accepted by the council of the society with a regret that will be widely shared. For five-and-twenty years Mr. Hope has been closely associated with some of the most notable achievements in archæological research, and particularly with the important discoveries at Fountain Abbey and Easby, Castleacre Priory, Furness Abbey, St. Radigund's and Langdon Abbeys, Ludlow Castle, and above all at Silchester, where he helped to initiate, in 1890, the remarkable excavations which from then till now have yielded such rich contributions to our knowledge of Roman dwellings. Mr. Hope has published several books, the first of which is an architectural history of Rochester Cathedral; and it is understood that he is now completing, by command of the King, a very thorough history of Windsor Castle.

Whence Came Byzantine? M. Charles Diehl, whose paper on Byzantine art contributed to last year's Archæological Congress at Cairo has just been published, lays stress on the debt to ancient Egypt, whence Byzantine art derived, for instance, its characteristic architecture, and the high technical skill shown in its sculpture. The "Athenæum" adds the comment that "the more facts come to light, the stronger does the obligation of the modern world to ancient Egypt appear."

OBITER DICTA.

Merciful. A work of art must be estimated by the degree of its merit, and not by the extent of its defects. —*Times.*

Generous Loan. The Law and Finance Committee of the Greenock Corporation agreed [with reference to the housing requirements of the Government workers who are being sent from Woolwich to the Clyde Torpedo Factory] that should the Admiralty proceed with any scheme of housing, the Corporation would lend *their moral support.*—*Glasgow Evening Citizen.* [The italics are ours; the generosity is purely Glaswegian.]

Venerable Wood. It would be a matter for serious regret if the development of fireproof construction in domestic architecture were ever to lead to the abandonment of woodwork as a decorative feature of the house. The use of wood, both for structural and ornamental purposes, has the sanction of an antiquity too remote to be estimated, for it dates back to those periods of human history when the shelter of a cave or of a tent of skins was first exchanged for that of a hut built of logs and thatched with leaves. In times comparatively recent—though even these are historically remote enough—wood construction became so elaborate and so artistically complete that it was able to impose its characteristics upon the style of the stone buildings which were erected by highly civilized nations. The Egyptians, the Greeks, the Romans, and many of the Eastern races, simply translated into stone the structural forms to which they had become accustomed in the woodwork that had been handed down to them from previous generations.—*Art Journal for April.*

Ugly Houses. Surely if those landlords who have great empty houses to let would convert them into flats they would receive more in the aggregate; and then, when the lease falls in, as many of them are to do shortly, let us pull down the ugly things and build small houses in their place. . . The serious aspect to the neglect of the housing of the middle classes is that thousands are driven out of London in despair, to seek their dwelling elsewhere.—*Peter Pepys in "The Throne."*

Defect of Modern Stained Glass. "The great danger at the present time, however, seems to me to be the over-elaboration of variety in colour and texture, the striving by the glassmaker continually to produce new effects to tickle the fancy of the artist. I think myself you have too many facilities at your disposal, and that the great fault of the modern stained glass window is the temptation to lack simplicity and harmony of colouring. In the thirteenth century you rarely find more than five colours of glass used in a window. I do not say this was anything more than making a virtue of a necessity on the artists' part, because that was about all the range they were capable of producing. But the effects obtained by balancing these few colours one against the other seem to me to be some of the most beautiful the world has ever seen. I have seen modern windows in which scarcely two pieces of glass in the whole window were of the same nature. The result may be extremely pictorial, but it misses some of the finest qualities of stained glass."—*Mr. Noel Heaton on "The Foundations of Stained Glass Work."*

BRUNELLESCHI AND THE RENAISSANCE.

By PROFESSOR BERESFORD PITE, F.R.I.B.A.

[*This is a short abstract from a long and interesting paper read before the Architectural Association. A considerable portion of the paper consisted of historical references, extracts from contemporary documents, biographies and critical studies of the Italian Renaissance which helped admirably towards an understanding of the times and events which influenced Brunelleschi and his contemporary artists. Exigencies of space compel us however to confine our summary to the more important events and works of this great master as set forth in Professor Pite's paper.*]

The period covered by the life of Filippo di Ser Brunelleschi, who was born at Florence in 1377, and died in 1446, seems to claim especially, as do so many similar epochs of a life-span, a pre-eminence in artistic and historic importance.

The Dawn of Renaissance.

Symonds describes better than anyone else the intellectual movement and spirit of the era of Brunelleschi, the Cinquecento literally beginning when, as we have seen, he would be twenty-three years of age, so that his prime came with the full tide of that most delightful and wonderful phase of early Renaissance art which included his rival Ghiberti, 1378-1455, and his attached intimates, Donatello, the incomparable sculptor, 1386-1466, and Luca della Robbia, whose delicious art and technical achievement so fascinates ourselves. To this group we have only to add the names of three contemporary painters to indicate the marvellous galaxy of Florentine artistic power: Fra Angelico, 1387-1455; Masaccio, 1400-1433; and Filippo Lippi, 1400-1469. Symonds says: "Speaking roughly, the half century between 1450-1500 may be termed the culminating point of the Renaissance,"

Character of Brunelleschi.

It would not be difficult to find material for an architectural biography of unusual interest to modern professional men in the career of Filippo Brunelleschi—competitions, committees, strikes, rivalries, the employment of models, and tactical manœuvres of various kinds would be provided such as insure a sympathetic ear; while force of personal character, versatility in sculpture and mechanics, and many points of contact with other branches of art and science would almost fill up the ideal and make Brunelleschi's story the true modern exemplar of an architectural student.

Vasari, who wrote in 1550, about 100 years after his death, declares that "he was of such exalted genius that we may truly declare him to have been given us by Heaven for the purpose of imparting a new spirit to architecture, which for hundreds of years had been lost."

The stormy rivalries of Florence during his lifetime point to the existence of strong appreciation of his talent, and we find that Cosimo de' Medici introduced him to Pope Eugenius IV. by an autograph testimonial, which runs as follows:—"I send your Holiness a man of such immense capacity that he would have confidence enough to turn the world back on its axis."

Mons. Müntz (quoted in Blashfield and Hopkins's edition of Vasari) "calls Brunelleschi the Christopher Columbus of modern architecture, and asserts that he created it as a complete entity.

The Renaissance.

William J. Anderson writes, in the introduction to "The Architecture of the Reniassance in Italy," that that movement "has been claimed as a result of the influence of literature and the study of the ancient manuscripts; but literature, while bolstering its decline and fall, had scarcely more influence on its origin than the writings of Virgil, Horace, Livy, and Ovid had on the architecture of the Augustan age they adorned. Originality has never been displayed to greater degree than by the architects of the Early Italian Renaissance, and the interiors of San Lorenzo, the Badia at Fiesole, and Santo Spirito—all churches of Brunelleschi—are real works of genius. Brunelleschi, seeing the confusion and incoherency of the work of his time, went farther afield for his architectural technique to find it in the ancient principles of building, laying the foundation of a great revival by his masterly use of them, while fully satisfying immediate requirements. In Brunelleschi's resolution to acquire the Roman principles and to build upon them, we have just a distinctive circumstance unprecedented in the world's history, it may be, but in its audacity quite characteristic of the deeds of the time.

To this, the view of a modern architect, we will add the testimony of Leon Battista Alberti, a young contemporary of Filippo Brunelleschi. The passage is taken from the dedication to Brunelleschi of his (Alberti's) treatise on painting:—

"Who is so unfeeling or so envious that he would not praise Filippo (i.e., Brunelleschi), the architect, beholding here a structure so grand, lifted to the heavens, ample to cover with its shadow the whole Tuscan people,

Photo: Cyril Ellis.

VILLAGE IN THE ELAN VALLEY, SOUTH WALES: A COTTAGE. BUCKLAND AND HAYWOOD-FARMER, ARCHITECTS.

erected without aid of framework or multitude of timbers—a work of art, in truth, if I judge rightly, such as, deemed incredible in these days of ours, was neither conceived nor known by the ancients?"

His Individualism.

Individualism came to architecture with Brunelleschi, remained to us until Mr. Street, and is not apparently yet replaced by co-operative design and workmanship. The works of Brunelleschi may be divided into two fairly distinct groups, and it may appear simple to do so, appraising the value of either to the Renaissance movement as follows:—(1) The completion of the mediæval cathedral of Florence by the addition of an octagonal-pointed vault involving architectural and mechanical problems of great importance; and (2) the revival and employment of architectural features, derived from classical studies, of great refinement and beauty, forming the first clearly defined phase of a new Italian style, and of great subsequent influence and permanent artistic value.

The first, a special problem completing a mediæval conception in a practical manner, came to its termination, and the second, the origination of a method of architecture with new detail and proportions, developed until it obtained a practically complete hold of the architecture of all civilised peoples.

Brunelleschi was an enthusiast for this classic spirit also; he loved it, mastered it, employed it, tentatively in the Pazzi Chapel, and, as a revelation of new and wondrous gracefulness in the churches of San Spirito and San Lorenzo, while the Badia at Fiesole and the Loggia of the Innocenti Hospital show that he knew how to employ these artistic materials naturally in expressive construction. The development of a charming architecture, connecting and enshrining the swift movements of sculpture and decorative painting until the time of Michelangelo a century later, is due to his initiative and school.

Santa Maria di Fiore.

The problem of the completion of the Church of St. Mary of the Flower, that is, of The Lily, alike the Flower of Florence, and hence her name, and of Mary, was urgent just at that period in the early manhood of Brunelleschi, when, as with you, apparently insoluble enigmas exercise perhaps their greatest fascination over the mind. The new cathedral replaced the old historic Church of the Santa Reparata, which resembled the beautiful San Miniato, the citizens in 1294 having determined upon its rebuilding.

Arnolfo di Cambio was at this time Architect to the Republic, and to him Florence owes the bulk of her XIVth century monuments. Until his death in 1310 the works had continued in spite of much disturbance of civic peace by calamitous wars, seditions, and fire; the exile of Dante coming within this period.

The diminished revenues of the Commonwealth caused the suspension of works until 1331, and in 1334 Giotto, the painter, was appointed chief master of the work of the cathedral, and overseer of the other constructions of the Republic. He quickly begun the design and erection of the Campanile, but died in two and a half years' time, when the tower was only about one-third of its height.

Taddeo Gaddi, his godson, having worked with Giotto for twenty-four years, was one of those to whom was intrusted the oversight of the works on the Campanile; this Gaddi is the celebrated painter, but he also was the architect of Ponte Vecchio, with its charming street.

Brunelleschi's Chef d'œuvre.

It will be impossible, however, to appreciate Brunelleschi's task unless it is borne in mind that the progressive development of mediæval cathedral building is regulated and marked by the construction of vaulting. The fact that it was necessary to vault the nave occasioned the whole series of factors of aisles and buttresses, and conditioned the plan of transepts and eastern extension. The use of the pointed arch had enabled vaulting chambers of all shapes and sizes to be constructed with facility in diverse materials by the employment of ribs which gradually assumed to themselves nearly all the constructive qualities. This rib principle left the spaces between without strains or stresses, so that they were filled in with the lightest material, or even left in an open veil of tracery, as in Henry VIIth's chapel. In Italy the use of brickwork for vaulting enabled the fillings to be extended, but it never became the practice there, as here, to multiply the strengthening ribs for the sake either of stiffening the vault or for æsthetic reasons. The earlier and later mediæval vaults of Italy, alike, were quadripartite in system, and, as at Florence, of the greatest size, the nave having a width of 55ft. and consisting of only four immense square bays. The nave of Westminster

Photo: Mansell.

THE PAZZI CHAPEL, CLOISTER OF SANTE CROCE, FLORENCE. FILIPPO DI SER BRUNELLESCHI, ARCHITECT.
This work exhibits with fullness the charm of Brunelleschi's power as a draughtsman and designer: the elegance, refinement, and originality of the whole are wonderfully fascinating and characteristic. The vigour of the vaulted atrium, with its delicately moulded attic storey and beauteous frieze, the delicacy of the doorway, and the grace of the relief and the treatment, make this work a "gem of the Renaissance."

Photo : Mansell.

THE DOME OF THE CATHEDRAL, FLORENCE. FILIPPO DI SER BRUNELLESCHI, ARCHITECT.

This, one of the most famous Domes of the world, spans the immense octagon crossing (135 feet across) of the Cathedral at Florence, and is peculiar in rising from an octagon, preserving the eight sides of the latter. The construction is of stone groin ribs with brick filling. Brunelleschi introduced a great bond of timber, bound with iron ties, at the base.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

Abbey having a clear width of 35ft., employs twelve bays in a similar length of 240ft.

The principle of both is, however, the same; the rectangular chambers of the vault at Florence are spanned by pointed arches, having stone ribs at the intersections and brick cells between.

Principles of the Dome.

The boldness with which the principle of stone groin-ribs with brick filling had been employed in the vast span of the nave seems to have convinced the builders that no greater difficulty would attend the vaulting of the octagon. It may be remarked here that the use of tie-rods to the vaulting and arcades of the nave is an economy designed to dispense with flying and other buttresses, and that where the octagon was placed, and masses of wall occur which provide abutment for the great arches, neither protruding buttresses nor tie-rods are employed.

The enormous scale of the octagon, 135ft. across, with the choir stalls grouped in the centre, was to provide the city with the grandest temple then in Western Christendom, and if the cupola shown in the fresco of the Spanish chapel only supposed upon the basis of Talenti's octagon, but little diminution of its external glory and none of its internal beauty or usefulness would have been sacrificed.

The greater work, begun in 1357, was pushed on, and ten years later the four bays of the nave were nearly completed. Many consultations with the Board of Works ensued, and difficulties soon became apparent. In 1368 work was begun on the eastern apse, and in 1369 Talenti was succeeded by his son, municipal funds being required for other objects, among them the erection of the Loggia del Lanzi from Orcagna's design. It is not till 1382 that activity at the Cathedral is again evident, for in 1383 the building of the chapels to the choir was commenced and commissions were given for sculpture. In 1407, after nearly forty years, the eastern tribune, with its five chapels, was completed, and at the threshold of the Cinquecento the construction of the octagonal vault could no longer be deferred.

The Baptistery Gates, Florence.

The competition of sculptors inaugurated in 1401 for completing the series of bronze doors to the baptistery, marks an epoch in the development of the arts of sculpture and bronze-founding. The competitors were selected, and young men are found among the six; Filippo Brunelleschi was but twenty-four, and Lorenzo Ghiberti, whose panel was accepted, was twenty. It is stated by a biographer of Brunelleschi that the commission of assessors proposed to divide the commission, and he gives Brunelleschi the credit of declining the work under the circumstances; but in any case the work was given to Ghiberti towards the end of 1403.

Brunelleschi and Rome.

Vasari's story of Brunelleschi's journey to Rome accompanied by his attached friend, and junior by nine years, Donatello, seems to require further proof, as Professor Norton notes that Donatello appears as assistant to Ghiberti both in his first and in a further agreement for the execution of the gates. It is clear, however, that Brunelleschi, who was of good family, sold some property, and with the proceeds paid the expenses of his visit to Rome, the first of many—and it appears that he worked at his handicraft as a goldsmith, and exercised his mechanical genius at making clocks, maintaining himself thus, but not without visits home again from time to time. The condition of Rome after practically a millennium of decadence cannot easily be realised. The great city had been for centuries in a repellent condition of decaying splendour. The Imperial monuments had not yet attained the credit and charm of picturesque ruin under which Piranesi knew them, and were nothing more than the dilapidated symbols of a departed glory. The fame of pagan and persecuting Rome was still obnoxious in its monuments, and the scenes of martyrdom had not yet become sanctified by artistic as well as religious tradition.

It is not difficult for us to realise what Rome could reveal to such an intelligent artist, just breathing emancipation from tradition, and conscious that Ghiberti had struck a freer and fresher note in sculpture than any before. The strong genius of his young admirer and follower, Donatello, tended in the same direction, and we are told pretty stories of how Donatello "had eyes only for sculpture"—the great antiques were not then unearthed—while Brunelleschi devoted himself to the monuments.

Brunelleschi appears to have been again in Florence three years after the competition for the Bronze Gates in 1404, as he matriculated as a goldsmith on July 2nd in that year; the celebrated guild including modellers, workers in metal, and painters.

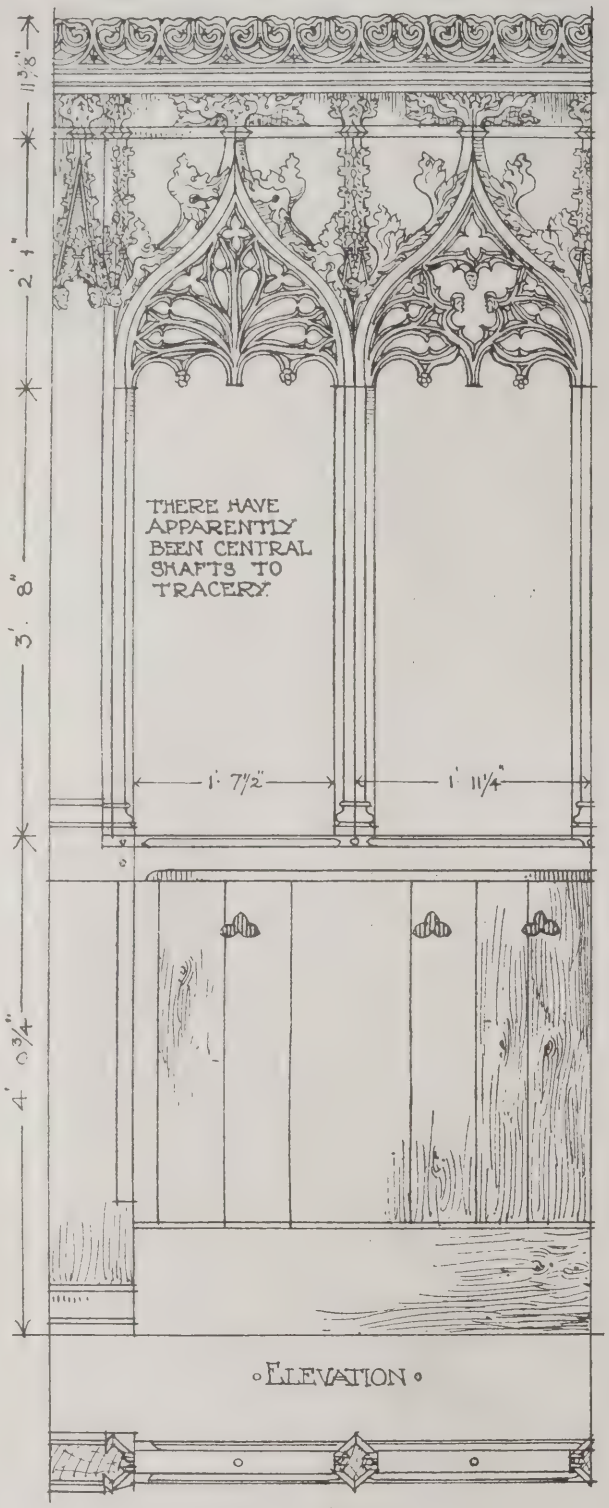
It is probable that Brunelleschi spent the ensuing years until he was forty, at Rome, a reputation for knowledge of architecture, however, accruing to him at home during the period of his absence from Florence. He must not be regarded as a disappointed sculptor, who exiled himself from his own field of executive art through jealousy of an accomplished rival, but as having discovered a new source of inspiration and study in that combination of mechanics, geometry, and art, afforded by the buildings of Ancient Rome from which he could not tear himself away. We do not find him again in Florence until 1417.

The Building of the Dome.

It is not easy to understand how the octagon stage can have been reached without the adoption of some well-defined scheme for the vaulting, as the elevation above the abutting walls removed it beyond the possibility of employing them as buttresses. The provision of this drum storey lifted the cupola vault from the category of Gothic vaults, and at once placed it among the long-forgotten and forsaken series of domes originating with the Pantheon at Rome, and developing in the later epoch of Byzantine architecture. A dome poised upon a drum has to provide for its own thrusts, which should be reduced to a minimum by horizontal arcuate construction, and can then be counterpoised by weight placed vertically upon the haunch as in the *gradene* of the Pantheon. The Gothic pointed vault, however, could not exist even momentarily without the ample lateral abutment of flying buttresses or massive walling; and it has already been pointed out how iron tie rods provided for this in the vaulting of the nave. I must confess to the strongest suspicion, though there does not appear to be direct evidence to support it, that the elevation of the cupola is due to Brunelleschi's advice, and that his observations at the Pantheon convinced him that what had been done by the ancient Romans was not beyond his powers. It is certainly highly probable that this height would not have been erected without reliance upon some guide or scheme for dealing with the thrusts of the vault. In any case, embarrassment attended upon the Board; the Guild of Master-masons seem to have exhausted their traditions, and the actual need for an impossibly big centring upon which to build the vault, after the manner of the baptistery, though so much larger, brought the works to a standstill.

An anonymous contemporary of Brunelleschi's, whose work is the probable basis of Vasari's as well as of other biographers, tells us, "But if the master builders had seen difficulties, Philip showed them far more. And someone asking, Is there, then, no mode of erecting it? Philip, who was ingenious also in discourse, replied that if the thing was really impossible, it could not be done; but that if it were not so, there ought to be someone in the world who could do the work." The recorded payment of ten florins was not probably made only for this philosophic stimulant, but for advice and work in connection with the whole drum storey and its eight suspiciously Roman eyes.

Between this year (1417) and 1420, when Brunelleschi, Ghiberti, and Battista d'Antonio, master mason, were jointly appointed to build the cupola at a salary of three florins a month each, there was much evident controversy, and there is in the anonymous biography and in Vasari much picturesque description of indecision on the part of the committee, rivalry on the part of the "profession," and strategetical manœuvres between Rome and Florence by Brunelleschi. Amidst it all, the fact ultimately emerged that the professed sculptor-goldsmith, but amateur builder, had science and skill enough to make him confident of his ability to design scaffolds and construct a vault upon the huge octagon, 135ft. across, that would stand without either abutment or crossties. The three years' discussion and disputation amounted to a conviction that the little, clear-headed man of forty-three could do it, and his mystifications and secretiveness, his sudden absences, and vigorous assertiveness were the means by which this conviction was produced.



The joint appointment of the popular artist Ghiberti, with his strong local interests (Florence had become enthusiastic over his bronze doors), and of the recognised professional man Battista, seems, under the circumstances, reasonable, though the difficulties of joint control were little compared with those of joint reputation which were ultimately involved. This latter point was everything to such a character as Brunelleschi's, and led to the squabbles with Ghiberti, and to the ultimate demonstration that Brunelleschi could and would carry the works to successful completion alone.

Competition for the Dome.

A competition was inaugurated on Aug. 19, 1418, for the designs for the cupola, and a premium of 200 florins offered, the time extending to December 12. In the next year Brunelleschi and Ghiberti were each commissioned to make models on a large scale, and Brunelleschi employed Donatello to assist him with Nanni di Banchi. A brick model was made, based on his Roman studies, exhibiting the apparently impossible feat of how to build a dome without centring, an achievement derived from the Pantheon, and embodying the fundamental difference between a dome erected in horizontal rings or series, each complete and supported on its predecessor, and the mediæval groined rib to which, from the springing, a wooden centring piece was necessary.

DETAIL OF SCREEN BETWEEN NAVE AND CHANCEL LAVENHAM PARISH CHURCH SUFFOLK
MEASURED AND DRAWN BY J. L. BERRY.

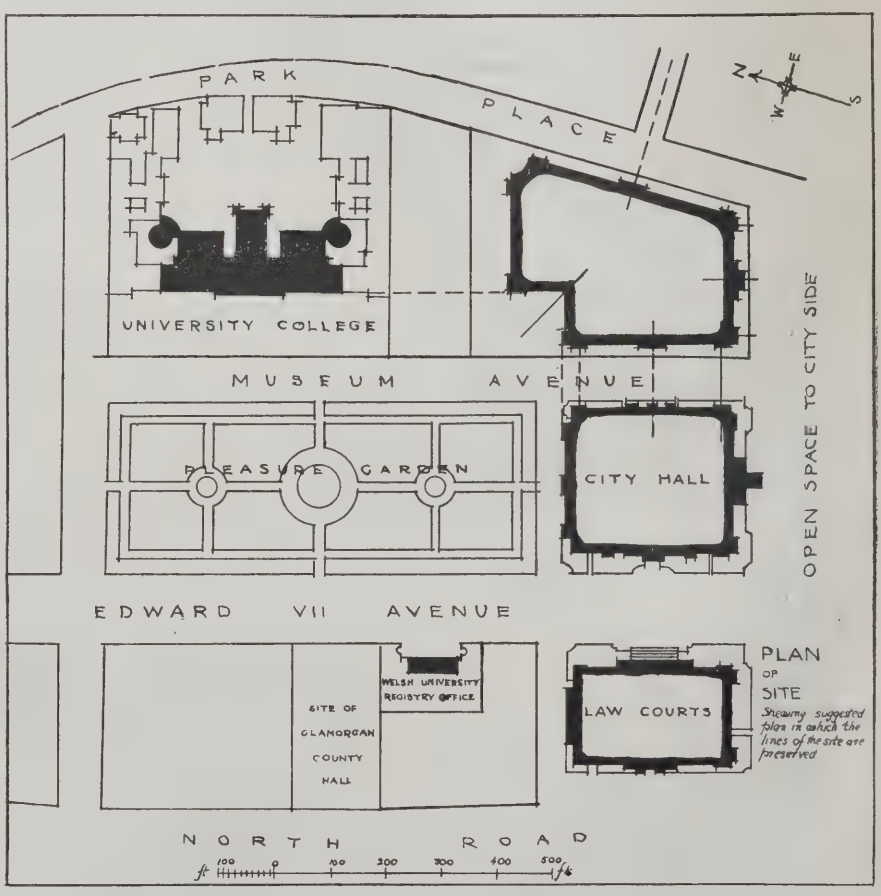
The request for back numbers of "Details," all rights in which publication have been acquired by the Proprietors of "The Architects' and Builders Journal," have been so numerous that it has been decided to republish selected plates in this paper. The screen here illustrated is one of the finest of the "Decorated" period. It is of oak, the top beam being in one piece, with mouldings and crockets carved out of the solid. The cresting, apparently, has been restored. Originally there were slender shafts to the tracery, the work of the iconoclast who sawed them off is greatly to be regretted.

DETAIL OF SCREEN BETWEEN NAVE AND CHANCEL, LAVENHAM PARISH CHURCH, SUFFOLK.

THE WELSH NATIONAL MUSEUM COMPETITION.

[This is the most important Competition that has been held since that for the London County Hall, the total estimated cost being about £250,000. The new building will be situated in Cathays Park, Cardiff, and will form part of the group of important new public buildings recently erected there, which include the City Hall, the Law Courts, the University College and University Registry Building, and the Glamorgan County Hall. The assessors were Sir Aston Webb, R.A., Mr. J. J. Burnet, A.R.S.A., and Mr. Edwin T. Hall, F.R.I.B.A., and their choice fell on the design of Messrs. Smith and Brewer of London. Premiums of £200, £150, and £100 were awarded to the designs of Mr. T. L. Vesper, Mr. Henry T. Hare, and Messrs. Milne and Hepburn, respectively. One hundred and thirty-seven firms entered for the competition. A review of the drawings, by our special Commissioner, follows.]

The conditions of the competition are sufficiently well known to architects in general to require no detailed description, but a recapitulation of the chief points may be desirable.



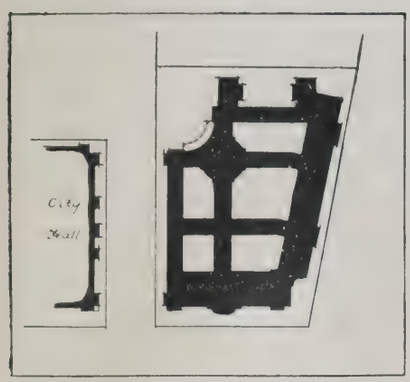
The total cost of the building was not to exceed £250,000, though this sum was not to be considered as including sculpture. Six exhibition galleries for the departments of antiquities and history, geology, botany, zoology, industries, etc., etc., were to be provided, varying in size from 3,000 sq. ft. to 12,000 sq. ft. Round these were to be disposed smaller rooms or alcoves. In addition to the accommodation required for research students and reserve collections, an aquarium and children's museum had also to be provided. Under the head of administration and work rooms were to be included a library capable of containing 20,000 volumes, a restaurant of about 2,500 sq. ft. in area, and a lecture theatre large enough to accommodate at least 500 people. No provision for residential quarters was required. About one-third of the proposed work, including the south block, capable of temporarily housing all the six departments of the museum, in accordance with the requirements of the conditions, is to be erected in the first instance.

The drawings submitted by each competitor were insured by the Council of the National Museum of Wales against fire to the value of the second premium—£200. With the exception of the perspective, all elevational drawings submitted were to be executed only in pen and ink, without shading or colour of any kind, except the inevitable flat tint of Indian ink on the door and window openings and on the roof. We cannot understand this rooted objection to drawings rendered in the French and American manner. For our part we are of the opinion that the surface-modelling of a design can only be properly appreciated when the relative depths of projections are made apparent by corresponding shadow values. We do not see any reason why competent assessors need feel distrustful of such a method of expression.

Some description of the disposition of the existing buildings adjacent to the site is necessary to a proper comprehension of the nature of the problem. From the accompanying sketch-plan it will be observed that the site itself is on the east side of Messrs. Lanchester and Rickards's City Hall, and in a balancing position to their Law Courts, and that the axis of the large rectangular "Pleasure Garden" is coincident with that of the City Hall. Next to the vacant site on the north side and facing the garden is Mr. Caröe's University College, only the central part of which has been erected as yet.

It was required in the conditions that the new Museum (the elevations of which were to be of Portland stone) should be in sympathy with the general scheme adopted. At the same time it was made clear that this was not to be taken as involving an actual reproduction of the design of any of the existing buildings.

From this we should have thought it sufficiently obvious that the clause had a broader significance than that apparently understood by the authors of the premiated scheme. It seems to us a first essential in any scheme claiming architectural merit that satisfactory contour should be preserved both on the garden side and on the part to Park Place, the latter being an important residential boulevard with clearly defined lines. We mean, in fact, that the Park Place façade should follow the line of the road, as is practically suggested in the proposed extensions to University College; and, in the case of the elevations to the garden, the lines of the façades of the Law Courts and City Hall, and of University College should have been maintained and the shape of the main space thus preserved. The problem was one of extreme difficulty, and on that account no doubt was ignored by almost every competitor. In practically every case the narrowest meaning was read into the clause already mentioned, and a design evolved regardless of larger considerations.



PLAN OF SITE
Showing suggested plan in which the lines of the site are preserved

Selected Design.

Messrs. Smith and Brewer's plan is remarkable for its economy, a saving of at least £10,000 on the sum available (£250,000) being effected. But the feature in their scheme which probably decided the assessors' choice is the fashion in which the reserve collections are placed back-to-back to the general exhibition galleries, completely enclosing them on three sides of the site, and so disposed as to be conveniently accessible from them. The general exhibition galleries themselves are lighted from the large interior court, in the middle of which are the central galleries. The reserve collections are lighted from the main façades. Messrs. Smith and Brewer appear to have thought it worth while to secure a double set of reserve galleries by the introduction of a ground-floor mezzanine, which results in the division of the windows of the main façades by the thickness of a floor, though we ourselves should scarcely have thought the consequent disfigurement justified the saving of expense.

The practical destruction of the architectural value of the chief axis of the plan, by a series of unfortunate contractions, is to some extent compensated for by the ingenious manner in which the small alcoves required in the conditions are grouped round the central galleries. The lines of cross-communication are also well maintained, and there are distinct possibilities in the introduction of the garden court, with its well, beneath which the aquarium is placed.

In the conditions emphasis was laid on the desirability of placing the administration rooms in a central position, and in such a fashion that whilst not being subject to annoyance from the general public they should yet be readily accessible to officials from all departments. Messrs. Smith and Brewer have placed them over the main

BLOCK PLAN. DESIGN SUBMITTED BY REILLY, WOOD, AND BURROUGHS.

entrance. The relegating of lavatory accommodation to the basement will not, we imagine, conduce to convenience either, and if the basement itself is to be dependent for light on the basement windows, which, shown in elevation to 1-16in. scale, have the appearance of rather meagre pigeon-holes, undesirable confusion may possibly arise.

A particularly unhappy treatment of the façade to Park Place is achieved by the addition of a semicircular feature in the form of a lecture theatre on the ground floor, which effectually destroys all continuity of effect. Practically the idea is admirable enough and provides the required direct access from the street.

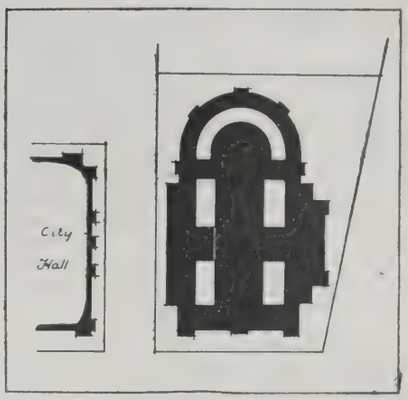
With regard to the elevations in general, we take it that in the case of the south front, the end blocks in the former's design are intended to echo the masses occupying a similar position in Messrs. Lanchester and Rickards's Law Courts. But Messrs. Lanchester and Rickards strengthen their surface modelling in precisely those places where the authors of the selected design have thought fit to leave it most unconvincing. The scale, superficially maintained in the main lines of the flanking blocks, is altogether ignored in their minor composition. And the introduction of the central feature deprives the whole arrangement of significance

Second Premiated Design.

In the scheme submitted by Mr. T. L. Vesper the general arrangement along the chief axis is, in some degree, reminiscent of that adopted by the authors of the selected design. The lines of cross-communication are equally good, whilst the disposition of the stairs is considerably better. The plan, however, though simple and direct as a whole from the utilitarian point of view, is marred by certain failings in practical details and by non-compliance with the requirements of the conditions in several respects.

The main-service lift on the ground floor is inconveniently placed, and the lecture theatre, specially required to be directly accessible from the street, is centrally placed on the first floor. Another defect is the position of the library. From the conditions we would presume that the latter would be almost solely for the use of students consulting the director, and for that reason it would require to be placed in close proximity to the director's room. Actually, it occupies a position on the first floor over the main entrance and quite removed from the director's apartments, which are situated in a distant corner on the ground floor.

Mr. Vesper's elevations are composed in a manner with which we cannot pretend sympathy. In our opinion they ignore the essential principles of massing. For example, on the south façade where two end blocks form the flanking pieces to a central feature, we should have thought only three solutions could offer themselves. Taking it that the end blocks are necessary to echo the arrangement of the Law Courts, either the connecting piece between them should be treated as one continuous face, or else broken by a broad mass of less projection and height than the end blocks, or else the centre should be marked by a strongly designed one-storey projection. Mr. Vesper has preferred a narrow interruption. The elevation to Museum Avenue has rather more features than good composition requires, and a closer inspection of the detail reveals what we ourselves regard as but an inferior handling of motives.



Third Premiated Design.

The scheme gaining the third premium of £150, the work of Mr. Henry T. Hare, is marked by simplicity and directness, but lacks any architectural conception in the relative arrangements of the rooms. It seems to have been thought out rather as an exercise in economical building than as an artistic problem.

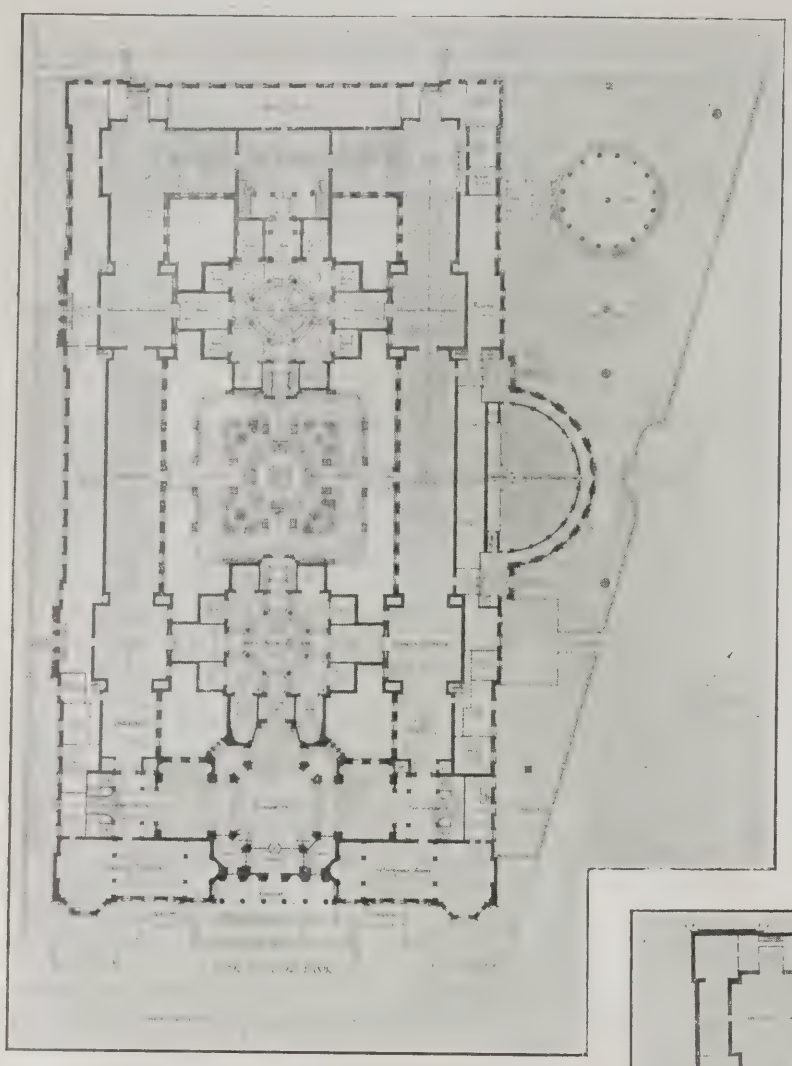
The treatment of the elevations is rather at variance with that of the adjacent front of the City Hall, whilst the detail lacks correctness.

Fourth Premiated Design.

Messrs. Milne and Hepburn, the authors of the 4th premiated design, are to be congratulated on taking into consideration the axis of the City Hall façade to Museum

BLOCK PLAN, DESIGN SUBMITTED BY LANCHESTER AND RICKARDS.

Avenue and on preserving the lines of the garden square. But we could have wished that a similar care had been displayed in the front to Park Place, which is broken in a fashion calculated to give the plan an awkward and botched appearance.



Other Designs.

Messrs. Lanchester and Rickards submit two schemes modelled on the same lines, both of which, for some unaccountable reason, fail to take into consideration the necessity of preserving the shape of the garden square. Nevertheless, we have no hesitation in pronouncing Messrs. Lanchester and Rickard's design—regarded from the point of view of plan—by far the finest conception submitted. The spacious central hall dominates a masterly arrangement of beautifully-shaped parts disposed in perfect architectural relation to each other, and the whole is worked out with due regard to actual requirements. The treatment of the façades, as might be expected, harmonises with those of the Law Courts and City Hall. The elevations themselves are most vigorously drawn. The detail is difficult.

Messrs. Reilly, Wood and Burroughs are the authors of a design in which the shape of the plan is determined by the architectural requirements of the site, considered in relation to the other buildings, the main lines of the square and the line of the Park Place boulevard. The dominating mass—a lofty feature of great strength—is placed at the diagonal axis of the Pleasure Garden, and the grouping of the features subsidiary to it is finely managed. Unfortunately, the plan lacks compactness in certain minor parts, and is not always thoroughly resolved. The detail through-

THE WELSH NATIONAL MUSEUM COMPETITION: SELECTED DESIGN. SMITH AND BREWER, ARCHITECTS.

WELSH NATIONAL MUSEUM: SELECTED DESIGN. SMITH AND BREWER, ARCHITECTS.

out is distinguished by that facility and scholarship which we have come to consider so extraordinary in this country. The perspective illustrating one of the pavilions of the south front is most accurately drawn and beautifully rendered

We shall devote further consideration to the designs submitted after their prospective exhibition in London. Next week we shall publish reproductions of the other premiated designs which considerable pressure on our space has prevented us from illustrating in this issue.

NOTES ON COMPETITIONS.

LIST OF COMPETITIONS OPEN.

APRIL 9. ELEMENTARY SCHOOL, BLOXWICH. Particulars given in our issue of March 16th. No further conditions will be issued.

APRIL 23. COUNTY OFFICES, NAVAN. Particulars given in our issue of March 16th.

MAY 31. MUNICIPAL OFFICES, KARACHI. Particulars given in our issue of March 16th.

JUNE 11. COVENTRY. ENLARGEMENT OF SCHOOL at STOKE. Limited to Architects practising in Coventry. Particulars given in our issue of March 16th.

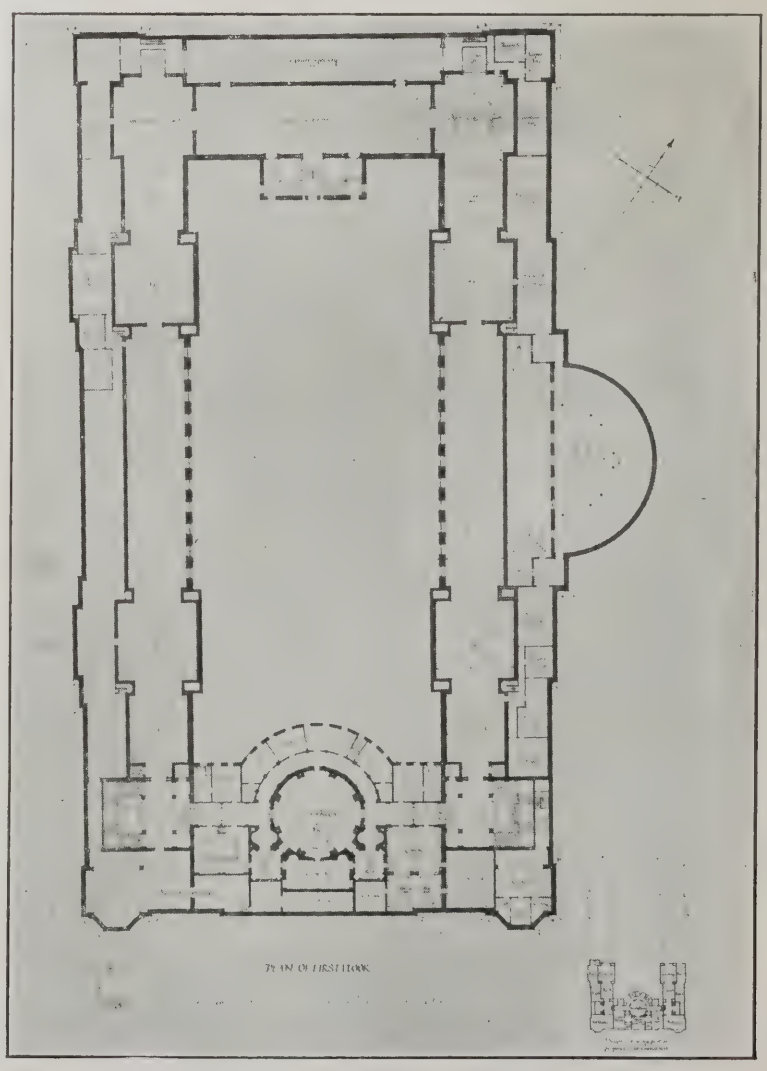
JUNE 15. ELEMENTARY SCHOOLS, ACTON. Particulars given in our issue of March 16th.

AUGUST 31. COVENTRY. NEW ELEMENTARY SCHOOL in Centaur Road. Limited to Architects practising in Coventry. Particulars given in our issue of March 16th.

NO DATE. BIRKENHEAD CHILDREN'S RECEIVING HOME, at the Union. The Guardians invite architects residing within the limits of the Birkenhead Union to submit designs for a proposed Receiving Home for Children in Birkenhead. Premiums are offered to those three architects whose plans are selected. Conditions and instructions may be obtained from John Carter, Clerk to the Guardians, Poor Law Offices, Birkenhead, on application by letter only.

CORRESPONDENCE.

[The Editor declines responsibility for the statements made or opinions expressed by correspondents.]



Prime Costs and Provisional Sums.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—In "R.C.'s" letter in your issue of March 23rd, the writer is evidently suffering from a grievance common to contractors generally, which is entirely their own fault. In my experience, where prime costs are included in quantities, the contractor is at liberty to price the item out, adding such profit for himself as he thinks fit. In the case of provisional sums, I have never yet seen a case where no builders' profit is included. The amounts are usually stated either as including 5 per cent. profit to builder, or else the builder is asked to add his commission at the end of the Provisions Bill.

As long as builders, in their anxiety to keep as low as possible, choose to ignore a reasonable profit on these items for themselves, they are bound to suffer.

Manchester. "A.B.C."

WELSH NATIONAL MUSEUM: SELECTED DESIGN. SMITH AND BREWER, ARCHITECTS.

MURAL PAINTING.

By PROFESSOR GERALD E. MOIRA.

[*This is an abstract of a paper read by Professor Moira at the Carpenters' Hall, upon an ancient art that has been sadly neglected in modern times. Professor Moira is well known for his work in this branch of art, and probably his best known mural paintings are in the New Sessions House, London. In collaboration with Mr. F. Lynn Jenkins, he carried out the coloured gesso decoration in the Hall of the Trocadero Restaurant, London.*]

Mural painting has had a very chequered career. Whether we went far back to the earliest times or not so far back we could find the great use it had been put in recording the history of nations, and we should remain, perhaps, in ignorance of without this facile mode of expression. The tempera paintings in the tombs of Egypt helped us to decipher not only the life of that great nation, but the costumes of the people and the minute details of their crafts, metal work, wood construction, and even shipbuilding. With this work as a peg to hang their artistic ability upon, the Egyptians taught us colour (in a crude manner, perhaps) and design. Primary colours were arranged in a manner which has influenced all decoration down to wall papers. This tradition from Assyria, India, Persia, and Egypt came gradually westward, passing through a Byzantine phase, and reached Italy, the field of all that is most interesting in mural work. It spread over France, and later arrived in England.

What else did it give us? A knowledge of those ordinary workmen laying down the formation of decorative design which was to have an enormous influence on Italian work of the fifteenth and sixteenth centuries.

These men had no Royal Academy education, no Prix de Rome as a hall-mark of their ability, but every work these men did was literature—telling the story of their time more beautiful and convincingly than prose. So much for the commencement. It is hardly necessary to go back further, as the same conditions no doubt prevailed.

Rise of the Italians.

One day long after the laying-down of this foundation of decorative historical design came Giotto and a hundred and one others, who were rather more gifted as artists. The culture of the masses and the Church demanded something more. They learnt to see stereoscopically. By that I mean they had learnt to see things more in the round than the Egyptians. The figure, instead of being flat, which gave the Assyrian work such distinction, became more round, and the cast shadow, as the commencement of realisation of tone, crept in. It was advancement, and as advancement was praiseworthy. They used people around them as their models, mixing them up with history and allegory. All these men, Giotto, Botticelli, etc., had not sullied the traditions of decorative art.

The Serpent in Eden.

But one fine day came from the East a man who brought sweet gum, incense, and myrrh, and discovered some struggling artist who had not done so well in his altar-pieces and vases as his neighbour at the next stall. Perhaps he was uncomfortable as to where his Sunday dinner was to come from. This Hebrew dealer went to him and said: "Thy work is not so bright as the others; take this gum and dissolve it in oil of linseed." What was the result? To revolutionise—perhaps ruin—the great tradition of decorative work, the glory of the past. It was the origin of the Royal Academy and such-like institutions. But we to-day are trying hard to bring back some of the great work and big traditions of that past, so that perhaps this varnish will be in time forgotten. What I wish to bring to your notice to-night is not so much how they did their work or what medium they used.

The Triumph over Difficulties.

What I consider is more interesting are the reasons for such work, the difficulties which beset these men, and how they overcame them. As to-day, so in the past, these men had to deal with them. Giotto was employed by the Franciscans, and educated as he was in the type of conven-

Photo: Mansell.

MURAL PAINTING: THE "POVERTY" FRESCO IN THE CHURCH OF ST. FRANCIS AT ASSISI, BY GIOTTO.

tion so prevalent then, the usual stereotyped saint in a long garment, one marvels when one realises how he came to deal with that great patron saint of theirs (Giotto lived about one century after St. Francis) in his work in the church at Assisi. [A series of slides were shown of the mural paintings on the walls of the church at Assisi, illustrating the life of their patron saint concurrently with the life of Christ.] In them we find perspective, and the figures are those of men whom he (Giotto) was accustomed to see around him in his work. These people of the times were brought into the pictures the better to teach their meaning to the people. [Slides were shown of the "Triumph of Death" in the Campo Santo, the "Healing of Tabitha," and the Adoration of the Magi, by Botticelli.] In these, portraits of contemporary men are found, such as members of the Medici family—Cosimo, Giuliano, and Giovanni, and even Botticelli himself. They were not put in from a desire of the donor to appear better than the others, but to show that all classes were subservient to the great religious idea, that though man was a power yet he owed worship and humble service to God. The "Return of Ulysses" in the National Gallery, the lecturer said, was shown to impress upon us the necessity of using the dress of the time. If we painted the "Return of Ulysses" to-day, in modern dress, we should be ridiculed. Now we come to something that is more in our time, quite as important as St. Francis was to Giotto—the fresco in the House of Lords, of Wellington, by Daniel Maclise. Though it may have a lot of faults, still it is an attempt to do something of the man's time, that he knew something about; and though we laugh and jeer at it because of its early Victorian character, we cannot help admiring it on that score. Concerning a painting by Lord Leighton, also shown, the lecturer remarked that here we had a very beautiful type of work, and though we did not like to run down a man who did as much for poor decorators as Lord Leighton did, yet one could not help feeling that this example would soon become late Victorian, just as much as the fresco in the House of Lords is now early Victorian.

Modern Examples.

Next some slides were shown of work executed by Professor Moira himself at the Unitarian Church House, at Liverpool, representing the raising up of Truth by Time. All around are grouped portraits of great men of all ages. These were followed by illustrations of the decorations at the New Sessions House by Sir William Richmond, illustrating "Roman Law," "The Golden Age," and "Greek Law"; also illustrations of the lecturer's decorations at the same building.

Methods at the Sessions House.

In connection with these decorations the lecturer said they did everything they could in conjunction with the late Mr. Mountford (the architect) to secure a perfectly dry and therefore more or less permanent wall upon which to place their work. This was arranged as follows:—First, the outer wall of stone and brick, then an air space; then a wall of one brick thick, tied to the outer, the insides of these walls receiving a coat of paint. Then came another air space and then another wall, of reinforced stick and rag, that is, French plaster cast with layers of canvas and battens of wood with a thin structure of woven steel, galvanised, embedded at the back. Sir William Richmond had sent him the following description of his method:—

"The wall was prepared with slaked lime and marble dust. Two coats, one thick, the other thin. I tried three surfaces, one rough, next less rough, the other quite smooth; the last was by far the better method for the ground. When the two coats are nearly dry a thin layer of lime is painted over the whole surface, then rubbed down; but great care must be taken that the brush employed has not been used for white lead; it must be a new one. I was troubled by some carelessness on this score, which was, however, remedied by Professor Church, *i.e.*, a certain black stain. The design was then drawn in in charcoal, corrected, and then redrawn in raw sienna and white. Under blue I painted red, under flesh white, black, and raw sienna, warm and shade cool in lights; all else was painted at once as much as possible. *No* glazing, because it tends to darkness; all tints mixed with white, even glazing tints. Colours ground in water. In their powder, mixed fresh every day with the yolk of an egg; an equal body of egg mixed with an equal body of pigment. I took care not to lost my ground, because, by retaining it, a greater brilliancy is acquired. It is well to mix some vinegar with the egg; it keeps it fresh. *No* bad eggs should be used; they set up fermentation. The medium with which I painted was milk with no water; this causes the egg to dry as hard as stone, and is very binding. This method of painting includes all that can be done in oil; one can paint thick or thin, retouch as much as one likes, and scrumble in their colour for atmosphere, or where one needs to grey or lighten a tone. The colours I used are zinc white, N. yellow, yellow ochre, raw sienna, light red, Indian red, ivory black and cobalt, and a little terra verde. It and yellow ochre must be used carefully, raw sienna also, as all three colours are apt to darken from a distance. The great principle is that the drawing shall be sound at starting, for it is well to have to make no important changes, especially such as would involve painting dark over light. The yellow of the yoke entirely disappears in time, leaving the colours pure and fresh. Blue is a bit difficult to manage; it is best when painted over red if it is to be a purple blue, over yellow if a green blue, and it should not be loaded, as that results in a heavy effect."

Slides were shown of the cardboard sketch models of the interior, in which the sketches of the decoration were placed. It was essential, said Professor Moira, that one should have, in work of this kind, a good sketch-model to start with. As regards his own method, the lecturer said he laid a thin coat of marble chips and

MURAL PAINTING: THE ADORATION OF THE MAGI, BY BOTTICELLI.

white lead, doing the more laborious work in the studio and the finishing *in situ*. The canvases were fixed to the walls, which were prepared with two or three coats of white lead—very thick white lead and strong varnish, thus embedding the canvas in two layers of thick paint, in this way entirely shutting it off from access to the outer air. He painted in oil paint with a medium of hard white wax dissolved in turps: One quart of turps, ¼ lb. of hard white wax, 2 oz. of spike oil, 2 oz. of copal varnish, putting the oil and the varnish into the dissolved wax before it cooled down. Some further slides of the Sessions House work were then shown; also some frescoes in the old Hall of the Carpenters' Company, painted over at some troublous time and rediscovered in 1845.

Possibilities.

In conclusion, Professor Moira said that when one looks at the work of men of to-day, such as work by Mr. Frank Brangwyn, such as the frescoes round the Grand Trunk Railway building, one feels that it is going to live, for in it there is an allegory mixed up with the toil of our daily life. We don't want fluffy Greek maidens—the man in the motor car and the man in the silk hat are no more difficult to treat than the man in the sugar-loaf hat which we have seen to-night. It looks as if we were afraid of the man next door. Let us try and forget the man next door and do something on our own account. The lecturer concluded with expressing thanks to Sir W. Richmond, Mr. Frank Brangwyn, and others, for lending slides and other assistance.

NEWS IN BRIEF.

A catalogue of the collection of books, prints, and antiquities connected with Shakespeare, which are enshrined in the Museum at Stratford-on-Avon, has been prepared by Mr. Richard Savage, the secretary and librarian. The work, which is illustrated by photographs, contains a good deal of the biographical, historical, and bibliographical annotations which make it far more valuable than a mere list of exhibits.

* * *

A committee was formed in November last for the purpose of purchasing the full length portrait of the Duke of Wellington, by Lawrence, for Wellington College. The picture is in the hands of Messrs. Agnew and Co., who purchased it for 2,000 guineas on November 25th, and Mr. Lockett Agnew has agreed to sell the picture to the committee at cost price, giving them six months' grace to find the money. About £1,700 has been received to date, the King, the Prince of Wales, and other members of the Royal Family being among the subscribers.

The tenth annual exhibition of the International Society of Sculptors, Painters, and Gravers, opened on Friday last at the Grafton Galleries. This will be followed on May 21st by the Society's "Fair Women" Exhibition. MM. Rodin, Besnard, Gandara, Cottet, and the most distinguished Continental artists will be represented, and the modern work will be leavened by Goya and a few works by the older masters of special excellence.

* * *

The Roads Improvement Association has issued its supplementary report upon calcium chloride as a dust layer, the judges appointed being Mr. H. P. Maybury (County Surveyor, Kent), Mr. A. Dryland (County Surveyor, Surrey), Mr. G. W. Manning (Surveyor, Staines U.D.C.), and Mr. W. J. Atkinson Butterfield (analytical chemist). The judges are of opinion that the treatment has the ill effects of causing during the winter months an abnormal quantity of sticky mud, a decided tendency to licking up, and a disintegrating action upon the macadam surface. Notwithstanding this, they are of opinion that the process is probably not more injurious to macadamized roads than the excessive watering now demanded by the public effectively to lay the dust.

* * *

Some 40 or 50 works by members of the Chelsea Arts Club have been brought together by Mr. George Lambert and sent to the Düsseldorf Exhibition which is open for six weeks. Among the artists represented are:—*Painters*: Mr. W. Orpen, A.R.A., Mr. John Lavery, A.R.S.A., Mr. Lambert, Mr. Philip Connard, Mr. Robert Fowler, Mr. Glyn Philpot, Mr. J. Young Hunter, Mrs. Fagan (wife of the club's honorary secretary), Mr. Alexander Jamieson, Mr. A. Talmage, Mr. Alfred Hayward, Mr. W. Manning, Mr. Cecil Rea, and Mrs. Rea (Constance Halford). *Sculptors*: Mr. Derwent Wood, A.R.A., Mr. Bertram MacKennal, A.R.A., and Mr. Basil Gotto, and *Draughtsman*: Mr. George Belcher.

* * *

Eastbourne is to be extended by the inclusion of Hampden Park within the borough boundaries, and the Corporation Bill, which provides for this and for conferring the powers of a county borough on the municipality, will be practically unopposed. Compensation will be paid to the East Sussex County Council and the Eastbourne Rural District Council.

Mr. Edwin T. Hall, F.R.I.B.A., of 54, Bedford Square, W.C., draws our attention to an error in our announcement of the result of the competition for the new Examination Hall of the Royal College of Physicians and Surgeons. The design stated to have been submitted by him was really sent in by Mr. E. Stanley Hall, M.A., of the same address.

* * *

St. Mary's Parish Church, Peckham, is in danger of collapse, and an urgent public appeal is being made for £600 to complete the sum of £2,800 required for repairs. Mr. A. H. Ryan-Tenison, F.R.I.B.A., is the architect.

* * *

Mr. J. S. Gibson, F.R.I.B.A., of 5, Old Bond Street, London, W., is the architect for the new premises of Messrs. Arding and Hobbs, at Clapham Junction.

BOOKS.

The Craft of the Jeweller.

Simple Jewellery: A Practical Handbook. By R. Ll. B. Rathbone. London: Constable and Co.; 1910. 6s.

The full title of this little book states that it is a handbook "dealing with certain elementary methods of design and construction," and that it is "written for the use of craftsmen, designers, students, and teachers."

The keynote of the book is the principle that, in jewellery, design and workmanship should go hand in hand, and each should re-act on the other; in fact, we may take it that the author means that design in jewellery may often actually arise out of workmanship, and the tool become the unconscious prompter of the design. In condemning (in which we entirely agreed with him) the greater proportion of commercial jewellery, he does not deny that this often displays exceedingly clever workmanship, "but it fails to give us the pleasure it ought to do, because its ways are not those which bring out and accentuate the special and individual beauties characteristic of the precious metals, and because its methods of using precious stones are generally vulgar and aggressive."

In addressing the beginner in jewellery, Mr. Rathbone recommends him to pass over what he calls "pictorial and sculpturesque jewellery," such as much fine and sumptuous Renaissance work, as representing a class of work beyond a beginner; to fix his mind in the first instance on craftsmanship as the essential thing, and to study such examples of older work as represent the effects of craftsmanship, of the shaping of metal in numerous comparatively simple forms. Of such work some illustrations are given. And he recommends the beginner to try first the making of a number of what he calls units—small forms which can be made out of metal in various ways and by various instruments (which are described and illustrated), and which can be arranged into a great variety of designs. The student would thus make a first step in evoking design out of the manipulation of metal. Some very effective geometric designs "made up of loose units" are illustrated, and it is shown how a temporary trial arrangement may be recorded for future use. All this may seem to be only the A B C of jewellery; but it is beginning at the right end. The illustrations of a number of designs for silver charms on a small scale serve to show what a beautiful and effective variety of forms may be obtained merely by links twisted up and manipulated in different ways. Yet, in spite of this, we know how difficult it is to get, by purchase, a gold or silver watch chain which shows anything like artistic feeling. They mostly represent only a few stock ideas.

The book is a very practical one, and contains full instruction in the use of tools and in methods of manipulation.

THE CHAPEL OF THE RED MOUNT, KING'S LYNN.

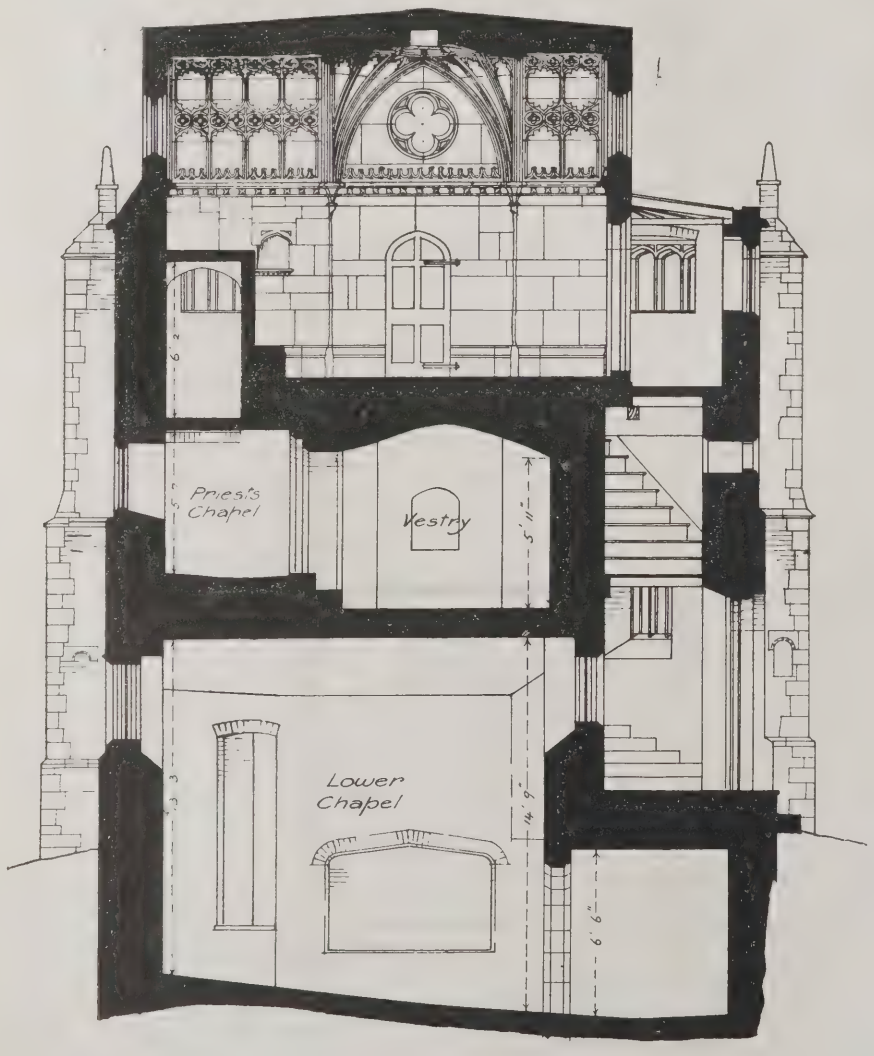
This rather curious octagonal building is perhaps all the more interesting from the fact that its history is indeterminate. Apparently it was designed to be almost as much a stronghold or "city of refuge" as a house of prayer; but fortunately it has escaped serious assault, and therefore preserves much work—such as the vaulting in the upper chamber, as shown on p. 284—that is worth inspection and will even repay study. The planning of the various floors (see p. 286) is worth examination; and on the whole, Mr. Ralph Surridge has not wasted his labour in measuring and drawing so quaint a building. Local repute connects it with several historical personages, among them Mary Queen of Scots, but there does not appear to be any authentic ground for these assertions. The building stands in the public park, not far removed from a fragment of the town wall.

THE CHAPEL OF THE RED MOUNT, KING'S LYNN: GENERAL VIEW.

FOUNDATIONS OF STAINED GLASS WORK.

By NOEL HEATON, B.Sc., F.C.S.

[*This is an abstract of an exceedingly interesting and useful paper read by Mr. Heaton before the Royal Society of Arts. Scientific and searching investigation into mediaeval work gives a less favourable impression of it from the technical side than the protagonists of the Gothic Revival would have us believe. It is not therefore surprising that Mr. Heaton should find that much of the mediaeval glass was less durable than the Roman that preceded it, or the modern glass that followed it. His lecture is also useful for its indication of how far the composition of glass to secure effect may be compromised with the composition to secure durability.*]



Stained glass differs from almost every other method of decorative painting in that the sheets which provide the ground, provide at the same time both the broad masses of colour and the outlines of the design, and the function of the paint is limited in consequence to producing the details of the design and stopping out the light in places, instead of producing it entirely as in the case of canvas or mural painting. The success of the work depends, therefore, to a large extent on the choice and quality of the glass to be painted, which, in fact, performs two functions—it provides the ground or fabric of the window, and it also provides that inimitable quality of colour and texture which makes stained glass what it is. It was not always so well-recognised as it is to-day that stained glass is painting *by means of* glass rather than on glass. Painting on glass, so characteristic of the work of the seventeenth and eighteenth centuries, is quite discredited at the present time, except for heraldic work on a small scale, for both æsthetic reasons and on technical grounds. It has a certain legitimate scope, but sacrifices the main feature of stained glass—the beauty of the glass itself.

Durability.

Glass must, more particularly, be highly resistent to atmospheric action under extremely trying conditions, being subjected to continual fluctuations of temperature, battered by storm and rain on the outside surface, and continually bathed in moisture containing more or less acid on the inside surface. This requirement

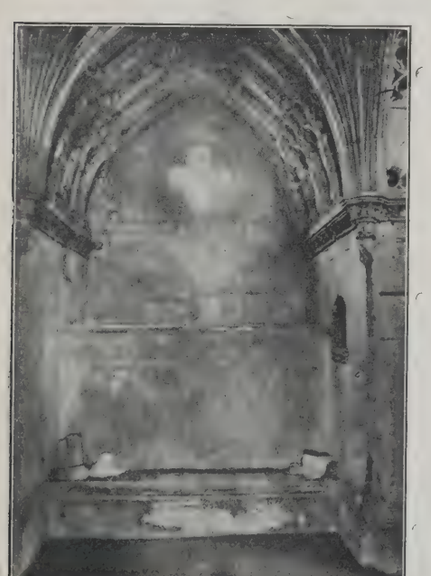
does not exclude the weathering action which gives to old glass one of its chief glories. The best glass ever made will be modified by weather exposure, but the better it is the more weathering will enhance its beauty rather than destroy it. Mr. Heaton produced a piece of glass dating from the close of the 12th century, on which the effect of 800 years of weathering had been merely to etch the surface. In contrast part of a quarry from York Minster, dating from 1310, or 150 years later, had been practically destroyed by pitting, and much of the glass from the same windows had disintegrated. Another example shown illustrated the decomposition of glass resulting in it becoming practically opaque. Mr. Heaton opined that no one would defend a specimen in which the refining effect of time had eliminated the design altogether.

Analyses of Roman glass, the quarry from York Minster and typical modern glass revealed the interesting fact that the composition of modern glass and Roman glass was practically identical. The essential ingredients are 1, silica, 2 an alkali (potash and soda), 3 an earth (lime, alumina or lead). In most cases more than one substance will be found under group 3. Stability depends on attaining a proper balance between the properties conferred by these three types of compounds, respectively. From the analysis Mr. Heaton drew the conclusion that the peculiar decay of Gothic glass is due to an excessive content of lime and magnesia and the presence of a considerable proportion of phosphoric acid. Of the three principal materials used in glass-making, sand, lime, and soda, the last, which is the element of weakness, is by far the most expensive, so that from motives of economy, the modern glass-maker uses as little as he can without raising the fusion point beyond the limits of his furnace.

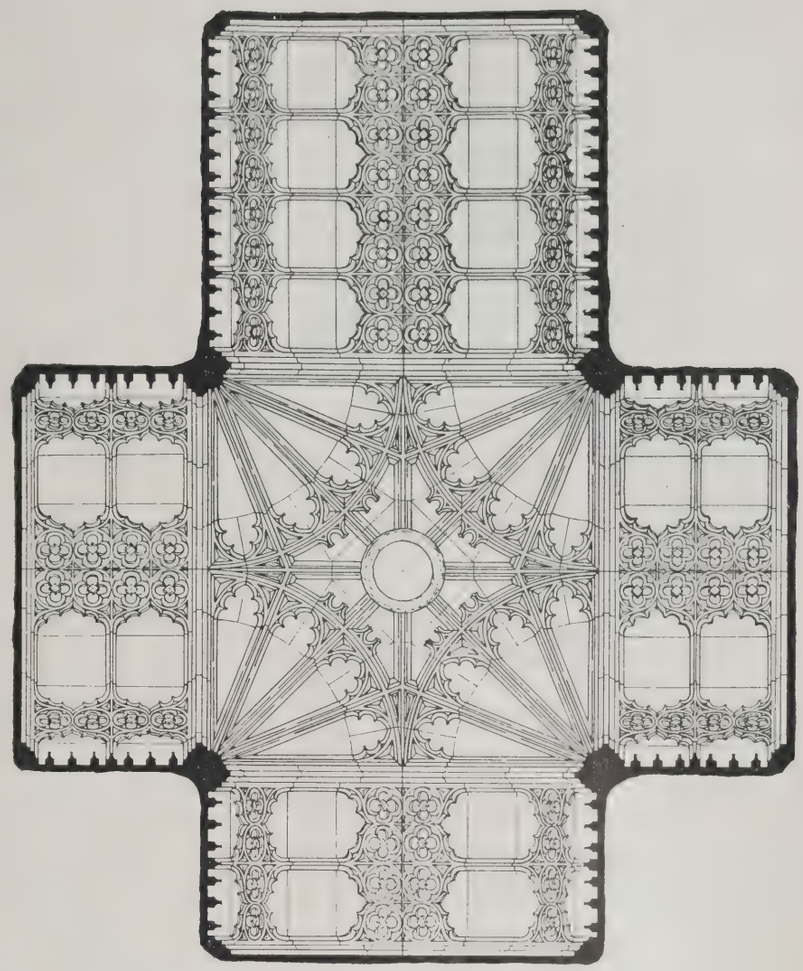
One Objection to Modern Glass.

Its general solubility for silver is not very great, i.e., it does not stain very nicely. It can, of course, be stained, but not with the rich deep stain of, say, the glass of Peckitt's time, and if fired at the temperature necessary for good hard colour it "metals"—the silver is thrown out of



solution too rapidly on heating—and the particles of metallic silver are deposited on the surface in more compact state, giving a dingy and greenish-yellow appearance, instead of the yellow colouration when the finely divided particles remain in suspension in the glass. Mr. Heaton thought this defect an unnecessary one, and one that could be remedied by slight differentiation in the composition of the glass.

Varieties of Glass.



These may be roughly summarised as: (1) Cast or rolled (cathedral, etc.). (2) Blown into cylinder (muff glass). (3) Blown and spun (crown glass). (4) Blown into mould ("Early English" slabs). The three first have been made from the time of the Romans, by whom they were introduced; the last is a modern introduction. The second and third were exclusively used in mediæval times, but the glass produced by these two methods in mediæval times, owing to the primitive character of furnaces and appliances, is very different in character from glass of similar classes to-day.

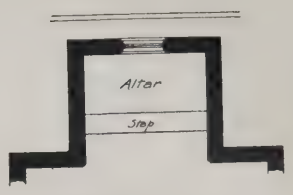
Paint for Painting Glass.

The paint is made by mixing an intensely coloured pigment with a glass of special composition called a "flux," grinding the two together to an impalpable powder, which can be employed as a paint. The glass painted in this manner being then raised to a red heat, the flux melts and acts as a vehicle to bind the pigment on to the glass precisely as the oxidised oil in a painting or the carbonate of lime in a fresco holds the particles of pigment. This paint, or fusible coloured glass, must fulfil certain stringent conditions which may be summarised thus: (1) Fusibility, or the property of softening at such a temperature that it can be fused on to glass without destroying the texture of the latter. (2) Durability, or the property of resisting the corrosive influence of the atmosphere indefinitely. (3) Opacity, or the property of producing decided opacity in the finest lines, and of retaining this quality through the firing. (4) Working qualities, or the capability of working easily in a brush when made into a paint. (5) Colour, or the property of retaining the same tone in all variations of light.

THE CHAPEL OF THE RED MOUNT, KING'S LYNN: RECESS IN UPPER CHAPEL.

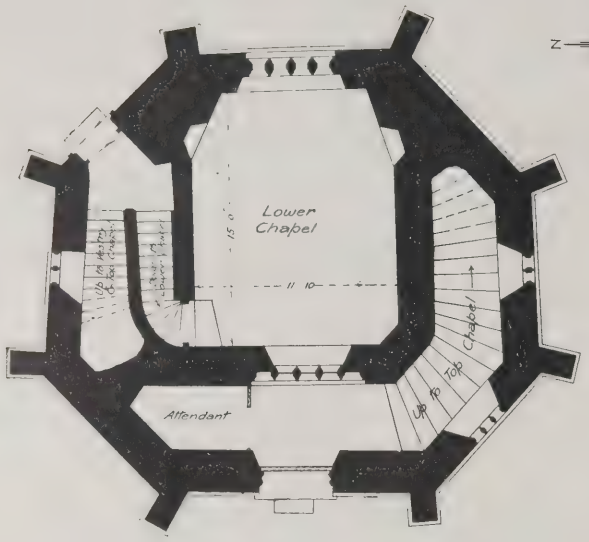
PLAN OF CEILING OF UPPER CHAPEL.

SCALE.



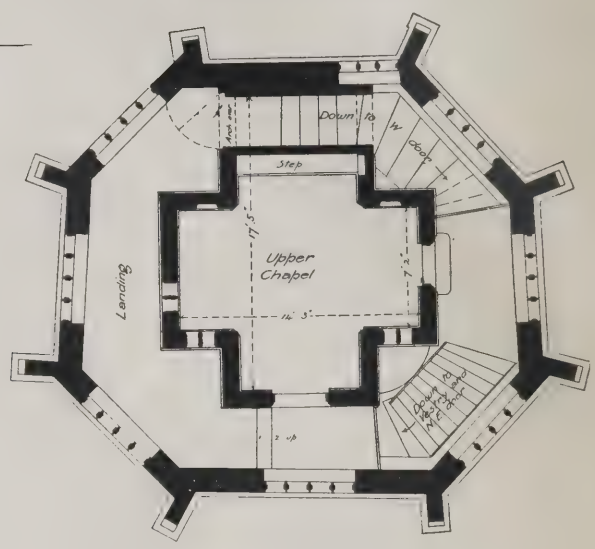
THE CHAPEL OF THE RED MOUNT, KING'S LYNN.

The pigments used in the preparation of this enamel must be such as have a very strong colour, are opaque, and are capable of being raised to a red heat without decomposition and without entering into the composition of the flux. This practically limits pigments to the oxides of the metals; and thus the oxides of iron, copper, cobalt, and manganese are almost invariably employed, either singly, mixed together, or combined together. In the last case chemical combination is the condition, not mechanical mixing; valuable pigments are obtained in this way, which cannot be produced by mere mixing.



The flux, however, is the most important part of the enamel, since the fusibility and durability depend on it. Some glass painters have been under the impression that permanency depends on the picture; but as the flux binds the pigment to the glass, the pigment is not of much value in the picture unless the flux keeps it where it is put. The actual composition of the flux is a compromise between the two conflicting requirements of fusibility and durability. Generally speaking, the more fusible, the less durable it is, and *vice versa*, so that in practice it is made as durable as possible consistent with making it sufficiently fusible to fire properly. The general aim is to make the composition of the flux as near as possible like that of the glass on which it is to be painted, so that its physical properties may approximate, since it is necessary that the flux, besides resisting decomposition, should expand and contract in harmony with the base glass.

The Importance of a Coloured Flux.



In all published records the flux usually described in the preparation of the enamel is a colourless or transparent glass. This is not the case as regards mediæval glass, for the mediæval workers used as a flux an intensely coloured glass to mix with the pigment. This is a very important difference, and explains the difficulty of the modern glass-worker in reproducing satisfactorily the extremely fine but vigorous lines met with in mediæval examples. The vigour of these fine lines depends entirely on the opacity of the enamel, and if the flux is transparent everything depends on the pigment, so that the painted surface is only partially opaque. But if the flux is opaque, then every portion of the painted surface is opaque. This does not make much difference where a broad mass of the enamel is laid on, but in the case of an

SCALE OF FEET.

THE CHAPEL OF THE RED MOUNT, KING'S LYNN. MEASURED AND DRAWN BY RALPH SURRIDGE.

extremely fine line, where there are only a comparatively few particles, each particle of pigment tends to become isolated and surrounded by a mass of flux. If the flux is transparent, the line becomes "rotten."

Moreover, as the particles of flux are generally somewhat larger in size than those of the pigment, the brush tends to catch up the flux and draw it out. In consequence, the end of the line tails off into transparency. Another value in the opaque flux is that it does not lose its opacity so much in firing. This "firing-away" has always been a trouble, because it results in the painting losing strength in the process of firing, and the finished work is lacking in modelling. This firing-away is largely optical effect. Any transparent substance like glass becomes opaque white when in a state of fine division, owing to the reflection of light from the surface of its particles. If you use a powder of this nature as a paint and fuse it, you reproduce the original transparency and inevitably suffer a considerable loss of opacity. But in the case of an opaque glass the additional opacity introduced by powdering is only a small addition to that already existing, and the inevitable loss on firing is nothing like the same proportion.

The coloured flux also modifies the colour of the enamel so as to obviate the unpleasant change of colour when seen by transmitted as compared with reflected light. This is due to the fact that the warmer colours of enamel are produced by oxide of iron, which is black by transmitted and red by reflected light, so that the painting on a window executed with an enamel in which it constitutes the pigment varies according to the angle at which it is seen. The deep brown colour of the flux neutralises this, because it is black by reflected light but warm brown by transmitted light, one change balancing the other as the angle of view is altered.

Necessity for Both Artist and Craftsman.

Mr. Heaton dealt at considerable length with the composition and manufacture of the flux and the firing of the glass, modern kilns, and other technical details of the craft, and in conclusion indicated that, in his opinion, "division of labour is essential in such a craft as stained glass. The artist cannot be expected to prepare all his materials as some would have him do, nor do I think he would be much better off if he did. It seems to me that stained glass—and, indeed, every artistic craft—is not only an art but also a science. There must be two sets of workers—the artists and those who work for them—but these two must work together to the same end if the best results are to be achieved; and to render this possible, each must understand and appreciate the aims, the problems, and the difficulties of the other. There must, in fact, be co-operation between science and art."

A NEW PUMP.

[The Humphrey Internal-Combustion Pump is an entirely new type of 'pump' self-acting and for which there is likely to be a very large variety of uses, both as a pump and as a prime mover displacing the steam engine. The principles of this pump were described in detail by Mr. Humphrey at a meeting of the Institution of Mechanical Engineers. A simple form of pump of this type and its action is described below; the different applications are manifold, as the reader can readily deduct for himself.]

The pump consists essentially of a full bore pipe from the combustion chamber (C) to the high-level tank (H.L.) at the end of the delivery pipe A. At the upper end of the combustion chamber two valves are fixed, one for the admission of gas and air, and the other for exhausting the burnt products. The exhaust valve is opened by levers connected with the low level tank valve (V), which opens under conditions described later. Gas and air mixture being admitted to the upper portion of the combustion chamber, the gas is exploded by electric spark from the sparking plug K. The water in A and in the lead pipe is rapidly driven towards the high level tank.

As the pressure of the gas continues, so the velocity of the water increases until finally it has a store of energy. This assists the progress of the water towards the overflow at high level tank, the gas expanding until the pressure is equal to atmospheric pressure, less the amount due to the static head of water. The stored-up energy in the water, however, maintains the flow away from the combustion chamber, and creates a partial vacuum, whereupon the valve V opens automatically by the water pressure from lower tank, and more feed water enters the pipe A. This valve also releases the exhaust-valve; and the kinetic energy of the water by this time being exhausted, water begins to return back to the combustion chamber. The partial vacuum in the pipe A having now disappeared, the valve V closes. The returning water forces the burnt products of combustion out of the exhaust valve, but when the water reaches the exhaust valve the force of impact is sufficient to close the valve, a pawl attached to the levers alone locking it fast. The remaining air then acts as an elastic cushion and brings the water to rest, but expanding again drives the water back down the combustion chamber, causing therein a partial vacuum. This allows a fresh mixture of gas and air to enter the chamber through the inlet valve, and the head of water in the delivery pipe causes the water to return again, compressing the newly admitted gas and air and closing the admission valve.

A spark from the plug K then ignites this compressed air and gas mixture, and the cycle of operations is again commenced. This is in short the operation of the pump. Its applications are many. Besides acting as a water raiser it can also be used as a prime mover, for by the insertion of a water turbine in the flow pipe rotary power can be obtained. Of course there are many mechanical modifications in the apparatus necessary in such a case, but the principles are the same.

Dr. Unwin has made tests officially of the pump, and says that the pump tested worked throughout the trials with varying lift automatically without any change. Comparing it with a centrifugal pump driven by an ordinary gas engine and lifting the same quantity of water, he says, gas engine and centrifugal pump uses 120 to 127 cubic feet of gas per p.h.p., Humphrey gas pump uses 83.1 cubic feet per p.h.p.

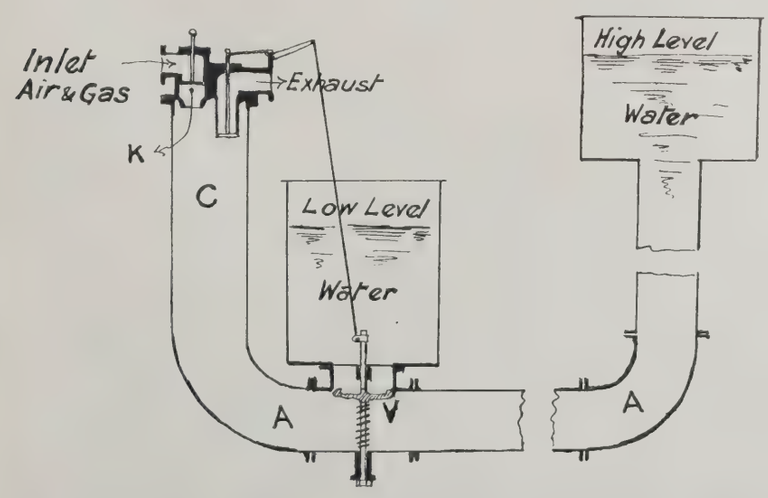

DIAGRAM SHOWING THE PRINCIPLE OF THE HUMPHREY INTERNAL-COMBUSTION PUMP.

WHAT IS A BUILDING?

BY A LEGAL CONTRIBUTOR

The above question may appear, at first sight, to be fairly simple; but there is more in it than meets the eye. Not only has the term "building" acquired a special technical meaning under the London Building Act, 1894, but as used in various by-laws throughout the country it often includes far more than would be imagined by one who was not familiar with the interpretation put upon those by-laws by the decisions of the courts. Again, when one has to consider the effect of covenants relating to light, the meaning of building may be somewhat difficult to arrive at.

Let us first consider the meaning of the term as used in the London Building Act, 1894. Although the Act contains many definitions, "building" is nowhere defined, save that the meaning of the terms "domestic building," "public building," and "new building" is specially explained.

It is of interest to mention, however, that when the London Building Act left the House of Commons it contained the following definition which was struck out by the House of Lords: "Building means an erection comprising a cubical space defined by walls, piers, posts, columns, or other supports or enclosures, and a roof, whether the erection is wholly enclosed or not, and whether it is fixed on permanent foundations or not, and of whatever material the supports, enclosures, or roof may be composed."

Although this definition is not law, every roofed erection enclosing space must now be considered to be a building, as by S. 201 (10) erections not exceeding in area 30 square feet and not exceeding in height 5ft. to the eaves or roof plate are referred to as buildings.

The following have been held to be buildings within the meaning of the London Building Act:—A timber stage of two storeys, the lower of which was fitted with revolving shutters. A timber stage of three floors used for storing cut timbers, enclosed on each side by a party wall, but open at the front and back, the floors being supported upon timber uprights and approached by an internal staircase, the whole being covered by a zinc flat, was held by Mr. Newton, at Marlborough Street P.C. on January 26th, 1893, to be a building, and was ordered to be enclosed on the front and back by proper walls (*Wallen v. Gluckstein*, February 3rd, 1893). In another case (*Mayor of South Shields v Wilson*, 1902), a wooden erection about 20ft. by 20ft. and 12ft. high, to be used as a stable, on private ground, enclosed by a fence excluding the public, has been held to be a "new building" within the Public Health Act, 1875, and must therefore comply with the local by-laws.

The same Act contains certain provisions which affect any "building, structure, or work." With reference to these, if erection is contemplated, the builder or other person causing or directing the work must serve on the district surveyor a building notice. To what kind of erection does this provision relate? It has been decided that a "street box" used for electric lighting and established in accordance with the terms of a provisional order under the Electric Lighting Acts, 1882 and 1888, is a "building, structure, or work" within this section. But neither a removable temporary seating fixed inside a large public hall when required by persons having the hall for show or exhibition, nor a temporary floor in a swimming bath, which did not, and was not likely to, affect the building or swimming bath in which it was constructed, was held to require a notice. In the case of *London County Council v. Humphreys*, 1894, 2 Q.B. 755, it was held that a corrugated-iron and wood building erected not for use upon the spot, but placed there merely for the purposes of sale, and as a specimen of wares sold by the defendant, though a structure of a movable and temporary character, required no licence from the Council under the Metropolis Management and Building Amendment Act, 1882.

That part of the London Building Act, 1894, which relates to the lines of building frontage, also deserves notice in this connection. By S. 22 no "building or structure" shall without the consent in writing of the Council be erected beyond the general line of buildings, subject to the exceptions specified in the section. The decision as to what is or is not a "building or structure" is a question of fact. The following have been held to come within the phrase: A garden wall; a 14-in. wall 11ft. high, built in substitution for a dwarf wall with an iron railing; an iron and glass shelter or portico bracketed out from a building projecting about four feet over the public way. On the other hand, a number of advertisements consisting of metal cases with wood and canvas fronts arranged to be lit by electric light, and fixed by iron supports to the front wall of a house, from which they projected 10ins. beyond the general line, were held not to be "structures."

Coming next to the meaning of the term building in a covenant contained in a deed, much depends upon the surrounding circumstances. Thus the erection of wooden hoardings, for the purpose of advertisement, fastened to the premises, is a breach of a covenant not "to erect or make any building or erection on any part of the demised premises." But the erection of an advertisement hoarding is not a breach of a covenant that any "building" which should be erected on the land should be of a certain height, and have a stuccoed front and slated roof, and be used only as a dwelling house. The

construction of a railway embankment has been held to be a breach of a covenant not to erect any buildings on the land conveyed other than private dwelling-houses; but a covenant to keep land open and unbuilt upon is not broken by making an underground urinal.

In one case (*Boyce v. Paddington Vestry*, 1903, 1 Ch. 109) it was held in the circumstances of the case that a hoarding was not a building. Lord Justice Buckley said: "From the cases I derive no principle other than this, that a hoarding may or may not, according to the contract, be a building."

In a case referred to in "Emden's Building Contracts" (4th edition), p. 663, a deed of conveyance contained a covenant by the defendants to erect certain buildings, and a further covenant to the effect that "no other . . . building . . . shall at any time be erected upon such piece of land, except with the approval" mentioned in the deed. The defendants erected stone steps in substitution for an iron ladder. It was held that this was a substantial alteration which amounted to the erection of a separate building.

Under the Prescription Act, certain rights to light can be acquired by long user for a number of years. It has been held that a permanent structure used for storing and seasoning timber was not a building within this Act, but that a greenhouse was a building. A greenhouse was held to be a building in *Clifford v. Holt*, 1899, 1 Ch. 702, where Kekewich, J., said: "Here we have a greenhouse. If it were a studio—either an ordinary studio, or a photographic studio, or a picture gallery—detached from the house, it would be a 'building.' If it were a conservatory attached to the house, it would be a part of a building. It is difficult to say more than that this is a 'building.' I prefer to leave it an open question what other erection may come within that description."

NEW BUILDINGS.

PROPOSED.

Bacup.—A Local Government Board inquiry has been held at Bacup by Mr. M. K. North, M.I.C.E., into an application of the Bacup Corporation to borrow a sum of £10,000 for the widening and improving of a long stretch of Burnley Road, commencing at Bull's Head Bridge in the centre of the town. The scheme embraces the arching over of the River Irwell for a quarter of a mile of its length, and one portion of it will form the approach to a magnificent new post office, which is to be built on a site at Hempsteads presented by the Mayor, and for which the Government Office of Works have prepared the plans. A portion of the cost of the scheme will be borne by the County Council.

Brentford.—The Finance Committee of the Middlesex County Council has recommended that application be made to the Local Government Board for their consent to the borrowing of, for alterations to the Town Hall, Brentford, the sum of £2,400 for thirty years.—Agreed.

Cardiff.—The Finance Committee has recommended the Council to adopt the scheme for the erection of a public disinfecting station, estimated to cost £2,313 18s. 9d., in Crawshay Lane, off Penarth Road, on the site now occupied by the Mortuary yard.

Croydon.—A central site at the top of Handcraft Road, in the parish of Christ Church, costing £750, has been secured, and it is now proposed to proceed with the building of a Parochial Hall at a cost of £2,000, inclusive of heating and lighting. The new proposed hall will include a large hall to hold 450; a smaller underground hall; and kitchen and cloakroom accommodation. Mr. E. G. Cole, M.S.A., is the architect.

Elstow.—It is proposed to erect a Bunyan Memorial Hall in this Bedfordshire village, where Bunyan was born. The site has been given, and the cost of the building will be £1,800, of which £1,000 has already been raised.

Felixstowe.—Mr. R. H. Bicknell, M.I.C.E., Local Government Board Inspector, has held an inquiry into an application by the Urban Council for permission to borrow £170 for works of street improvement in High Street, Walton, and a further sum of £1,000 for work in connection with the pavilion on the Hamilton Terrace cliffs, and the laying out of the cliffs. Of the £1,000 £400 is for excess expenditure and £600 for new work.

Fife.—The West of Fife Infectious Diseases Joint Hospital Committee have agreed to recommend to the local authorities who are partners in the combination to approve of a scheme for an extension of the hospital estimated to cost £10,306, and to forward plans to the Local Government Board for their approval.

Glasgow.—The Glasgow Corporation is considering a recommendation by the City Improvements Committee to demolish the old properties on the west side of the High Street between Bell Street and the Trongate, and to erect new buildings at an estimated cost of £28,000. It is estimated that a rental of £2,120 would be secured from the new buildings.

Hinckley.—The Guardians have approved the plans of the new infirmary and laundry, the total estimated cost of the scheme being £7,736. Plans have also been prepared for alterations and enlargements to the Boardroom, at an estimated cost of £200.

Pitlochry.—It is proposed to erect a new hall in connection with Pitlochry Established Church, from designs by Messrs. Leonard and Morris, at an estimated cost of £800.

Reading.—Mr. Brook Kitchin, F.R.I.B.A., the Local Government Board architect, has provisionally approved the scheme of the Board of Guardians, to enlarge the existing workhouse, which will include the erection of an aged and infirm block, new committee room, and mortuary, and alterations to the master's office and matron's stores. The special committee recommend that the plans be approved, and tenders invited for the work; and also that Mr. Roland Howell, the Guardians' architect, be engaged to prepare the necessary drawings, etc.

Sheffield.—The City Council has applied to the Local Government Board for sanction to borrow £7,640 in connection with the widening and improvement of Chesterfield Road. The portion of the widening is from Meersbrook Bank Road to Whitehouse Crescent, a distance of about three-quarters of a mile, and the present average width of about 35ft. will be extended to a minimum of 50ft., and a general width of 60ft. The estimate for the purchase of the necessary land is £1,459; the retaining walls are to cost £3,520, streets and other works £2,461, and costs are estimated to amount to £200.

Shipley.—An inquiry has been held by Mr. Courtenay Clifton, one of the inspectors for the Local Government Board, in reference to an application of the Shipley District Council for sanction to the borrowing of £4,010 for the purposes of the public baths and the depot of the Council on the Manor House estate.

IN PROGRESS AND COMPLETED.

Aberdeen.—The Plans Committee of the Aberdeen Town Council has approved of plans of the following buildings:—Tinplate factory, Roslin Place, Mr. John Rust, architect; fishcuring premises, South Esplanade West, for Mr. Harvey Mennie, architect; workshop at Nos. 37-41, Chapel Street, ; fish oil factory on Old Ford Road, Mr. G. F. Anderson, architect; fish oil factory, Russell Road, Messrs. Walker and Duncan, architects; alterations, Royal Army Medical Corps (T.F.) headquarters, Fonthill Road, Mr. A. H. L. Mackinnon, architect.

Ashford.—The contract for the new Drill Hall has been secured by Messrs. G. E. Wallis and Sons, of Maidstone, their price being £5,079. Mr. F. G. Hayward of the firm of Messrs. Worsfold and Hayward, Dover, is the architect. The flooring will be formed of the Kleine patent fire-resisting material, with patent jarrah wood blocks, while the whole of the roof will be covered with special Eternit asbestos.

Bury.—The Paving and Sewering Committee of the Corporation have approved the following plans:—Rebuilding of a portion of Brick House Mill, Wash Lane; Elementary School, Elton; addition to ironworks of R. Roberts, Ltd., Woolfold; boarders' dormitories at St. Joseph's Convent.

Derry.—The Corporation have accepted the tender of Messrs. Henry Laverty and Son, Belfast, for the rebuilding of the Guildhall, which was destroyed by fire on Easter Sunday, 1908. The City Surveyor has prepared the designs, and the accepted tender amounted to £24,584.

Dumbarton.—The engineering and boiler works of Messrs. Denny and Co., Dumbarton, have been largely extended within recent years. Still another important extension is now in process of being carried out. Dumbarton Dean of Guild Court has granted lining to the firm for the erection of a large machine shop, a small machine shop, and a valve shop. The contract for the extension is in the hands of Sir William Arrol and Co, Glasgow, and the cost will be about £50,000.

Dumfries.—The restoration of the Midsteeple, one of the landmarks of Dumfries, has just been completed at a cost of over £1,400. The building, which is 200 years old, now presents a comparatively new appearance. During the time of Burns a portion of the buildings was used for holding meetings of the Town Council.

Dundee.—At a recent meeting of the Dundee Harbour Trustees, the reconstruction of Camperdown West Roundhead was considered, and it was decided to adopt the subcommittee's recommendation to build the jetty 5ft. 6ins. further into the river than the existing jetty. The cost of the work is estimated by the engineer to be £4,600. The engineer reported that the reconstruction in reinforced concrete of the pier at Broughty Ferry had been completed, and that the pier was now ready for traffic. The cost of the work had been £23,000.

Grangemouth.—The new High School, which has been built at a cost of £9,000, has been opened on completion, and provides accommodation for 400 pupils. Messrs. Wilson and Tait, Grangemouth, were the architects.

Hawick.—The scheme for the enlargement and mprovement of Wilton Parish Church has been completed, having been carried out at a total cost of £7,000. To the nave, with its arcade of Caen stone, built by the heritors in 1860 to the design of Mr. J. T. Emmett, London, there have now been added transepts, transept aisles, chancel, and baptistery. The work, which includes early English mural arcading in chancel and baptistery, a font of Caen stone and Iona marble, handsome elders' stalls and open screens carved in oak, and a communion table, also in oak of elaborate design, placed on a pavement of Iona marble, has been designed throughout by the architect, Mr. James P. Alison, F.R.I.B.A., Hawick.

Lancaster.—The Town Council has approved the following plans:—Alterations to two cottages, Fleet Square; new drying kiln, Brunton Road; two dwelling-houses, Redvers Street; new stable, Slyne Road.

Paisley.—The Paisley Dean of Guild Court has passed the following plans:—Pattern shop, works of Thomas White and Sons (Limited), Laighpark; two semi-detached cottages at Arkleston Road; three tenements of four storeys, Dunn Street; additions and alterations to Calside Villa.

Torry.—The plans of the new Roman Catholic Church and Presbytery have been approved of by the Aberdeen Town Council. The church, which will cost about £4,000, will provide seating accommodation for 400 people, and will be of Norman design, comprising a large square central tower and a flight of steps leading to façade. The architect is Mr. Charles J. Menart, Glasgow. The mason work will be executed by Mr. David Weir, the carpenter work by Mr. Mercer, the slater work by Mr. John Durnin, and the plaster work by Mr. Bannochie.

ENQUIRIES ANSWERED.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional, or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The Editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned, but the enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies, or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s., made payable to Technical Journals, Ltd. and crossed, and stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

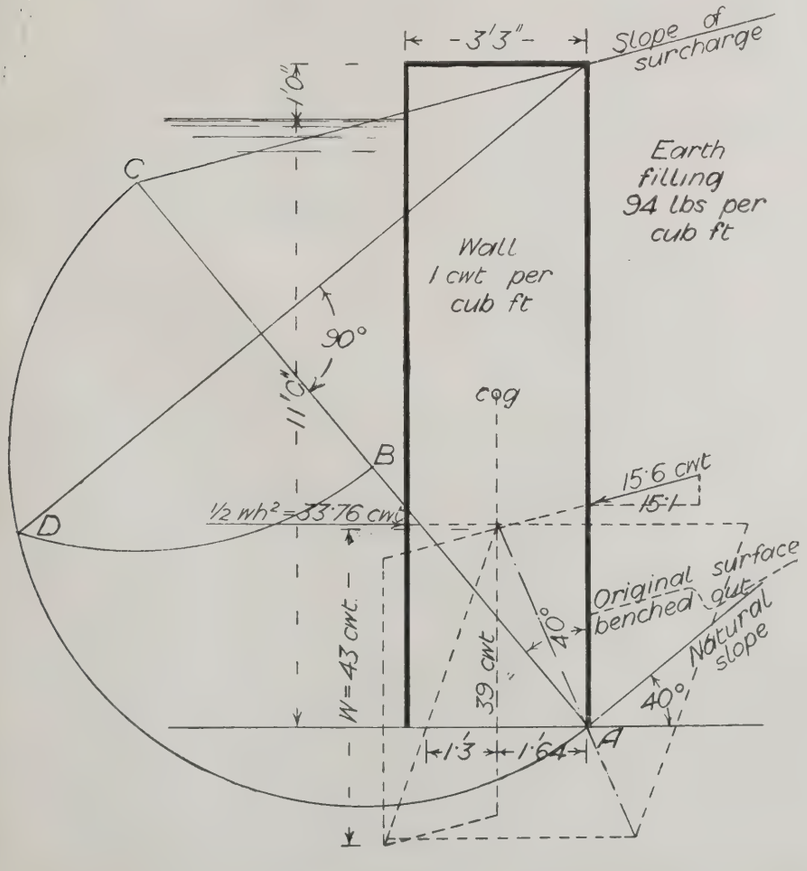
This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable, and it must be understood that both question and reply will, as a rule, be published in these columns.

Stability of River Wall.

H. S. (VICTORIA PARK) writes: "I should like your opinion as to the stability of the river wall shown on the enclosed sketch [not reproduced]. It is proposed to build the wall in Portland cement concrete, composed of 1 part cement to 6 parts of Thames ballast. In the event of the section shown being either insufficient or too heavy, kindly give a sketch with dimensions of a section suitable for the requirements. I should be glad if your expert would give an illustration and explanation of the method (with the necessary formulæ) for calculating the section of this wall. Can you recommend a small text book dealing with the calculations, etc., relating to retaining walls, and the graphic method of determining their stability and sectional area?"

—The accompanying illustration shows the proposed wall with the thrusts worked out for 1ft. run of the wall. Before any filling is done, the existing surface must be benched out to prevent any tendency to slip, and the filling must be done in layers well rammed. The nature of the material of the filling is not given, but it may be assumed to have a natural slope of about 40 degrees. This angle should be set off as shown, and the line of rupture found by bisecting the angle between the natural slope and the vertical. The wedge of the earth between the line of rupture and the back of the wall is the effective portion in producing thrust. The weight of the wedge, assuming the earth to weigh 100lbs. per cubic foot, will be



$$\frac{22\times 10{\cdot}5}{2}\times\frac{100}{112}=103 \text{ cwts.}$$

At one-third of the height from lower ground level to upper ground level draw a horizontal line for the position of the centre of pressure, and from the intersection of this with a vertical line through the centre of gravity of the wedge, which in this case will also be the intersection with the line of rupture, set up the weight of wedge 103 cwt., and from the upper extremity draw a line parallel with the line of rupture to cut off a portion of the horizontal line which will be the total thrust from the earth = 50 cwt. Now find the weight of the wall above the lower ground level, assuming it to be of concrete composed of 1 part standard Portland cement, 3 parts clean sharp sand, and 6 parts screened ballast, and weighing, say, 120lbs. per cubic foot $=22\times\frac{8{\cdot}5+3}{2}\times\frac{120}{112}=135$ cwt.

Then find the centre of gravity of this portion of wall and drop a vertical to cut the horizontal line of thrust. From this intersection draw the parallelogram of forces as shown, giving the resultant which produced cuts the base line A B at 1ft. 6ins. beyond the centre. The vertical component of the resultant being 135 cwt., the maximum stresses on line A B at low water will be

$$\frac{W}{A}-\frac{M}{Z}=\frac{135}{8{\cdot}5}+\frac{135\times 1{\cdot}5}{\frac{1}{6}(1\times 8{\cdot}5^2)}=16+18=34 \text{ cw}$$

or 1.7 tons per sq. ft. compression at A, and 2 cwt. or 0.1 ton per sq. ft. tension at B, which will be perfectly safe. To find the stresses at high water, calculate the total pressure of the water upon the face of the wall, thus, $\frac{1}{2}whl=\frac{1}{2}\times\frac{62{\cdot}5}{112}\times 16.5\times 17=78$ cwt., which acts at right angles to the face at one-third the height from lower ground level to high water level. From the intersection of this thrust produced, with the previous resultant, draw a new parallelogram of forces, the resultant of which cuts the base A B at 1ft. inside the centre line. The vertical component of the resultant being 154 cwt., the maximum stresses on line A B at high water will be $\frac{W}{A}+\frac{M}{Z}=\frac{154}{8{\cdot}5}+\frac{154\times 1{\cdot}0}{\frac{1}{6}(1\times 8{\cdot}5^2)}$ $=18+12.8=30.8$ cwt., or 1.54 tons per sq. ft. compression at B, and 5.2 cwt. or 0.26 ton per sq. ft. compression at A. The thrust of the earth tending to overturn the wall will be increased if any building is erected upon the top of wedge, or if water gets behind the wall, but without further particulars no assistance can be given as regards these matters. HENRY ADAMS.

STABILITY OF RIVER WALL.
DIAGRAM ILLUSTRATING ANSWER TO H. S. (VICTORIA PARK).

Right of Light Question.

TRUSTEE writes: "A firm of manufacturers some ten or twelve years ago erected a wall, which was intended to be the outside wall of a proposed future workshop, and to serve, at the same time, a further purpose of reserving their own right to complete a future extension parallel with lately erected cottages, some 14ft. away. These cottages would, in course of time, have secured a right of light and thus prevented any proposed extension of the manufactory in the manner intended. This wall, running parallel with the cottages, on the boundary line of the manufactory, is of sufficient height for three floors with three tiers of window openings, in which were inserted the iron frames without glazing.

"Can the proprietor of the cottages obtain any injunction or damages against the manufacturers, if the latter now complete their original intention of building the remaining walls and roofing over the new extension?

"There undoubtedly has been a small amount of light shed through the top tier of window openings only on to the cottages, and it is upon this that all seems to hinge. If the extension of the building be now completed and roofed in, it would be annulled."

—In order to give a right of action for obstruction of light there must be a substantial deprivation of light, sufficient to render the occupation of the house uncomfortable, or to prevent the plaintiff from carrying on his accustomed business on the premises as beneficially as he had formerly done (*Wilson v. Queens Club* [1891] 3 Ch. 522). The question, therefore, seems to be —Is the amount of light shed through the top tier of windows of vital importance to the occupiers of the cottages? There is no recent case in which this question of limited right of light has been discussed; but Lord Justice Farwell has pointed out that the test whether the stopping up of light is a nuisance is not—How much light has been taken, and is that enough materially to lessen the enjoyment and use of the house? but—How much is left, and is that enough for the comfortable use and enjoyment of the house according to the ordinary requirements of mankind? (*Higgins v.*

Betts, 1905, 2 Ch. 211). Applying this test, it is conceived that, in the circumstances of this case, the occupiers of the cottages could prefer no valid claim for nuisance. B.

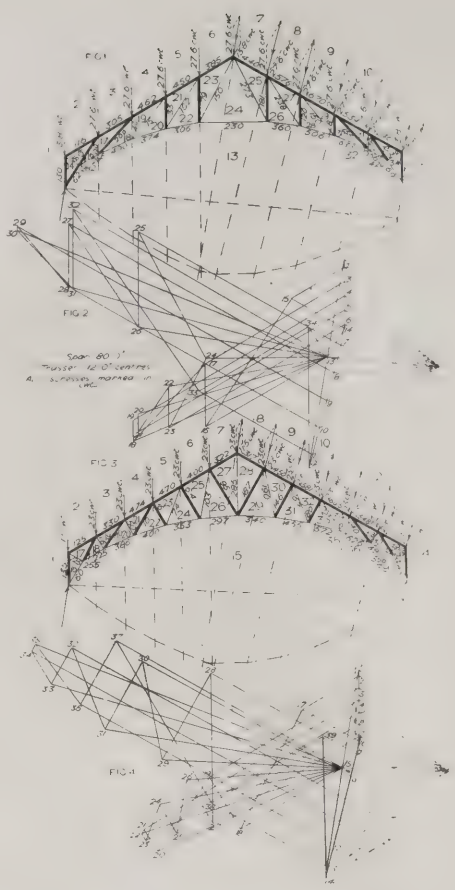
Covering for Concrete under Linoleum.

R. G. K. (BRADFORD) writes: "Some floor boards which have been nailed to coke breeze concrete in a dwelling room have been covered with linoleum, and dry rot has occurred in the boards. Can you tell me of a finish to the floors, on which the linoleum could be placed, which would be warm? Cement is complained of as being too cold.

—Coke breeze concrete laid on the ground retains moisture and would cause any floor boards nailed to it to rot even if they were not covered with linoleum. On an upper floor, trouble from damp might be avoided if the floor were given sufficient time to dry, but the covering with linoleum would so shut in the floor boards that rotting would be almost inevitable. Instead of floor boards the concrete might be covered with felt about 3-16ths in. thick laid with butt joints, say, "impregnated felt" made by Mitchells, Ashworth, Stansfield and Co., Ltd., Elmswood Mills, Leeds, or "bituminous hair felt," made by S. Anderson and Son, Ltd., Lagan Felt Works, Belfast, either of these covered with linoleum would give a warm floor.

HENRY ADAMS.

Responsibility for Dealing with Drainage or Sewage.



G. E. (BARROW-ON-TRENT) writes: "A, B, and C own a ditch, which discharges on to a high road. Can C, who owns the portion nearest to the road, be compelled to deal with the drainage or sewage? Has he any right to have it connected to an existing drain in the road?"

—The facts are so inadequately stated in the query that it is not easy to answer. It is almost impossible to define the relative rights of A, B, and C, without a very much fuller statement of the case. It would seem that the sewage from the land of A and B flows over that of C. By what right is this? The answer to this question is important, but not vital to the problem now propounded. It is clear that if there is a sewer under the highway, C has a right to connect the ditch with it. But his right may be even more extensive. It would seem that, as the ditch receives effluents from several houses, it is really a sewer, and as such is repairable by the local authority. In the case of *Kirkheaton Local Board v. Beaumont* (1888) 52 J.P., 68, it appeared that several houses and a slaughterhouse of the respondent drained into a road drain which was a sewer and the latter into a ditch in a field of the respondent, where it was a nuisance. The Board wanted the ditch to be covered up, but the respondent contended that it was a sewer, and that it was the duty of the Board to cleanse or cover it up. The ditch was held to be a sewer, and therefore had to be seen to by the Board. "C" should communicate with the local authority.

B.

Calculations for Barley Bins.

K.A.C. (GORLESTON) writes: "Some time back you worked out the various strains in steelwork to barley bins, particulars of which I forwarded to you. I enclose further particulars. Presuming the sizes of joists to be as first indicated by me, i.e., valley joists 12ins. by 6ins. by 45 lbs., purlins 10ins. by 5ins. by 36lbs., could you give the best method of strengthening same to carry the required load? I suggest the method of trussing each joist with steel rods, but am doubtful as to form of truss, sizes of rods, and best method of fixing same, presuming joists to be all fixed in position. Should you know of a better or easier method than trussing, I should be very glad to know of same."

ROOF TRUSS FOR SPAN OF 80 FT. ANSWER TO ENQUIRY BY H. H. (LONDON N.).

—The calculations already supplied for the barley bins show that for the purlins 18in. by 7in. by 75lb. rolled steel joists are necessary instead of 10in. by 5in. by 30lb., and two 18in. by 7in. by 75lb. bolted together for the valleys, instead of one 12in. by 6in. by 44lb. The difference is so extreme that to suggest that by trussing the latter they can be made to answer their purpose is absurd, and shows a total want of appreciation of the conditions of the case.

HENRY ADAMS.

Strength of Brick Pier.

W. J. S. (SOUTH AFRICA) writes: "I was asked to prepare a design for a store, and was to be paid for preparation only. The proprietor, a draper, was to superintend the building. After tenders were called for, the amount of lowest seemed more than the owner was prepared to spend, and his first act was to confer with the builder sending the lowest tender and knock out everything possible to reduce cost. The reinforced concrete beam was one of the parts described by the builder as unnecessary and useless. The owner came to me saying that Mr. So-and-So says it's not necessary, and why waste his money? My reply was: If Mr. M. says so it must be true (in a sarcastic way), as I had had enough of Mr. M.'s suggestions. To substitute this beam they found it was necessary to put something, so recommended an iron bar from front to back, and under the R.S.J. a stone template 2ft. by 1ft. 3ins. by 6ins. They also added to the load by building on a wooden bressummer 4½in. brick walls; also along the R.S.J. a 4½in. brick wall, 12ft. high, forming three rooms, whereas I understand lath and plaster was to be used. The result is the stone template under R.S.J. fractured, and the pier split from top to bottom. Now to get out of it the builder tries to throw the blame on the 'weak pier' specified. I should like your opinions on my original plan [not reproduced], that I may have some other unbiassed opinion. The reason for the brick pier being adopted was a matter of expense—transport more particularly. The whole scheme has been mutilated by the builder in an attempt at smartness, and this first failure will probably be followed by others."

—The information supplied is not sufficient to determine the actual load on the pier which has failed, but apparently the 12in. by 6in. rolled steel joists could not bring more than 13 tons on the pier. Assuming this load to be uniformly spread over the pier it would give a mean pressure of $\frac{13}{1.125 \times 3} = 3.85$ tons per sq. ft. The pier being in cement should, if large enough, be capable of bearing 6 tons per sq. ft., but being less than one-sixth height in thickness, the safe load would only be $W\left(\frac{24-\frac{h}{12}}{18}\right) = 6\left(\frac{24-\frac{13}{1.125}}{18}\right) = 4.2$ tons per sq.ft. or a total of $4.2 \times 3 \times 1.125 = 14.17$ tons. The conclusion is therefore that the pier was just thick enough, but the case is not stated in a sufficiently definite manner to be quite certain. By Gordon's formula the safe load on the pier would be

$$\frac{6 \times 3 \times 1.125}{1 + \frac{2.5}{1 \times 2500}\left(\frac{13}{1.125}\right)^2}$$

= 17.87 tons, supposing the work to be first-class. HENRY ADAMS.

Roof Truss for Span of 80 Ft.

H.H. (LONDON, N.) writes: "I have to construct an economical slate-covered roof, with curved plaster ceiling of about 80 feet clear span, and enclose sketch (not reproduced) of my idea. The roof is to be supported on steel stanchions, which also carry the front of a gallery, and flat roof over same. Will your expert give me a line diagram of the most suitable truss, and any suggestion for a simple method of carrying a fibrous plaster ceiling between the trusses?"

—For economy in a steel roof truss the struts should be at right angles to the principal rafter, as the stress in them is then greatly reduced. If the ceiling is panelled the ceiling joists may be carried on the tie rods, which will then be covered to form ribs. The diagrams herewith show two methods of framing the trusses, with the stress diagram for each. The stresses have been scaled off and marked upon the frame diagrams in cwts. to facilitate the designing. The maximum for either side should be taken in each case.

HENRY ADAMS.

Right of Light.

M.W. (HARROGATE) writes: "It is proposed to build a one-storey *workshop*, as sketch (not reproduced), abutting on *cottage* and *open yard*. There is a bedroom window as shown. The light of this will be *only obstructed laterally by the gable of new workshop*. The open yard will have the end built up. Is there any question of right of light or air involved? The cottage is the end one of seven, to which the yard is common."

—In answer to "M.W.," the proposed workshop can at best only interfere with the light reaching the cottage bedroom window from a lateral direction. That could not amount to an interference with an ancient light. The House of Lords has held that to constitute an actionable obstruction of ancient lights, it is not enough that the light is less than before. There must be a substantial privation of light, enough to render the occupation of the house uncomfortable, according to the ordinary notions of mankind, and (in the case of business premises) to prevent the plaintiff from carrying on his business as beneficially as before (Colls v. Home and Colonial Stores, 1904, a.c. 179). The test is not: How much light is taken? but: How much is left; and is that enough for the comfortable use and enjoyment of the house, according to the ordinary requirements of mankind? (Higgins v. Betts, 1905, Q.a. 211). B.

Valuer of Real Property.

"VALUER" (BOURNEMOUTH) writes: "(a) What is the proper course to take in order to qualify as a valuer of real property? (b) Are there any examinations, compulsory or otherwise, for such a post? (c) What are the best books on the subject? (d) What are the prospects of this profession, and is the remuneration good?"

—(a) Valuers are usually also auctioneers or estate agents, and it is a common course that a learner should be articled to a firm carrying on such a profession.

(b) The "Surveyors' Institution" and the "Auctioneers' Institute" both hold qualifying examination in the early part of each year; and though at present these examinations are not compulsory, the tendency of the times is to insist on some such qualification as these bodies are able to confer. I advise you to write to each for a syllabus of the examinations. The addresses are: "The Secretary, Surveyors' Institution, 12, Great George Street, Westminster, S.W."; and "The Secretary, Auctioneers' Institute, 34, Russell Square, London, W.C."

(c) There are many books treating of the valuation of real estate, and it is a little difficult to choose amongst them all, but perhaps Professor Curtis's "Valuation of Land and Houses," which is published at the Estates' Gazette Office, at 6s., and Messrs. Cragg and Marchant's "Hints to Young Valuers," published by the Land Agents Record, Ltd., at 20s., are most suitable for your purpose.

(d) The prospects and remuneration are, in common with other professions, entirely dependent upon the character of the business engaged in, and the opportunities and abilities of the candidate—there is nothing wrong with the profession.

At the present moment there appears to be some possibility that the Government will require a large number of valuers to carry out the valuation of the whole country under the provisions of the pending "Finance Bill"—a long and costly process if it is to be done.

F.S.I.

Liability for Defects.

A. J. (LONDON) writes: "Has there been any decision given in the courts relating to bad work or structural defects in a building several years after its completion? In such case, is it the contractor or the architect who is liable? Could you give us the name of any book which treats of, or bears on, this subject?

—There have been many cases in the courts where the liability of builders and contractors for defects appearing after completion has been considered. See, for instance, *Hill v. Featherstonhaugh*, 5 M. and P., 541; *Farnsworth v. Garrard*, 1 Camp., 38. These, however, are old cases. The question of liability for defects is now usually avoided by the retention of some part of the contract money, and a clause making the contractor liable for any defects which appear within a certain time. The insertion of these clauses explains the paucity of modern cases on the subject. An article which appeared in our issue of May 5, 1909, entitled, "Dry-rot and Legal Liability," sets forth the law as to liability of a contractor for dry rot appearing long after completion; and inasmuch as this is generally caused by a defect in construction, the cases referred to in the article probably have a considerable bearing on the matters which are troubling our correspondent. There is one case which was heard in the King's Bench Division before Mr. Justice Grantham and a special jury in October, 1909. It is reported in our columns of October 20th, 1909. There both builder and architect were held liable to make good the damage caused by an outbreak of dry-rot which occurred about two years after completion of the work. With regard to text books, mention may be made of "The Law Affecting Engineers," by W. V. Ball, London; Constable and Co., price 10s. 6d., which contains reference to many cases relating to the subject.

B.

BUILDING FOR ONESELF.

By the courtesy of "The Daily Mirror" we are enabled to reproduce a characteristic cartoon by Mr. W. K. Hazelden on the dangers attending the prospective building-owner. "Everybody is full of suggestions about house-construction nowadays. You may set out hopefully to build a house for yourself, but before you have gone far kind friends and relatives innumerable will stop you and show you what you ought to do. At last, with your head full of contradictory advice and conflicting notions, you will sit down in despair and feel like letting them build it for you." Our contemporary in the same issue publishes a sensible leader on Amateur Architects, "the combined business of builder and architect being one of the principal to be bothered by the incessant interference of the Amateur."

TRADE AND CRAFT.

Light and Strong Partitions.

The development of garden suburbs, the demand for the rapid and economical construction of model villa residences, and the swift multiplication of places of amusement, such as skating rinks, bioscope theatres, etc., not only in and around London, but all over Britain and Europe, have rendered obvious the need for a light partition which can be easily and rapidly constructed, but must also possess sufficient strength to support weights without the interposition of a girder or similar support. Such a partititon should possess the further qualities of solidity and fire-resistance, and be proof against the harbouring of vermin. We recently had the opportunity of examining the partition slab manufactured by The Partition Block Company, of New Cross, which satisfactorily fulfils all these requirements. This firm, which has branches in Liverpool, Glasgow, Edinburgh, etc., claim to supply their partition at the shortest possible notice, either delivering to any part of the country, or, if so desired, sending their men to erect and finish.

The sizes made by them are 29in. × 15in. for 2in., 2½in., and 3in. thick slabs, and 13½in. × 20in. for the 3½in. thick slabs, these dimensions having been found to be those which are most convenient in practice, particularly when, in quick building, it is necessary to run in the joints with grout; which, when the joints are comparatively short, sets satisfactorily, so that the partition forms a solid mass, which is a very essential condition for developing the full strength of the partition. When properly erected the partition can be safely used for external walls owing to the ability to carry weight. They resist all weathers, and are eminently sound-proof.

The slabs are manufactured with special plaster and well-washed breeze, and a chemical composition which is guaranteed to contain nothing harmful or unhealthy, but if possible, adds to the sanitary properties of the slab. The material is therefore very suitable for use in hospitals, sanatoria, etc. No sawdust is used in the composition of the slabs, and therefore they do not rot.

This partition is quite selt-supporting, and does not require uprights, rods, or other supports for erection. It is also very light for a partition, capable of carrying weight, as the following figures will show:—22 super yards of 2in. partition, 1 ton; 18 super yards of 2½in. partition, 1 ton; 16 super yards of 3in. partition, 1 ton.

The blocks are supplied either smooth or keyed, in the latter case affording a very good surface for plastering, and any kind of setting coat may be used, and only one setting coat is required. After erection, openings may be cut, or the slabs may be chased for gas and waterpiping. The partition affords a very good grip for nails and screws. Any kind of tiles may be fixed against the partition with lime putty, Keene's or ordinary cement. For outside walls it is advisable but not necessary to finish with a rough-cast face.

The Partition Block Co., after giving careful consideration and making numerous tests of English manufacture, have found a special plaster of English manufacture giving them the same results as plaster manufactured in Paris, and the firm have specially trained workmen, and a competent expert who tests the plaster of every consignment entering their works, ensuring uniformity for every slab mixed and finished. In fixing, as already stated, no rods, stays, or uprights are required, and a partition 37ft. × 14ft. 6in. high is shown to be perfectly stable without any such supports. For door frames, they advise a grooved door frame which allows about 1in. or 1½in. of the whole slab to go into the groove.

For a recent London building, viz., the new Skating Rink, Maida Vale, this Company's blocks have been extensively used. The same slabs will be used at the stand of Messrs. Davis, Bennet and Co., at the Ideal Home Exhibition, this firm's stand being erected by the Partition Block Co., and hundreds of yards of their partition can be seen set in different materials and covered with a variety of tiles.

The firm's works are at Cold Blow Lane, New Cross, London, S.E.

A New Screwdown Tap.

Mr. Garratt's "Ideal" screwdown tap, a smooth piston, which does not turn, but is actuated by the strong coarse screw of the tap, supersedes the usual screwed spindle and loose "jumper." The "Ideal" piston is raised or lowered quite independently of the water pressure, and is therefore equally applicable to high or low-pressure services, and for hot or cold water. The tap cannot be unscrewed at the wrong place, nor jammed or stripped even by excessive force. The seating is held in an internally flanged ring, instead of having, like the ordinary washer, a central hole and a nut on the under side. The old arrangement is to a certain extent obstructive, and weakens the washer; but the new encased seating cannot be jammed off or forced out by any amount of squeezing. Other advantages—that the taps are unaffected by hard or even gritty water, do not get out of order or drip, and may be used for many years without re-washering—are enumerated in an illustrated pamphlet issued by Garratt's Patent Screwdown Valve Co., 11, Queen Victoria Street, E.C., who show valuable testimonials from Mr. F. A. Legge, A.M.Inst.C.E., of the Metropolitan Water Board, Mr. Wm. Dawson, M.Inst.C.E., the engineer of the Leyton U.D. Council, and others. These taps are in use by H.M. Office of Works and Public Buildings for the Royal Courts of Justice, Somerset House, Victoria and Albert Museum, Admiralty Offices, and elsewhere.

Shallow Box Spring Hinges.

Modern construction of floors leaves, in many instances, only a very shallow space for the fixing of floor springs. In order to meet the consequent requirement, Mr. Robert Adams, 3 and 5, Emerald Street, Holborn, has introduced a box which is sufficiently shallow to occupy a depth of only 1¼ins., and is therefore suitable for almost every floor. Such a shallow box has been long a desideratum, but hitherto it has been thought impossible to provide, within so shallow a recess, a satisfactory check-action spring. The firm, however, have invented a check-action which is guaranteed to be strong enough for any possible requirement. There is, moreover, no oil loose in the box, the checking mechanism (which is of so simple a character as to permit of easy repair), and the viscous composition used for the check being contained in a cylinder, which neither permits it to escape and stain the floor, nor admits of the entrance of water, which might damage the springs. These springs are already in use in some of the largest buildings in the country, and are meeting, we are informed, with the entire approval of the users.

COMING EVENTS.

Wednesday, April 6.

CARPENTERS' HALL LECTURES. — Mr. Thackeray Turner, F.S.A., on "The Craft of Repairing Buildings," 7.30 p.m.

ROYAL SANITARY INSTITUTE.—Dr. A. J. Martin on "Sanitary Aspects of Floods and Measures to be taken to prevent epidemics arising therefrom." 5 p.m. Mr. C. Chambers Smith on "Sewage Disposal." 7 p.m.

INSTITUTE OF SANITARY ENGINEERS.—Mr. A. B. Ogden on "The Cleansing of filtering media and materials for constructional work." 8 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION. Associates' Business Meeting.

Friday, April 8.

ROYAL SANITARY INSTITUTE.—Professor H. R. Kenwood on "Water—Composition, Pollution and Purification." 7 p.m.

INSTITUTION OF CIVIL ENGINEERS.—Students' meeting. Messrs. G. H. Hodson and H. M. Gell on the reconstruction and extension of Egremont Ferry Pier. 8 p.m.

ROYAL SANITARY INSTITUTE.—Provincial Sessional meeting at Plymouth (Western Law Courts, the Guildhall). Mr. J. Paton on "The Removal of Town Filth." Dr. O. Hall on "The relative value of disinfectants in the control of disease." 7.30 p.m.

Saturday, April 9.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Visit to the New Markets and Slaughterhouses, Gorgie.

R.I.B.A.—Publication of names of applicants for candidature. Election on June 6th.

ROYAL SANITARY INSTITUTE.—Provincial sessional meeting at Plymouth. Visits.

Monday, April 11.

ROYAL SANITARY INSTITUTE. — Mr. Percy Griffiths on "Water Supply; Sources of Supply and Distribution." 7 p.m.

ROYAL SOCIETY OF ARTS (Cantor Lectures).—Mr. A. B. Searle's first lecture on "Modern Methods of Brickmaking." 8 p.m.

SURVEYORS' INSTITUTION.—Mr. T. A. Dickson on "The Report of the Royal Commission on the Poor Laws." 8 p.m.

Tuesday, April 12.

R.I.B.A.—Finance Committee meets.

Wednesday, April 13.

ROYAL SANITARY INSTITUTE. — Mr. H. Percy Boulnois on "Scavenging; Disposal of House Refuse." 7 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Annual Business Meeting. President's Valedictory Address. 8 p.m.

Thursday, April 14.

R.I.B.A.—Science Committee meets.

SOCIETY OF ARCHITECTS.—Mr. S. Bylander on "Constructional Steel Work," 8 p.m.

ILLUMINATING ENGINEERING SOCIETY.—Discussion on The Measurement of Light and Illumination will be continued, 8 p.m.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about five days or longer after the date of this issue. Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders. The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the Contract, which requires them to pay the rates of wages current in the district.

BUILDING.

March 29—April 12. **FOREST HALL (Northumberland).**—Erection of a new Council school, to accommodate 370 scholars, at Forest Hall, for the Northumberland Education Committee. Contractors desirous of tendering should forward particulars of name and address to C. Williams, secretary to the Education Committee, The Moothall, Newcastle-on-Tyne, not later than March 29, with a deposit of £2 2s. for specification and bills of quantities. Plans for the work may be inspected at the office of Hope and Tasker ,Architects, Trinity Buildings, New Bridge Street, Newcastle-on-Tyne, and tenders must be forwarded to the Secretary.

April 2-13. **HERNE BAY.**—Construction of a pier pavilion on their new Pier extension at Herne Bay, for the U.D.C. Plans and specifications of the work can be seen and forms of tender obtained by appointment, at the office of the architects, Percy J. Waldram, F.S.I., and Moscrop-Young and Glanfield, 12, Buckingham Street, Charing Cross, W.C. Application for bills of quantities and general conditions should be made to Joseph Jub, clerk, Town Hall, Herne Bay, not later than April 2, accompanied by £1 1s. as a deposit. In the event of a tender being withdrawn, the deposit will be forfeited. Tenders are to be delivered to the Clerk.

April 9—May 3. **DEPTFORD.**—Erection of a branch library on the site in New Cross Road, S.E., for the Corporation, according to the drawings and specification prepared by Castle and Warren, Architects, and to be seen at their offices at Talbot House, Arundel Street, Strand, W.C. Persons intending to tender must send in their names to the Town Clerk so as to be received by him on or before Saturday, April 9, 1910, accompanied by a deposit of £2 2s. Bills of quantities, prepared by Dow, White, and Gee, of 12, Craven Street, Strand, W.C., together with the conditions of contract, will then be forwarded. Tenders must be delivered to the Town Clerk at the Town Hall, New Cross Road, S.E. The contractor will be required to subscribe to the wages clause embodied in the conditions of contract.

April 11. **WITHERNWICK.**—Alterations and additions to the Council School at Withernwick, for the East Riding of Yorkshire C.C. Education Committee. Plans, etc., may be seen, and forms of tender obtained, on application to the Building Surveyor, County Hall, Beverley.

April 11. **CWMAMAN (Aberdeen).**—Erection of two semi-detached villas at Cwmaman, Aberdare, for Mrs. Jones and the trustees of Moriah Aman Chapel. Drawings and specifications may be seen at the office of J. Llewellin Smith, M.S.A., Architect, Aberdare. Tenders to be sent to H. Harris, Esq., Brook Street, Aberaman, Aberdare.

April 11. **SKETTY.**—Erection of a new police-station, for the Glamorgan Quarter Sessions and C.C. Standing Joint Committee. Plans, etc., can be seen, and copies of the bill of quantities and form of tender obtained, at the office of J. Jones Lewis, No. 7, Rutland Street, Swansea, Solicitor, and at Glamorgan C.C. Offices, Westgate Street, Cardiff.

April 11. **ASHCOTT, near Bridgwater.**—Erection of a new Council school, for the County Education Committee. Drawings, specification, and conditions of contract can be seen and further information obtained at the offices of the architects, Cottam and Samson, Bridgwater, from whom bills of quantities can also be obtained. Tenders must be delivered at the County Education Office, Weston-super-Mare.

April 11. **NORTHFIELD.**—Erection of cubicles at their hospital, West Heath, Northfield, for the U.D.C. Plans, etc., prepared by Ambrose W. Cross, A.M.Inst.C.E., of 23, Valentine Road, King's Heath, the Engineer and Surveyor to the Council. Two sets of tenders are required:—(1) Construction of steel glazed sashes; (2) general builder's work. Bills of quantities, etc., may be obtained, and plans, etc., may be seen at the office of the Engineer, on payment of a deposit of £1 1s.

April 11. **CODNOR (Derby).**—Erection of proposed Council school, for the Derbyshire Education Committee, to accommodate 120 infants. Drawings, specification, agreement, etc., may be seen at the office of the architect to the Committee, St. Mary's Gate, Derby. Bill of quantities, specification, conditions of contract, and form of tender can be obtained at the Architect's office upon deposit of £1 1s. Tenders must be delivered to George H. Widdows, A.R.I.B.A., St. Mary's Gate, Derby. The C.C. will require two approved sureties as security for the performance of contract.

April 11. **LINCOLN.**—Construction of a brick and stone tower, 108ft. high to T.W.L., to support a spherical bottomed steel tank, containing over 300,000 gallons of water, and subsidiary works at Westgate, Lincoln, for the Corporation. Drawings may be seen now, and specification, bill of quantities and form of tender obtained at the office of the Engineer, Mr. Neil McK. Barron, Waterworks Engineer, Lincoln upon production of a receipt from the City Accountant for the sum of £5 5s. Tenders, addressed to the Chairman of the Waterworks Committee, to be delivered at the office of W. T. Page, Deputy Town Clerk, Bank Street, Lincoln.

April 11. **YORKSHIRE (East Riding).**—(a) The erection of a teacher's house and alterations to school at South Duffield; (b) for alterations and additions to the Council school at Pocklington; (c) for alterations and additions to the Council school at Withernwick, for the Education Committee of the C.C. Plans and specifications may be seen and forms of tender obtained on application to the building surveyor, County Hall, Beverley. For the convenience of persons desireus of tendering, a copy of the plans and specifications, together with forms of tender, will be deposited at the respective schools. Tenders to be delivered to John Bickersteth, Clerk to the East Riding Education Authority, County Hall, Beverley.

April 11. **WEST HEATH (Northfield).**—Erection of cubicles for isolation purposes at the hospital, situate at West Heath, Northfield, for the U.D.C. in accordance with plans and specifications prepared by Ambrose M. Cross, A.M.I.C.E., of 23, Valentine Road, King's Heath, the Engineer and Surveyor to the Council. Two sets of tenders are required as follows:—(1) Construction of steel glazed sashes; (2) general builder's work. Bills of quantities and forms of tender may be obtained, and plans and specifications may be seen at the office of Ambrose W. Cross as above, on payment of a deposit of £1 1s. Tenders, No. 1 or 2, as the case may be, must be sent to Edwin Docker, Clerk to the Council, 10, Newhall Street, Birmingham.

April 12. **BANBRIDGE.**—Building an addition to Banbridge Technical School, for Banbridge Technical Instruction Committee, according to plans, etc., to be seen at the office of W. W. Larmor, A.Inst.C.E., Banbridge.

April 12. **TIERNASLIGO (Ireland).**—Erection and furnishing of National school buildings at Tiernasligo, County Donegal. Plans and specification can be seen at Londonderry (Victoria) Royal Irish Constabulary Barracks. Tenders must be sent to the Office of Works, Dublin.

April 12. **HAYES (Middlesex).**—Erection and completion of St. Mary's Parish Room, Hayes, Middlesex. Specification and drawings may be seen and forms of tender may be obtained at "Fairfield," High Road, Hayes, Middlesex, upon deposit of £1 1s. Tenders must be delivered at the above address.

April 12. **GILFACH (Glamorgan).**—Erection of new station buildings, goods shed, etc., for the directors of the Great Western Railway. Plans and specification may be seen and forms of tender and bills of quantities obtained at the office of the Engineer at Newport Station. Tenders must be addressed to G. K. Mills, Secretary, Paddington Station, London.

April 12. **SPITALGATE.**—Pulling down ad rebuilding cells with court-room at Spitalgate police-station, for the Standing Joint Committee of the Kesteven C.C. Drawings and specification may be seen and bills of quantities obtained at the office of the County Architect, Jesse Clare, Sleaford, on payment of a deposit of £2 2s. Tenders to be sent to Thos. H. Holdich, Clerk of the County Council, Sleaford.

April 12. **WREXHAM.**—Erection of a telephone exchange, for the Commissioners of H. M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to the Postmaster, Wrexham. Bills of quantities and forms of tender may be obtained at H.M. Office of Works, Storey's Gate, London, S.W., on deposit of £1 1s. Tenders must be addressed to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

April 12. **BACUP.**—Covering in of the River Irwell with masonry and brick arch, for a length of about 300 lineal yards, situate within the borough of Bacup, for the Corporation and the Lancashire C.C. Plans may be seen and copies of the specification and bill of quantities obtained at the County Bridgemaster's Offices, 8, East Cliff, Preston, to whom tenders must be delivered, addressed to the Chairman of the Main Roads and Bridges Committee.

April 12. **BATH.**—Taking down and rebuilding retaining walls and general repairs at the following bridges, for the Somerset C.C.:—(a) Nettle Bridge, at Oakhill, on the main road from Shepton Mallet to Bath; (b) East Chelwood Bridge and West Chelwood Bridge, on the main road from Bath to Weston-super-Mare, near Pensford, Bristol. Specifications and bills of quantities may be obtained from H. T. Chapman, county surveyor, Bath. Separate tenders must be addressed to the County Surveyor, Bath.

April 12. **MIDDLETON ST. GEORGE, ETC. (Durham).**—New Council schools at Middleton St. George, Hartburn and Whitton, alterations and improvements at Usworth Colliery and Littletown Council schools, and Consett cookery centre, for the Durham C.C. Sole tenders are invited. Plans, specifications and general conditions of contract may be seen, and bills of quantities obtained as follows:—Middleton St. George, Harburn and Whitton new schools, at the office of W. Rushworth, Shire Hall, Durham; alterations and improvements at Usworth Colliery, Littletown and Consett cookery centre (plans, specifications and general conditions of contract only), at the office of F. E. Coats, Shire Hall, Durham. Tenders are to be sent to A. J. Dawson, Clerk to the Education Committee, Shire Hall, Durham.

April 13. **DARTFORD.**—(See Painting).

April 13. **MORLEY.**—Erection of weaving shed at Valley Mills, Morley, for the Valley Mills Co. (Ltd.). Plans and specifications may be seen, and quantities obtained of T. A. Buttery, F.I.A.S., Architect, Queen Street, Morley, to whom tenders are to be sent.

April 13. **CHESTERFIELD.**—Construction of a raking floor and other alterations to the Corporation Theatre, Stephenson Memorial Hall, for the Corporation. Plans, etc., may be seen and bills of quantities, etc., obtained on application to the Borough Surveyor's Office, Saltergate, on payment of £1 1s.

April 13. **SOUTHOWRAM (near Halifax).**—Erection of eleven houses at Bank Top, Southowram, near Halifax. Plans, specifications, etc., will lay for inspection, and bills of quantities may be obtained at the office of Lister Coates, A.R.I.B.A., Architect, 10, Central Street, Halifax, from April 6 to 13, when tenders must be delivered.

April 13. **SALISBURY.**—Builders desirous of tendering for the erection of a new isolation hospital at Old Sarum, near Salisbury, Wilts, for the Joint Isolation Hospital Committee, must forward their names to Francis Hodding, Clerk to the Committee, Market House Chambers, Salisbury, together with a deposit of £3 3s., when copies of the bills of quantities will be supplied as soon as ready.

April 13. **SANDOWN (I.W.).**—Erection of a coach-house and certain other additions to outbuildings at the Isolation Hospital, Scotchells Bridge, near Sandown, for the Hospital Board. Plans and specification may be seen and all particulars obtained at the office of the Surveyor, C. Cassell, at Gresham Buildings, High Street, Shanklin. Tenders to be sent to R. Jones, Joint Clerk to the Board, Town Hall, Sandown, I.W.

April 14. **LANCASTER.**—Gas Works.—Erection of a workmen's mess-room at the gas works, for the Corporation. Plans, conditions, and specifications may be seen on application at the office of the Gas Engineer, Lancaster. Tenders to be delivered to T. Cann Hughes, Town Clerk, Town Hall, Lancaster.

April 14. **WEYMOUTH.**—Erection of an elementary school for 270 boys at Weymouth, for the Education Committee, from drawings prepared by Crickmay and Sons, architects, 49, St. Mary Street, Weymouth, and Westminster. Applications should be sent to G. P. Symes, Clerk to the Weymouth and Melcombe Regis Education Committee, 9 and 10, East Street, Weymouth. The applications received will be considered, and bills of quantities will be supplied to a selected number on receipt of a deposit.

April 15. **MOUNT PLEASANT.**—Building of two houses at Mount Pleasant. For plan and specifications apply to Thorne Tree Cottage, Mount Pleasant.

April 25. **WATERLOO-WITH-SEAFORTH.**—Erection of a secondary and technical school in Cambridge Road, Seaforth, for the U.D.C. Plans may be seen and bills of quantities obtained at the office of the County Architect, Henry Littler, No. 16, Ribblesdale Place, Preston, by deposit of £3. Tenders must be delivered to John I. Thompson, Clerk to the Council, Town Hall, Waterloo.

(*Continued on next page.*)

April 15. **BOOTLE.**—Erection and completion of a public elementary Council school, in the South-east district of Bootle, according to plans prepared by Messrs. Medcalf and Medcalf, Architects, of 7, Moorfields, Liverpool, for the Corporation. Plans may be seen at the Borough Engineer's Office, and the bill of quantities may be obtained on application at the office of J. Henry Farmer, Town Clerk, Town Clerk's Office, Bootle, on making a deposit of £2 2s. The firm whose tender may be accepted will be required to enter into a contract containing clauses as to payment of the standard rate of wages and the observance of the recognised hours of labour in the trades engaged in carrying out the contract. Tenders must be delivered at the Town Hall.

April 16. **PHILIPSTOWN (Ireland).**—Erection of a new school at Philipstown, King's County, according to the plan and specification to be seen at the Parochial House, Portarlington. Printed forms of tender may be obtained from the Manager, The Rev. James Bergin, P.P., Philipstown, to whom tenders must be sent.

April 16. **LOWER SANDHURST.**—Enlargement of the Council school at Lower Sandhurst, Berks, by three classrooms, for the Berkshire Education Committee. Send names to the Secretary to the Berkshire Education Committee, Market Place, Reading, before April 2, together with a deposit of £2 2s. for bills of quantities. Plans and form of contract may be seen at the school on and after April 4. Tenders must be delivered at the office of the Education Secretary.

April 16. **ISLINGTON.**—Alterations, etc., at Nos. 61 and 63, Hornsey Rise, N. (Receiving Homes), in accordance with plan, specification, and condition of contract, which may be seen on application to the architect, Howard Goodchild, No. 409, Holloway Road, N., for the Guardians of the Poor of the Parish of St. Mary, Islington. Copy of the specification can be obtained upon deposit of £2. Tenders must be addressed to the Guardians, and delivered to Edwin Davey, Clerk, Guardians' Offices, St. John's Road, Upper Holloway, N.

April 16. **HEYWOOD.**—Erection of an addition to the Heywood Technical School for a picture gallery and museum, for the Education Authority. The plans may be seen and bills of quantities obtained at the office of the Borough Engineer, J. Ainsworth Settle, A.M.I.C.E., Municipal Buildings, Heywood, by payment of a deposit of £2. Contractors tendering must pay their workpeople the standard or trade union rate of wages and observe the trade conditions attached to the various kinds of work covered by the contract. Tenders must be delivered to Geo. G. Bouchier, Town Clerk, Municipal Buildings, Heywood.

April 16. **HEYWOOD.**—Erection of an extension to the Heywood Technical School for day secondary school and other requirements, for the Education Authority. The plans may be seen and bills of quantities obtained at the office of the County Architect, Henry Littler, 16, Ribblesdale Place, Preston, by payment of a deposit of £3. Contractors tendering must pay their workpeople the standard or trade union rate of wages and observe the trade conditions attached to the various kinds of work covered by the contract. Tenders must be delivered to Geo. G. Bouchier, Town Clerk, Municipal Buildings, Heywood.

April 18. **CAMBERWELL.**—Contractors intending to quote for carrying out the construction of a new quay wall for the Borough Council are notified that the time for submitting tenders has been extended until April 18, 1910.

April 18. **OLDCASTLE.**—Repairs to the fireplaces, floors, etc., of the various wards of the Workhouse and Fever Hospital, for the Guardians. Specification, prepared by Michael Grace, jun., the Board's Engineer, can be seen at Union Offices, Oldcastle Workhouse.

April 18. **ERITH (Kent).**—Erection of two additional wards and other extensions to the Erith Sanatorium, Little Heath, Belvedere, for the U.D.C. Bills of quantities, general conditions, and forms of tender may be obtained from Harold Hind, Surveyor, Council Offices, Erith, upon receipt of a deposit of £2 2s. Tenders to be delivered to J. Kennedy Allerton, Clerk, Council Offices, Erith.

April 18. **STRETFORD.**—Erection of a public Elementary School at Gorse Hill, Stretford, for the Education Committee. Plans may be seen and bill of quantities obtained on application to the architect, Frank W. Mee, F.R.I.B.A., 32, Victoria Street, Manchester, on deposit of £2 2s. Only those tenders will be entertained in which the contractor undertakes to proceed with the work with the utmost despatch and complete the same within the time set forth in the general conditions of contract. Tenders to be addressed to the Chairman of the Sites and Buildings Sub-Committee, Council Offices, Old Trafford.

April 18. **SOUTH FARNBOROUGH.**—Completion of the superstructure of the extension to workshops at the Balloon Factory, South Farnborough, in the Aldershot Command, for the Secretary of State for War. Plans, specification, and conditions of contract may be inspected at the office of the Director of Barrack Construction, 80, Pall Mall, London, S.W., on Wednesday, Thursday, and Friday, April 6, 7, and 8. Those desiring to tender and to receive a copy of the bills of quantities must apply to the Director of Barrack Construction not later than Saturday, April 9. The application must be accompanied by a deposit of 10s. Cheques or orders to be made payable to the Assistant Financial Secretary, and crossed "Bank of England for Credit to Army Funds." Tenders must be delivered addressed to the Director of Army Contracts, War Office, Whitehall, London, S.W.

April 19. **CWMGORSE.**—Erection of a Congretional Chapel at Cwmgorse. Plans and specification may be seen with T. Howell, Postmaster, Cwmgorse, or with W. Beddoe Rees, Architect, 3, Dumfries Place, Cardiff, of whom bills of quantities may be obtained.

April 19. **HAZEL GROVE (Stockport).**—Erection of a new public elementary Council school on land in Chapel Street, Hazel Grove, near Stocport, to accommodate 800 children, with housewifery, laundry, and cookery centres, and caretaker's quarters, for the Cheshire Local Education Authority. Plans and specifications may be inspected and quantities obtained from the architect, C. T. Adshead, Leinster Chambers, 4, St. Ann's Square, Manchester, on payment of a deposit of £2 2s., on and after Tuesday, March 29. Tenders to be sent to J. W. Bain, Clerk, School Brow, Romiley, near Stockport.

April 25. **COVE (Southampton).**—Erection of a new Council school for 140 children at Cove. Plans, specifications, and conditions of contract (no quantities) may be seen, and other information obtained, at the office of W. J. Taylor, County Surveyor, The Castle, Winchester, on and after Monday, April 4. A copy of the plans and specification will also be deposited at the existing school at Cove. Tenders are to be delivered to H. Barber, Clerk of the County Council, The Castle, Winchester.

April 29. **LEYTONSTONE.**—Erection of a new county high school for 300 girls, to be erected at Forest Road, Leytonstone, Essex, for the Education Committee, in accordance with plans and specifications prepared by the architect, W. Jacques, A.R.I.B.A., 2, Fen Court, Fenchurch Street, London, E.C., at whose offices the plans and specifications, together with forms of contract, may be seen on any day except Saturday. Builders and contractors wishing to tender must send their names and addresses, together with a deposit of £5, to the Architect, on or before Monday, April 11, 1910. The contractor whose tender is accepted will be required to give the bond of an approved guarantee society in the sum of £1,000 as security for the due performance of the contract. Tenders to be delivered to R. Dempsey, Clerk to the Leyton District Sub-Committee.

No date. **CORK.**—Erection of new chemical and physical laboratories, at University College, for the Governing Body. Quantities may be had on payment of a deposit fee of £1 1s. Plans and all particulars may be had on application to the Architect, Arthur Hill, B.E., F.R.I.B.A., 22, George's Street, Cork.

No date. **HOWDEN.**—Brickwork and plastering of a detached house. Bricks provided. Apply for particulars to W. H. Blackburn, architect, Howden.

ENGINEERING.

April 11. **DISS (Norfolk).**—Sinking a trial borehole, for the U.D.C. Specifications may be obtained from the Engineer, W. H. Booth, Caxton House, Westminster, S.W., on deposit of £2 2s. Tenders to be sent to Henry O. Lyus, clerk, Diss.

April 11. **KINGSBRIDGE (Devon).**—Laying 950 lineal yards or thereabouts of 4in. and 1,300 lineal yards or thereabouts of 3in. water main and other work in connection therewith, for the U.D.C. Plans and specifications can be seen during office hours on application at the office of William Beer, Clerk, Fore Street, Kingsbridge. Tenders to be delivered to the Clerk.

April 11. **AYLESBURY.**—Contracts in connection with new sewage pumping station, Mandeville Road, for the U.D.C.:—(1) Construction of building and tank; (2) supplying and fixing two gas or oil engines, and two pumps to pump 5,000 gallons per hour each, net lift 18ft.; and (3) supplying about 279 yards of 6in. cast-iron socket pipes. Plans and specifications may be seen, and bills of quantities and forms of tender obtained on application to W. H. Taylor, Engineer and Surveyor, Town Town Hall, Aylesbury, upon deposit of £2 2s. Tenders to be delivered at the office of Percy A. Wright, Clerk to the Council, Town Hall, Aylesbury.

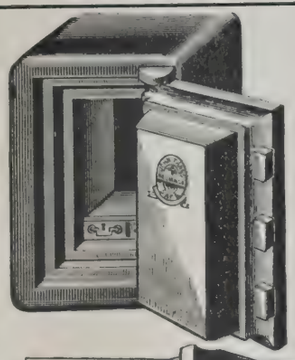
April 11. **PONTEFRACT.**—Execution of a scheme of sewerage and sewage disposal, comprising the laying of about 1,000 yards of main sewers and manholes, relaying of about 1,500 yds. of existing sewers, alterations to precipitation tanks, construction of continuous bacterial and sand filters, effluent pipe, etc., at Cutsyke Sewage Disposal Works, for the R.D.C. Full particulars may be obtained from the engineers, D. Balfour and Son, Civil Engineers, 3, St. Nicholas' Buildings, Newcastle-on-Tyne, to whom applications must be made on or before March 21, and must be accompanied by a cheque for £5. Tenders must be sent to J. Dickon Smith, Clerk, Union Offices, Pontefract.

April 11. **BATH.**—Construction of the first sections of the intercepting sewers, pumping station, internal sewers, and sewage disposal works, for the City of Bath. The works for which tenders are now required are as follows:—Intercepting sewer contract:— These works will comprise about six miles of deep low level main intercepting sewers through the City, consisting chiefly of 36in. to 18in. cast-iron sewers and some stoneware pipe sewers, with manholes and appurtenances; together with five crossings under the River Avon, 2¼ miles of high level iron intercepting sewers, a deep storage tank under the pumping station to hold about 375,000 gallons, small connecting sewers, flush water mains, and various subsidiary works. Sewage disposal contract:— These works will comprise storm-water tanks, six large dortmund settling and precipitation tanks, 16 large bacterial filter beds containing 34,000 cubic yards of filtering material, two circular humus tanks, effluent culvert pipes, carriers, drains, embankments, and various works for the reception of 12,000,000 gallons a day during storms. These works will be constructed on 57 acres of corporation land at Saltford, about five miles from the City. Stone sewers, No. 1 contract:—These works will comprise the replacement of several old stone internal sewers by new brick and pipe sewers, with appurtenant works. Day-work contract:—These works will comprise the laying of several sewers, connections and other work which cannot conveniently be done by ordinary contract. Tenders will be received, especially from local and other builders, for the supply of the various materials and labour enumerated thereon. Conclusion.—Tenders for a number of contracts will be advertised for later on for the construction of the pumping station, two pairs of cottages, disposal buildings, mess rooms, several stone sewer replacements, laying of five miles of pumping main, and other works required when the first contracts are sufficiently advanced to enable these works to be started. The plans may be seen (except on the dates given below) and quantities obtained at the office of the Engineer, W. H. Radford, C.E., Albion Chambers, Nottingham, on deposit of £3 3s. for each of the first two contracts, and £1 1s. for each of the other contracts. The plans will also be on view at the Guildhall, Bath, on March 30 and 31, and April 1. Tenders to be sent to Fredk. D. Wardle, Town Clerk of Bath, Guildhall, Bath.

April 12. **RYDE (I.W.).**—Construction of 900ft. stoneware pipe sewer in the High Park Road, High Park, Ryde, for the St. Helen's U.D.C. Plans and specification can be seen at the office of C. Pursey, Surveyor, Council Offices, Somerset Road, High Park, Ryde, I.W., to whom tenders must be sent.

April 12. **BURY AND RADCLIFFE.**—Widening of Hardy's Gate (County) Bridge, which carries the main road from Bury to Radcliffe, on the border of the county borough of Bury and the township of Radcliffe, Lancashire C.C., the Corporation of Bury, and the U.D.C. of Radcliffe. Plans may be seen and copies of the specification and bill of quantities obtained at the County Bridgemaster's Office, 8, East Cliff, Preston, to whom tenders must be delivered, addressed to the Chairman of the Main Roads and Bridges Committee.

April 12. **DENTON AND HYDE.**—Widening of Broomstair (County) Bridge, situate on the main road from Denton to Hyde, half in the township of Haughton (Lancashire) and half in the borough of Hyde (Cheshire), over the river Tame, for the C.C.'s of Lancashire and Cheshire, the Corporation of Hyde, and the U.D.C. of Denton. Plans may be seen and copies of the specification and bill of quantities obtained at the County Bridgemaster's Office, 8, East Cliff, Preston, to whom tenders must be sent, addressed to the Chairman of the Main Roads and Bridges Committee.



April 13. **BIRMINGHAM.**—Construction of about two miles of 9in. to 21in. stoneware pipe sewers, 200 yards of brick and concrete sewers, 2ft. 3in. and 3ft. in diameter, together with an overflow chamber and manholes in the neighbourhood of Bordesley Green, for the Public Works Committee. Plans and specification may be seen and quantities and forms of tender obtained at the office of Henry E. Stilgoe, City Engineer and Surveyor, The Council House, Birmingham, on deposit of £2. The contractor whose tender is accepted will be required to pay not less than the minimum standard rate of wages current in the district. Tenders addressed to the Chairman of the Public Works Committee, must be sent to the City Engineer at above address.

April 14. **EGYPT.**—Sewage pumping plant, for the Egyptian Government. Copies of the conditions of tender, etc., may be obtained on application from A. L. Webb, C.M.G., Queen Anne's Chambers, Broadway, Westminster, London, S.W., and the Commercial Intelligence Branch of the Board of Trade, London. April 16. **ROCHDALE**—Construction of a covered service reservoir (capacity two million gallons), on land belonging to the Corporation adjacent to Thornham New Road, in the Borough, and about 2¼ and 2 miles respectively from the Rochdale and Castleton railway stations of the Lancashire and Yorkshire Railway, for the Corporation. The drawings may be seen and a copy of the specification and form of tender, with schedule of quantities, may be obtained (on deposit of £5 5s.) at the offices of H. Rofe and Son, Civil Engineers, 8, Victoria Street, Westminster, S.W., and Oxford Chambers, Victoria Square, Leeds. Tenders to be sent to Wm. Henry Hickson, Town Clerk, Town Hall, Rochdale.

April 20. **LITTLEOVER, NEAR DERBY.**—Construction of about five miles of 15in., 12in., 9in., and 6in. pipe sewers, together with manholes, gauge chambers, stormwater overflows, ventilating shafts, and other accessories, for the Shardlow R.D.C. Plans and specification may be seen at the office of the engineers, Shaw, Son, and Fuller, The College, All Saints', Derby, and a form of tender and a copy of bill of quantities may be obtained from them on deposit of £1 1s. Tenders must be sent to J. W. Newbold, Clerk, Becket Street, Derby. The contractor whose tender may be accepted will have to enter into a bond with two bondsmen to ensure his financial ability to carry out the work.

April 20. **ROCHDALE.**—Construction in ferro-concrete of a high level road and coal store in connection with their gasworks, for the Gas and Electricity Committee of the Corporation. Plans and levels of the site may be seen and conditions of tender obtained on application to T. Banbury Ball, the manager, at the Gasworks, Dane Street, Rochdale, from whom any further information may be obtained. Tenders to be addressed to the Chairman of the Gas and Electricity Committee, Town Hall, Rochdale.

April 21. **FISHTOFT.**—Heating the Parochial school by means of the low pressure hot-water system, for the Trustees. The school may be inspected on any week-day on written application to Rev. E. P. Cook, Fishtoft Rectory, Boston, to whom tenders must be sent.

April 21. **LAMBERHURST (Tonbridge).**—Taking up and relaying of about 240 yards of 15in. pipe, and construction of about 400 yards 9in., and 70 yards 6in. stoneware pipe sewer, with 12 manholes, etc., etc., in the village of Lamberhurst, about three miles from Goudhurst Station, for the Tonbridge R.D.C. Plans and specifications may be seen, and bill of quantities and form of tender obtained on application at the office of Frank Harris, Engineer and Surveyor to the Council, Broadway, Southborough, Tunbridge Wells, on deposit of £1 1s. Tenders to be delivered to Neville R. Stone, Clerk to the Council, 23, Church Road, Tunbridge Wells.

April 23. **STROMA.**—Construction of additional works to be executed at Stroma South Pier, for the Caithness C.C. Copies of the plans, etc., may be seen at the office of Mr. James Young, County Clerk, County Clerk's Office, Thurso.

June 1. **MONTE VIDEO (Uruguay).**—H.M. Legation at Monte Video have forwarded copies of the specification, plans, etc., in connection with the invitation, by the Administration of the port of Monte Video, for tenders for the construction of two reinforced cement warehouses and six reinforced cement sheds. Tenders will be received up to 3 p.m. on June 1, at the Oficina de Trafico y Conservacion, Consejo de Administracion del Puerto de Monte Video, Calle Cerrito 185, Monte Video. The above-mentioned copies of specifications, etc., may be seen by British firms at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, London, E.C.

IRON AND STEEL.

April 11. **BOGNOR.**—Supply of 846 angle iron fencing standards, 6 straining pillars, and 16 cwt. four point, galvanised barbed wire, according to sizes and specification, to be obtained from Henry Layton Stafforth, clerk, Council Offices, Bognor, to whom tenders must be sent.

April 11. **LONDON, N.W.**—Supply of about 370 yds. (more or less) of certain wrought iron unclimbable fencing, delivered and fixed complete near their sewage outfall works, Renters Lane, and at the entrance to the Child's Hill Recreation Ground, from the end of Granville Road, Child's Hill, N.W., for the Hendon U.D.C. Specifications and forms of tender may be obtained on application to S. Slater Grimley, Engineer and Surveyor, Council Offices, The Burroughs, Hendon, N.W. Tenders, addressed to the Chairman of the Council, to be sent to Henry Humphris, Clerk to the Council.

PAINTING.

April 11. **ESTON.**—Repainting and repairs to the Congregational Church. Specifications, etc., at the church from 3.30 to 5.30 p.m. on the afternoons of April 4, 5, and 6.

Prescott, manager of the Drainage Department, between the hours of 9 and 11 o'clock each morning. Tenders must be addressed to the Chairman of the Drainage, etc., Sub-Committee, and delivered at the Drainage Office, Town Hall, Manchester.

ROADS AND CARTAGE.

April 11. **WEST SUFFOLK.**—Supply of granite for the main roads, for the C.C. Specification and form of tender can be obtained on application to A. Ainsworth Hunt, County Surveyor, Shire Hall, Bury St. Edmund's.

April 11. **LANCASHIRE.**—Supply of about 10,000 tons of granite macadam, to be delivered at various railway stations in the county. Forms of tender and particulars can be obtained on application to W. H. Schofield, County Surveyor, County Offices, Preston, to whom tenders must be delivered.

April 11. **WOOLWICH.**—Supply of 300 tons of Guernsey granite spalls for breaking, for the Union. Letters, stating price per ton, to include delivery at the Union Workhouse, Plumstead, to be sent to Tom Cutter, Clerk to the Guardians, Clerk's Office, Workhouse, Plumstead. A sample spall must be sent to the Workhouse, Plumstead, by April 11.

April 11. **WANDSWORTH.** — Making up and paving of that part of Copley Park, Streatham, which lies between Streatham Common South and Heybridge Avenue, for the Borough Council. The specification and drawings may be seen, and forms of tenders obtained at No. 56, East Hill, Wandsworth, S.W., upon payment of a deposit of £5 5s. Tenders must be delivered at the Council House, East Hill, Wandsworth, S.W., and may be placed by the person tendering in the box provided for the purpose. Persons tendering must in the case of all workmen employed by them pay wages at no less and observe hours of labour not greater than the rates and hours recognised by the associations of employers and employees and in practice obtained in the district where the work is to be executed.

April 11. **BRIGHOUSE.**—Repaving of a portion of Birds Royd Lane with granite setts on concrete (the setts to be provided by the Corporation). Plans and sections may be seen, and specification and bills of quantities obtained upon application to S. S. Haywood, Borough Engineer and Surveyor, Municipal Offices, Brighouse. Tenders, accompanied by the priced bill of quantities, to be sent or delivered to Jas. H. Rothwell, Town Clerk, Town Clerk's Office, Municipal Offices, Brighouse.

April 11. **BECKENHAM.**—Making-up of Faversham and Shaftesbury Roads, for the U.D.C. The works comprise the following:—130 cubic yards, flint, 1900 lin. ft. second-hand channelling, 735 super. yds., Burgess Hill paving (bricks supplied), together with the remodelling of about 1,500 super. yds. of roadway. Plans and sections may be seen, and bills of quantities, specifications, and forms of tender obtained, on application to John A. Angell, Surveyor, on the production of a receipt from the collector (who attends his office daily from nine to ten a.m. only, except on Tuesdays, when his hours are from nine a.m. to one p.m.), for a deposit of £2. A clause will be inserted in the contract providing that the contractor shall (1) pay to the employees the wages generally accepted as current for workmen engaged on similar work in the town where the work is executed, and (2) to the extent of 75 per cent. at least of the staff required in the execution of such works give preference to and engage such competent workmen of the class required as may be bona-fide residents in the parish of Beckenham, and may offer themselves for employment. Payment under the contract will not be made until six months after the completion of the works. Tenders to be sent to F. Stevens, Clerk to the Council.

April 12. **FAVERSHAM (Kent).**—Supply of hand-picked surface flints, for the R.D.C. Full particulars, the terms of the contract, and form of tender may be had on application to J. E. Chittenden, District Surveyor, Ashford Road, Faversham. Tenders, addressed to the Council, to be delivered at the office of Guy Tassell, Clerk, Faversham.

April 12. **TIPTON.**—Supply of stoneware drain pipes from 6in. to 30in. diameter, as may be required for the U.D.C. Copy of the specification, form of tender, and conditions may be obtained on application to the undersigned, upon £1 deposit. Tenders to be delivered to Wm. H. Jukes, M.E., Engineer and Surveyor, Surveyor's Offices, Public Offices, Tipton.

April 12. **NEW MALDEN (Surrey).**—No. 1, making up the carriage-way, kerbing, channelling, etc., and other works in Albany Road, New Malden; and No. 2, paving with artificial stone slabs the footways of Albany Road, New Malden, for the Maldens and Coombe U.D.C. The drawings may be seen, and conditions of contract, specifications, schedules, and forms of tender obtained on application to the Engineer and Surveyor, Reginald H. Jeffes, A.M.I.C.E., Council Offices, New Malden, upon payment of a deposit of £4 4s. for Contract No. 1, and £2 2s. for Contract No. 2, which in each case shall be by cheque payable to the Council. Tenders to be addressed to the clerk to the Council.

April 12. **COLWYN BAY.**—Making up of the private street known as Coed Coch Road (part of), Colwyn, for the U.D.C. Plans and specifications may be seen and bills of quantities obtained upon application to the Surveyor at the Council Offices, Colwyn Bay. Tenders to be delivered to James Amphlet, Clerk to the Council, Council Offices, Colwyn Bay.

April 12. **MARGATE.**—Excavating and carting away the chalk, earth, and other material at the Corporation's Low Service Reservoir in rear of Milton Road, and depositing the same at the back of the new sea wall now in course of construction in front of the Fort Green. The quantity to be removed is about ten thousand cubic yards. The work to be carried out to the satisfaction of the Borough Engineer, Ernest A. Borg, the material to be deposited as directed, and the whole of the carting to be completed within a period of three months. Further particulars can be obtained on application at the Borough Surveyor's Office, 13, Grosvenor Place, Margate. Tenders must be sent to Edward Brooke, Town Clerk, Town Clerk's Office, Margate.

April 12. **FAVERSHAM.**—Supply and delivery of 1,060 tons of best Guernsey granite broken to a 2in. gauge and well screened, to be delivered free alongside Faversham Town Wharf, 600 tons; free alongside Conyer Wharf, Toynham, 200 tons; and in trucks at Selling Station, S.E. and C.R., 260 tons; 40 tons of chippings, 1in. gauge, free alongside Faversham Town Wharf. The materials to be delivered at such times and in such quantities as the Surveyor shall direct, between date of acceptance of tender and Nov. 1, 1910, for the R.D.C. A written order for delivery to be executed within 21 days of the receipt of order. Forms of tender and further particulars can be had on application to the District Surveyor, J. G. Chittenden, Ashford Road, Faversham. Tenders to be delivered at the office of Guy Tassell, Clerk, Council Offices, Faversham. Samples of materials to be sent to the Surveyor by April 11.

April 13. **CHELSEA.**—Supply of York paving during the period ending March 31, 1911, for the Borough Council. Forms of tender and information respecting the contract may be obtained from T. W. E. Higgens, Borough Surveyor, between 10 and 12 daily, at the Town Hall. Tenders must be placed in the box provided for that purpose, in the office of T. Holland, Town Clerk, Town Hall, King's Road, S.W.

April 14. **HOUGHTON-LE-SPRING.**—Supplying machine broken blastfurnace slag road metal, slag riddlings and blue limestone for asphalting, for the R.D.C. Full particulars as to quantity, quality, dimensions, and places and times of delivery, with forms of tender, may be obtained from the Surveyor of the Council, D. Balfour, M.Inst.C.E., Houghton-le-Spring, S.O. Tenders must be addressed to the Chairman of the Highways Committee, Rural District Council Offices, Houghton-le-Spring, S.O.

April 14. **WESTMINSTER.**—Paving work within the jurisdiction of the City Council. Conditions of contract, specification, schedule, and tender can be obtained on application at the Town Clerk's Office, Westminster City Hall, Charing Cross Road, W.C. The contractors will be bound by the contract in the case of all workmen employed by them, to pay wages at rates not less and observe hours of labour not greater than the rates and hours recognised by the Associations of Employers and Employees, and in practice obtained in the district where the work is to be executed. The contractors are prohibited from directly or indirectly canvassing members or officials of the Council in reference to any tender, and the tender of any contractor who does so canvass will be rejected. The contract deeds will be prepared at the expense of the Council, and the contractors will be required, together with two sureties, to enter into bonds for the due fulfilment of their contracts, or, in the alternative, to agree to the retention by the Council, during the period mentioned in the form of tender, of certain moneys. Each tender to be addressed to "The Town Clerk, Westminster City Hall, Charing Cross Road, W.C." Tenders may be placed by, or on behalf of, tenderers in a locked box at the City Hall, provided for the purpose.

April 15. **FRODINGHAM.**—Supply of about 1,000 tons of whinstone, to be delivered at Gunness and Frodingham Stations, G.C.R., for the U.D.C. Specifications and forms of tender may be had on application to Joe Green, surveyor, Council Offices, New Frodingham, Scunthorpe, Lincolnshire, to whom tenders must be sent.

April 15. **PREESALL-WITH-HACKINSALL.**—Supply and delivery of materials for a period of 12 months ending March 31, 1911: — 1, limestone, granite, and slag macadam; 2, tarred macadam; 3, kerb stones, setts, and channel stones; 4, stoneware pipes, gullies, etc.; 5, Portland cement; 7, hired carting; 8, road rolling and machined stone breaking; for the U.D.C. Further particulars and forms of tender may be obtained by application, accompanied by a stamped addressed foolscap envelope, to the Council's Surveyor, Francis E. Boaz, A.M.I.S.E. Tenders to be sent to Jos. Cumming, Clerk to the Council, Council Offices, Preesall, Poulton-le-Fylde.

April 16. **RUSKINGTON (Lincs.).**—Supply of granite, slag, and ironstone to Ruskington Station (carriage free) during the season, for the U.D.C. Forms of tender may be had on application to Ernest H. Godson, Clerk, Sleaford. Tenders, with samples, stating price per ton, to be sent to the Clerk, Council Chambers, Ruskington.

April 16. **HAMILTON (Scotland).**—Executing the works of granolithic paving kerb, and channel and causeway crossings in the parishes of Blantyre, Bothwell, Cambuslang, Cambusnethan, Dalserf, Dalziel, and Hamilton, for the District Committee of the Middle Ward of the County of Lanark. Specifications may be obtained on application to Robert Spittal, Road Surveyor, District Offices, Hamilton, and tenders must be lodged with W. E. Whyte, District Clerk, Hamilton.

April 18. **LITHERLAND.**—Widening and improving of Sefton Street for the U.D.C. Plans and specification can be seen and form of tender and quantities obtained on application to A. H. Carter, Surveyor, Public Offices, Sefton Road, Litherland, any morning between the hours of 9 and 11 o'clock, on deposit of 10s. 6d. Tenders to be sent to William Kirk, J. W. Allen North, Clerks to the Council, 15, Lord Street, Liverpool.

MISCELLANEOUS.

April 11. **NEW MALDEN.**—Supply of 120 fathoms of best Swedish board ends, first quality, square edge, to be delivered at the Norbiton Common Farm, Kingston Road, New Malden, as and when required, for the Kingston Guardians. Tenders must be sent to Chas. W. Dash, Clerk to the Guardians, Union Offices, Coombe Road, Kingston-on-Thames. The Guardians do not issue forms of tender for the supply of this wood.

April 13. **DUNSTON (Brentwood).**—Supply of builder's materials for immediate delivery to Laindon Siding, L.T. and S. Rly., for the Branch Workhouse, Sumpners Farm, Dunton, nr. Brentwood, Essex, for the Poplar Board of Guardians. Form of tender, containing full particulars of contract, may be obtained by personal application at the office of G. Herbert Lough, clerk to the Guardians, Guardians' Offices, 45, Upper North Street, Poplar, E., or on request will be forwarded by post. Tenders must be sent to the clerk at this address.

April 20. **HORSHAM.**—Tar paving of the playgrounds and incidental work at the Horsham Southwater Council school, for the West Sussex Local Education Authority, situate about three miles from Horsham and within half a mile of the Southwater Railway Station (L.B. and S.C.R.). Specifications and forms of tender will be forwarded on application to Lionel Thompson, Secretary, Education Offices, Horsham, Sussex, to whom tenders must be sent.

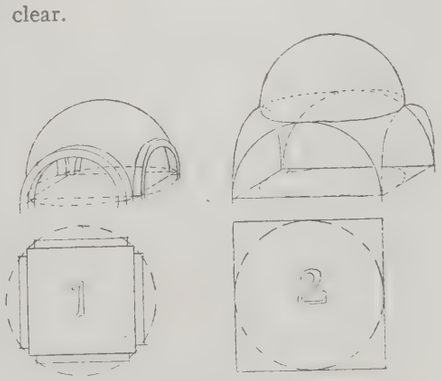
APRIL 13, 1910. *CAXTON HOUSE, WESTMINSTER.* VOLUME 31. No. 793

Note: The List of Contents will be found on Page V of the front advertisments in this and subsequent issues.



A Paradox in Architectural History.

IN our last issue we endeavoured to combat the idea that seems to have taken hold of some people's minds, that there was no value in books and writings on architecture, and pointed out some uses of books, the value of some special books, and the possible usefulness also of the more ephemeral form of journalistic writing. And now there comes a book—large, learned, and profusely illustrated—which seems calculated to cut both ways; a book full of information, containing an immense array of illustrations, in many cases of little-known buildings, and obviously the outcome of a quite unusual degree of study and observation of buildings at first hand; and yet all this learning is directed towards proving a paradox—recommending what appears to us to be a falsification of a great chapter in the history of architecture.

This work of Signor Rivoira's, which now comes to us in an English translation,* is entitled "Lombardic Architecture," and seems at first sight a very large book to be devoted to what we have generally regarded as a local school of architecture. But it appears that what the author calls "Lombardic architecture" means what has generally been understood as "Romanesque architecture," a word having a far wider meaning, and that his thesis is that the architecture of Lombardy was the centre from which sprung the whole of mediæval architecture; that (in the second volume, which treats of the "derivatives" of Lombardic architecture) such buildings as Rheims, Lincoln, Norwich, Oxford Cathedral, etc., are to be grouped under the title "Lombardic"; in fact, that the centre of Gothic architecture is to be shifted to Lombardy. But this is not all; the book commences with Byzantine architecture; and this also is to be regarded as entirely derived from Italy. In short, Signor Rivoira seems to be an enthusiastic Italian student of architecture, who is determined to find that his native soil is the birthplace of all architecture worth speaking of since the Christian era.

The question whether Byzantine architecture owed its origin to Roman or to Eastern influences has been debated before now, and other writers have affirmed that St. Sophia was the outcome of the Roman examples in domical structure. But such a conclusion ignores entirely the essential structural difference between the Roman dome and the Byzantine dome. With the Romans the dome was an obvious manner of roofing in a circular plan. There is not an example of a Roman dome erected over a square plan; to accomplish that, on a large scale, was the special triumph of the architects of St. Sophia, and Rome gave them no hint for it. And Byzantine detail speaks for itself; there is not a hint of anything Roman about it. It may rather be described as Greek detail modified by Asiatic influence and taste; that is the story which its internal evidence tells us. But Signor Rivoira goes further than the Romanisers of Byzantine style. He is determined that San Vitale at Ravenna was the origin of St. Sergius and St. Sophia. It has been generally considered that St. Sergius, as a small church with a low dome lighted at the base, was a kind of precursor of the greater effect of St. Sophia; and that after the latter was built, with its beautiful and characteristic detail, San Vitale at Ravenna, when that city had some under the rule of Justinian in 540, was the outcome of the great architectural triumph at Constantinople, repeating to some extent the plan of St. Sergius, and the detail of St. Sophia. But Signor Rivoira will have none of this. On the basis of a sentence of very doubtful meaning in an ancient Latin chronicle, he will have it that San Vitale was founded in 426, before St. Sergius, and that the latter was an imitation of San Vitale. On this point he is so determined that he never mentions San Vitale without adding in brackets "(A.D. 426)." And so, as the result, San Vitale is the precursor of St. Sophia. No manipulation of dates can make one believe that. It is the tail wagging the dog.

The author will not even give Anthemius the merits of his great pendentive construction. No; the pendentives, too, came from Ravenna, from the tomb of Galla Placidia. Now to say that is to assimilate two constructions which are essentially different. Galla Placidia is merely an imperfect dome cut into by four vertical arches, which leave the intermediate slices of the dome coming down into the angles of the apartment. Those are not pendentives in the true sense. Anthemius's pendentives are portions of a dome whose diameter is the *diagonal* of the square over which it was built, carrying a complete dome whose diameter is the *width* of the compartment, within the confines of which it is inscribed. The annexed small diagrams ought to make the difference clear.

No. 1 represents the Galla Placidia type, in which an incomplete domed surface is squeezed between vertical arches; No. 2 is the Byzantine type of complete dome on pendentives.

For the thesis which includes all Romanesque work, or what we have been accustomed to call so, as "Lombardic,"

*Lombardic Architecture: its origin, development, and derivatives. By G. T. Rivoira. Translated by G. McN. Rushworth, M.A. With over eight hundred illustrations. London: W. Heinemann, 1910.

there is more to be said. The round-arched vaulted basilica, with its thin strips of quasi-buttresses, was evolved first in Lombardy, and there is sufficient resemblance to this in the Rhenish Romanesque to excuse the title "Lombard-Rhenish." But we refuse to accept "Lombard-Norman," or to regard Mont St. Michel or Jumièges as in any sense Lombardic in style. It is true that there are superficial resemblances in exterior work; in the flat buttresses (wider, however, in Norman than in true Lombard architecture) and the small round-headed windows. But the difference is one of general style, and of possibilities of development. In the buildings on Italian soil there never was any power of development into the appearance of growth of one part from another, which is the essential quality of Gothic. Italian architecture, even when it developed into pointed Gothic, was under the dominion more or less of Classic tradition, and always preserved a certain horizontality of character, as of one storey placed upon another. Compare two of the illustrations in this book, the interior of San Miniato and the ruined interior of Jumièges. They do not differ much in date; the author gives "San Miniato 1013—1062," and "Jumièges 1040—1066." But San Miniato is in its general character a Classic interior, while at Jumièges there are all the makings of Gothic already obvious. The difference lay in the architectural genius of France, which was totally different from that of Italy.

This book is, in short, one huge paradox; but as long as the reader keeps clear of being led away by that, it is in its way a splendid production, giving hundreds of comparative illustrations of buildings of a period when mediæval architecture was in the making; illustrations which one does not often find combined in one publication, and some of which are of buildings little known and illustrated; and as they are nearly all from photographs, there is no question as to their accuracy. The author has, we gather, visited every building himself; a conscientious method of study which inspires one with respect for himself and envy of his opportunities. He would have produced a still finer work if he could have been content to deduce his theory from facts, instead of setting out to make the facts fit into a preconceived theory, which was to make Italy the centre and cradle of Gothic architecture.

The "Licentiate R.I.B.A."

WE have received from the Secretary of the Royal Institute of British Architects a copy of a letter which has been sent to the Presidents of the Allied Societies on the subject of the new "Licentiate" class which, under the new Charter, is to be formed in connection with the Institute.

The letter is as follows:—

DEAR SIR,—We have the honour to invite the attention of your society to an important development in the constitution of the Royal Institute of British Architects which has lately been sanctioned by the grant of a Supplemental Charter and new by-laws by His Majesty the King and the Privy Council.

A new class of members, having the chartered right to the designation of Licentiates of the R.I.B.A., has been created. This class is open to all practising architects of good standing who have attained the age of 30 years and either (a) have been engaged as principals for at least five successive years in the practice of architecture, or (b) have been engaged for at least ten successive years in the practice or the study of architecture.

Candidates for this class are not required to pass an examination or to submit to election by the general body, but must satisfy the Council of the Royal Institute that they are fit and proper persons to be admitted to this class.

Under the provisions of the Supplemental Charter of 1908 *candidates for the class of Licentiates will only be admitted during the twelve months from March 23rd,* 1910, *to March 23rd,* 1911.

Under His Majesty's Charter any Licentiate who is eligible as a Fellow may at any time before December 31st, 1920, be admitted for nomination to the class of Fellows when he has passed an examination to be prescribed by the Council.

Licentiates will be required to make an annual payment of one guinea to the Royal Institute, and for this they will be entitled (1) to use the affix Licentiate R.I.B.A., (2) to receive the "Journal," the "Kalendar," and other publications of the Royal Institute, (3) to use the Institute premises, and (4), subject to the Charter and by-laws, to attend the meetings of the Royal Institute.

In view of the necessity of closer organisation of the members of the architectural profession throughout the Empire, both for the advancement of the art of architecture and for the promotion of the interests of the profession by means of Parliamentary or other action, it is highly desirable that a knowledge of this new means of becoming associated with the work of the Royal Institute should be spread as widely as possible among those architects who are at present outside its walls.

Any action which may be taken in the future to secure a higher standard of professional attainment and a greater security for properly qualified architects can only be successful if it is based upon the support of a substantial majority of the practising architects of the Empire, and the Council of the Royal Institute hope that your society will do all in its power to assist the efforts that are now being made to obtain this support.

We have pleasure in sending you herewith a packet of nomination papers for Licentiates, and we shall be glad if you will take an early opportunity of making an official announcement and of taking effective steps by sending by post to all the architects in your province a notice of the creation of this class, drawing special attention to the fact that it is only open for twelve months, and informing them that the above papers are in your hands and may be obtained on application at the offices of your society.

We feel that it is the duty of the Institute and its allied societies to get into touch with all architects in the Empire, and we are sure we may count on your zealous personal assistance to this end.

This new class created under the Charter has of course been much canvassed and criticised, especially on the ground that it amounts to inviting architects who are in practice to join the Institute in what seems a kind of inferior position to that of the Fellows and Associates.

But the matter should be considered, not in a merely self-regarding spirit, but in view of the general good of the profession. The argument seems to stand thus: There are many reputable architects who have been some time in practice, and who, it is thought, could not reasonably be asked to go through an examination for entrance, in view of their present professional position. But in order that the Institute should be able to act effectually in the interests of the profession generally, it is essential that it should represent the general body of architects more completely than it does at present; and the general acceptance of licentiateship by practising architects who are not at present members of the Institute would greatly strengthen the hands of the Council in this respect, and enable it to act as and for the whole profession. We would therefore appeal to architects who are not members of the Institute to accept this offer of the Licentiateship, by which they will certainly gain something for themselves, and assist the interests of the whole profession. That is, we think, the right way to look at it; and in that light the scheme deserves success. The Institute could thus claim to represent the whole architectural profession, and not merely a section of it.

Flowers and Architecture.

THE writer who defined dirt as matter in the wrong place is paralleled by a leader-writer in the "Times," who defines the term weed as a bad name for a plant that we do not want, and in a discourse on "Weeds and Ugliness" draws an amusing analogy between flowers and architecture, comparing the old cottage garden flowers to Gothic, and the extreme formalism of the geranium bed to Classic. And the cause of all this ingenious fulmination is the antagonism to dandelions of the average gardener, who cannot see beauty in them because his conventional ideas will not permit him to "see beauty that is not part of his own design." The dandelion is a "weed"—a word of reproach—just as at one time "Gothic" was a word of reproach, signifying the production of an ugly and a barbaric era; while "Classic" was the product of a great age of civilisation, and therefore assumed to be beautiful. "The power of association perverted the eye of the critic." And when "Gothic," with the swing of the pendulum, came again into favour, "when"—as our critic puts it—"the beauty of Gothic was discovered, the same mistake was made all over again." The works of the Gothic revival "were admired, not because they were beautiful, but because they were Gothic." This is rather less than the truth. The Gothic revival was carried on the tide

of the Oxford Movement; and it was the association of Gothic as the *Christian* style in the public mind, in contradistinction to the Classic or *pagan* style, that established for it a veneration in the hearts of a generation that had been stirred to an aspiration for piety. Even in recent years the Liverpool Cathedral competition made known the fact that there are some who still regard 13th Century Gothic as the only possible style for a church. We fear that the dandelion cannot ride into favour on the mount of a false analogy. It is not until the decline of Gothic, and the early dawn of the Renaissance, till the days of the Elizabethan poets and Bacon the essayist, that we begin to hear of the well-ordered garden. The Jacobeans endowed us with our formal parterres; the Eighteenth Century with the delightful Georgian houses and walled gardens; and it was our grandfathers and great-grandfathers of the neo-Classic period who delighted in the straggling borders of "old-fashioned gardens, as opposed to the formal beds, geranium cult, wriggling paths, and Paxtonian landscapes that marked the height of the Gothic revival in the middle of the 19th Century. It is our modern architects who, reverting to the Georgian Domestic tradition, have revived moderate formalism, herbaceous borders, the rock and wall gardens, and other delights of horticulture. We fancy the geranium cult is more easily explainable by the rise from obscurity of the merchant princes, whose taste in matters horticultural was, generally speaking, that of their gardeners. The love of strong, showy colours, particularly red, is fairly characteristic of the imperfectly educated mind, and probably the somewhat crude taste of both master and man found in formal beds of geraniums the satisfaction which it needed, and of which it could hardly be surfeited.

The Perfection of Imperfection.

A VERY cursory study of Art will quickly reveal how much the final effect of a great work is gained through its imperfections. In a recent issue we published some remarks of Mr. Armitage criticising the extraordinary technique of the modern wood-carver, which makes one feel, he says, "that the grain of the wood spoils the effect, or, to put it in another way, one feels that the work would look better in a perfectly homogeneous substance, such as cheese." If we follow Mr. Heaton we find that Gothic glass obtains a beauty through its manifest imperfection. It is the old cry for Ruskin's "pleasing roughness," which we may assume is the satisfaction of our imperfect vision. One would suppose that if a man planes a board, the more nearly he attains to mathematical accuracy in its final dimensions the more satisfactory will be his work. Yet the advantage his handiwork retains over the mechanical saw and the steam plane is just the very inaccuracy which the human effort cannot overcome. The old Greeks curved the lines of the Parthenon to meet the visual defects of its beholders. If we are to believe Mr. Goodyear, the Mediævalists were not behindhand in securing effect by deliberate inexactitudes in the setting out and construction of their buildings. We see the same feeling in many other directions. The increasing demand for handwork, the love of "hammer-marks," the request for play in colour, for rough surfaces in materials, for the individual notes in drawings, for character in handwriting, are all indications of it.

Machine-made work gains in esteem with the public in proportion as, by clever jugglery, it simulates the inexactness of handwork. And from this we may judge that mathematical accuracy is repellent to the human sense, and that perfection in form is only attained by the imperfection which is inseparable from the work of human hands. But it must be real and unconscious imperfection; simulated imperfection, unfortunately not unknown, is a gross travesty of Art, usually betrayed by its innate self-consciousness. But with the extraordinarily brilliant technique of the present day the whole question threatens to become one of increasing complexity as time goes on.

Garage Design.

ARCHITECTS in the United States, as well as in our own country, appear at length to have made up their minds that the design of the motor garage is worth special consideration. The public or commercial garage is of course a thing apart, and, generally speaking, it is loathly to look upon; but the private garage must harmonise with the dwelling to which it belongs. In many instances it is merely a converted stable; but where it is a specially constructed building, the architect, after making due provision for the requirements of sheer utility, has a free hand as to the design. He has therefore a splendid opportunity of originating something that is comely and appropriate. Is he making the best of it? Hitherto he has proceeded tentatively, as one who, so to speak, has not yet fully inhaled the fine fragrance of the motor spirit, and the result is so characterless that on beholding his building when its doors are closed, one would not feel quite sure whether, if they were thrown open, a horse or a motor would emerge from them—that is, unless one's sense of smell is rather keen, when, in either case, the characteristic odour might settle the temporary doubt. But surely either building should present other strongly characteristic features besides the odour. As for labelling a building with legible lettering, "GARAGE," that may serve the turn of the tradesman, or tickle the vanity of the proud private owner; but in the latter instance it is a sorry expedient, which ought to be rendered entirely superfluous by investing the design of the building with some architecturally distinctive character. But before the general type or series of types can be fixed, it will be necessary to have the means of assembling and comparing the more or less tentative designs that are now rapidly accumulating.

St. Bartholomew-the-Great.

THE announcement of a concert for which the Duke of Sutherland lent the use of Stafford House, the object being the liquidation of the debt on the restoration fund of the Church of St. Bartholomew-the-Great, West Smithfield, has been the occasion of several newspaper articles recalling the interesting history of the old church; concerning which one of the writers nevertheless declares that "there are comparatively few Londoners who know enough about the church, one of the most ancient and noble in England, to care about preserving it from decay." The priory church, as most of our readers are aware, has passed through extraordinary vicissitudes. The original building was erected by Rahere, a Canon of St. Paul's, and a favourite at the Court of King Henry I. His tomb, richly carved and gaudily coloured, is conspicuous on the north side of the sanctuary. Henry VIII. sold the monastic buildings to Sir Richard Rich, who pulled down the nave and converted the Lady Chapel into a dwelling-house. The brick-turreted tower was built in the seventeenth century, when the fifteenth-century crypt was used as a coal-cellar. In the eighteenth century a Nonconformist school was established in the triforium; in the nineteenth century there was a fringe factory in the Lady Chapel, and a smithy in the north transept. In 1863 the Rev. J. Abbis began to set the house in order; the late Sir Borradaile Savory, with the help of Sir Aston Webb, brought the work very near completion; all that remains to be done, or, rather, all that it is now thought practicable to do, being the restoration of the Early English gateway forming the entrance to the churchyard. There should be no difficulty in raising the £300 or so still required to complete the work; for even those who have no feeling for antiquity should be touched to sympathy by the story of the courage, determination, and ultimate triumph of the successive enthusiasts whose indomitable perseverance—sometimes against almost hopeless odds—has restored to something like its pristine state this very interesting relic of mediævalism.

St. George's Hall, Liverpool.

FROM a rough illustration in the Liverpool *Daily Post* we get an idea of a proposal by Professor S. D. Adshead for a new treatment of the open space of ground at the back of St. George's Hall. The history of this piece of ground is curious. It was the site formerly of an old eighteenth century church, which stood at an oblique angle to St. George's Hall, and was rather an eyesore. This was removed with the intention of making the ground the site for the Liverpool Cathedral, and the designs in the first competition for the cathedral, a good many years ago, were made for this site, which was somewhat confined for the purpose, and had an effect on the designs, in inducing short and compact plans. It would, however, have been a grand site for the cathedral, the west front of which would in that case have stood boldly at the top of a steep slope. When the first cathedral scheme was abandoned, the ground was left in disorder, and subsequently treated as a kind of public garden in a rather crude manner. Mr. Adshead proposes to have it laid out now in a more spacious and formal manner, and with direct relation to St. George's Hall. The upper part, next the hall, is to be a terrace, with a continuous flight of steps parallel with the Hall, and from the ends of this are to branch two semicircular terraces, with steps down at intervals, embracing between them the rest of the open space, in which are to be two fountains. The upper terrace, next the hall, is shown with a statue on a pedestal as a central object, and a small circular columned temple (one may call it) near each end. The object of, or the excuse for, these is that the back elevation of the end wings of the Hall is rather uninteresting, as in the original state of the ground Elmes did not suppose it would be much seen, and it is considered that it would bear being masked a little by some decorative erection in front of it. There is something in this, though we cannot agree that if Elmes had foreseen the clearing of this site he would have placed the front of St. George's Hall towards it instead of the back. He could not have *backed* the Hall and the main street and principal railway station; but he might have thought it worth while to treat both sides as of equal importance. Mr. Adshead's scheme, as far as we can judge from the rough illustration alluded to, seems a fine one, and will be a public improvement worth carrying out.

New French Building Law.

THE French Chamber of Deputies has just adopted an important proposition, which, put forward by MM. Raynaud Desplas, Puech, Paul Beauregard, and Adrien Veber, will considerably modify the existing practice of the Conseil d'Etat with regard to the expropriation of lands required for public improvements. Under the law of May 26, 1852, the administration had the power to acquire any lands which they considered necessary for the enlargement, improvement, or formation of streets, when it was considered that such extensions were essential to salubrity. They could also expropriate any property that, being outside the alignments, was deemed desirable for the extension or improvement of existing roads. The decree of June 18, 1876, restricted those powers by compelling the administration to obtain, in the latter instance, a Conseil d'Etat decree. The Conseil d'Etat, however, has, in such instances, nearly always refused permission to acquire such property. The new law adopted by the Deputies (and the Senate is not likely to reject it) provides, in effect, for the compulsory acquisition of lands and buildings required under a scheme of town planning or street improvement; and there is an express condition that if there remain outside the limits fixed for the execution of the plan any enclosures or parcels which, either because of their smallness or by reason of their situation, are not desirable sites for buildings, such lands may be expropriated for the purposes of the general scheme.

Hampstead Heath.

THE Heath, the whole Heath, and nothing but the Heath is demanded by the Hampstead Heath Protection Society, who held last week their thirteenth annual meeting. In the annual report which was then presented, it was stated that the committee had called the attention of the London County Council to the deposit of clay and other builders' refuse on the Heath; to the disfigurement of the East Heath through the cutting of the turf by order of the Council; to the destruction of plants by children during the holidays; and to the suggestion of the Hampstead Borough Council to cement the bottom of the lakes, which the committee contended would destroy the rural character of the ponds. Upon this last point the Society have received the assurance of the London County Council that the cementing will not be carried out. Sir E. Durning Lawrence, in moving a resolution urging upon the London County Council the imperative necessity of strictly carrying out their statutory duties under Section 16 of the Hampstead Heath Act, 1871, maintained that the Heath should be preserved, not for Hampstead alone, but for London at large. They did not want it "parkified," and he urged them all to preserve the Heath "as God made it." Lord Eversley was re-elected president of the Society for the ensuing year.

The Bridge at Hampton Court.

THE uncovering of the buried bridge in front of the west entrance to Hampton Court Palace, and the excavation of the moat, have, we are assured, immensely improved the appearance of the main entrance to the palace. As Mr. Ernest Law—to whose active interest in the matter the art-loving section of the public are greatly indebted—remarks in his description of the excavations, "the whole aspect [of the palace] will be rendered more interesting, more picturesque, and more characteristic of its age." The stone bridge which has now been revealed to full view, and has not only so signally justified the labour and cost of the operations by means of which it has been rescued from oblivion, but is also seen to vindicate the taste of its designers, was built by Henry VIII. in 1535, and had been buried since 1700. Mr. Law rejoices in "the wonderful transformation" thus simply effected "in this old Tudor façade, whereby it will be invested once more with that charm and romance of which William III. and Wren deprived it." We must confess that it is always painful to find Wren in association—actual or alleged—with anything that savours of vandalism. The excuse for him in this instance, and perhaps in some other cases, seems to us to be found in his intense modernity. In his day there was a breaking away from the old feudal traditions. The Englishman's house was no longer to be his fortress, but his home, suggesting peace rather than strife. But now, remote as happily we are from the "old, unhappy, far-off things, and battles long ago," a fortress pleases rather than pains us; and hence the restoration of Hampton Court Palace to a more complete realisation of this grim character is altogether delightful.

An Ardent Archaeologist.

WITH the eccentricities of the perfervid archæologist architects are only too well acquainted. He has broken out in a fresh place; or, rather, he has broken in. The remains of the Roman villa at Brading, in the Isle of Wight, are, for their better preservation, enclosed within a corrugated iron structure, which, it is understood, "the pure and simple-minded take," in quite a remarkable number of instances, to be itself the Roman villa. Sixpence (the charge for admission) stands between many a Cockney visitor and the correction of his very natural first impression. The holiday-making Dutchman is not so easily daunted. On Easter Sunday a visitor from Holland vindicated the repu-

tation of his countrymen for robust appreciation of art values. Denied admission by the door, he got in at the window, and he left behind him this polite note: "I wanted to see and appreciate that famous Roman art. I was so unfortunate to come here from Holland on Sunday. You refused me to enter on account of it being Sunday. I did everything I could to convince you, in vain. Nothing was left to me than to see it in a manner which is not the regular one. I climbed on the roof, but could not see through the windows. So then I broke this window. I give the sixpence (price of admission) to the poor of the isle.—Excuse me." The chief point that seems to strike the reporter of these strange doings is that, up to the time of going to press, nobody answering to the description of "a poor of the isle" had confessed to receiving the payment—the method of tendering it being "not the regular one"—of the price of admission; but for our part we feel more concerned at the omission by the enterprising Hollander to provide a reasonable indemnity for the breakage of the window.

"Loose Competitions."

WHAT are euphemistically termed "loose competitions" in American architectural circles come under the comment of our overseas contemporary "The Western Architect," so that the evils which we frequently decry about competitive work are not confined, apparently, to our own sea-girt islands. Some fifteen practitioners from four different States gathered recently at a certain town in Kansas, in response to an advertisement for high-school plans. A polite request to the School Board that entries be closed was responded to by an intimation that the Board would receive entries as long as it liked, and with a more impolite intimation that the Board knew its own business. "It might be unkind," says our contemporary, "to say that these architects 'got just what was coming to them,' but that is pretty near the fact." A competition of so loose and irregular a character should never have been touched by them. "School Boards, when they are made up of otherwise intelligent and honest men, are both densely ignorant and technically dishonest when it comes to an estimate of what an architect's services mean." Our contemporary opines that "both school boards and private individuals would have learned long ago that it was useless to try to get something for nothing," if the individual members of the profession pursued a proper line of conduct. This comes home to us very nearly, and is what most thinking men have said about competitions in this country at one time or another. What is it that makes reputable men foolish in their individual capacity and dishonest in a corporate one? If we knew that we should be able to solve the competition trouble instanter.

The Velasquez Dispute.

MR. GREIG, when he wrote to the "Morning Post" that he had discovered initials on the Rokeby Velasquez which were not those of the master, might well have said within himself, like Launcelot Gobbo, "Mark me! Now will I raise the waters." After the efforts which were made to raise the sum necessary to secure the picture for this country, such a suggestion comes as a painful blow to our national credit in picture-dealing. Our impression is that, in the words of one of the disputants, Mr. Greig's alleged discovery is a mare's nest, and that the supposed signature is an accidental mark of some kind. Several very competent pairs of eyes have examined the canvas closely, and cannot see what Mr. Greig asserts is there. But that does not settle the question. When the picture was exhibited many years ago at the Royal Academy Loan Exhibition, under the name of Velasquez, its authenticity was much questioned by painters, who admitted, nevertheless, that it was a very fine work. Sir William Richmond denies altogether that it is either by Velasquez or worthy of him, and he urges, with unquestionable force, that the opinion of a practical painter is worth more than that of people who only write about painting. On the other hand, Mr. Clausen, a very capable painter indeed, considers the principal figure to be by Velasquez, and a very fine piece of painting, though the accessories may have been painted in by another hand. Our opinion is in favour of Velasquez, in consequence mainly of the fine modelling and the anatomical suggestion of the framework of the body in the painting of the back. The argument as to the evasion (as is suggested) of the drawing of the hands and feet does not amount to much. But we are afraid the authenticity of the picture will always be regarded as somewhat open to question. The moral of the whole incident is the same as that which Mr. T. G. Jackson suggested, in a letter to the "Times," in the famous matter of the wax bust, viz., that people think too much of the name attached to a work of art, and too little of its intrinsic merits. In the case of the picture under discussion, there is (or ought to be) no question that a very fine work was secured for the National Gallery when the Venus was purchased. But there is no doubt that the bulk of the price was paid for the name of Velasquez, and it seems doubtful whether we got what we paid for.

Classic or Gothic for Churches.

THE Architectural Association Journal contains the report of a discussion on this subject at the Architectural Association Debating Society, the Classic side being upheld by Mr. A. E. Bullock, and the Gothic by Mr. W. G. B. Lewis. On a vote being taken at the close there was a majority of four on the side of Gothic. In the light of present-day views of architecture as the art of free expression in building, rather than of archæological reproducing of ancient types, it seems almost a question whether such a point should be debated at all. A church is a church, and there does not seem any innate necessity that it should be either Classic or Gothic. Admitting, moreover, that an architectural tradition should be followed, it may be pointed out that the Classic tradition for church-building is much older than the Gothic. It is almost impossible to discuss the subject without touching on questions outside of architecture. It is odd to find a well-known church architect, in the discussion, arguing that Gothic was more suitable for churches, "because that particular style is the product of the Christian religion." Surely Mr. Fellowes-Prynne had curiously forgotten history. The Basilica church was the product of Christianity, and that was to all intents and purposes a Classic form of building. The Gothic church is the product, not of Christianity, but of the version of it accepted by the mediæval church, the feeling of which is in reality perfectly different from that of early Christianity. The mysticism of the mediæval church is well expressed in the Gothic building; and that mysticism was a beautiful thing in itself, and was specially valuable in an age of rapine and violence, when people felt the church (both spiritual and material) to be a refuge from the violence and squalor of actual life.

But there was no such element of mysticism in early Christianity; the mysticism was a mediæval growth over Christianity; and Gothic is only a church style, not a Christian style in the larger historic sense of the word. At the same time, we should agree that an interior like St. Paul's, for instance, is somewhat cold and realistic in effect as a building for religious worship. It is partly a question of plan, too. The Byzantine type of plan, with its wide central area, is really more suited for congregational worship than the mediæval plan, which is essentially a processional plan; and the richness of Byzantine detail seems to present something more sympathetic with Christian worship than the comparative coldness and precision of Classic detail. We suggest that the ideal modern church architecture might be found, not in either Classic or Gothic tradition, but in an evolution from the Byzantine type, with a detail and decoration permeated with Christian (not mediæval) symbolism.

NOTES AND NEWS.

The Layman and "The Orders."

A Manchester correspondent draws our attention to an article in the "Daily Dispatch" of that city, upon the six columns that still rear themselves forlornly out of the wreckage of the old infirmary. The writer discourses most pleasantly and poetically over these "*Corinthian* Columns." Unfortunately the columns are *Ionic;* and the date of the issue in which the article appears is April 1st, though we hesitate to make the obvious connection. Our correspondent takes exception to the statement that "in destruction their beauty came"; for, he says, "they were beautiful before, and formed a part of one of the few nice pieces of work in Manchester." He thinks also it would be safer for the newspapers to adopt the word "Classic." We agree.

The Site of the Duke of York's School.

A question by Lord A. Thynne, in the House of Commons last week, elicited from Mr. Hobhouse a statement that shows the Government are not likely to be turned from their present intention of selling the site of the old school for building purposes. The question was evidently intended to suggest or request a delay in the scheme, so that the London County Council might have further opportunities of making representations to the Government on the question of keeping the site as an open space. Mr. Hobhouse, however, said that regard being had to the exceptionally large area of open space in the neighbourhood, there was no ground for anticipating any prejudicial effects, as suggested, to the health of the community. Replying to a question by Mr. Hoare on the following day, Mr. Hobhouse stated that the Government were advised that in the event of a sale the purchase money should be applied in the provision of a new school, and any surplus dealt with as provided by the Crown Lands Act, 1829. Incidentally, the cost of the new Duke of York's School at Guston, Dover, was given, the figure being £215,986, £185,600 being absorbed by the cost of buildings and laying out the grounds.

The R.I.B.A. By-laws.

We are informed by the Royal Institute of British Architects that "the Privy Council have approved the By-laws, as revised by the general meetings of the 7th and 15th February, 1910, with the exception of the new By-law 24. They have substituted for this the old By-law 22, with the addition of the Licentiates, and they have asked the Council to submit an amended form of words with reference to the action to be taken towards members who take part in competitions against the wish of the Council. This amendment will be taken into consideration by the Council without loss of time, and then recommendations will be submitted to the General Body."

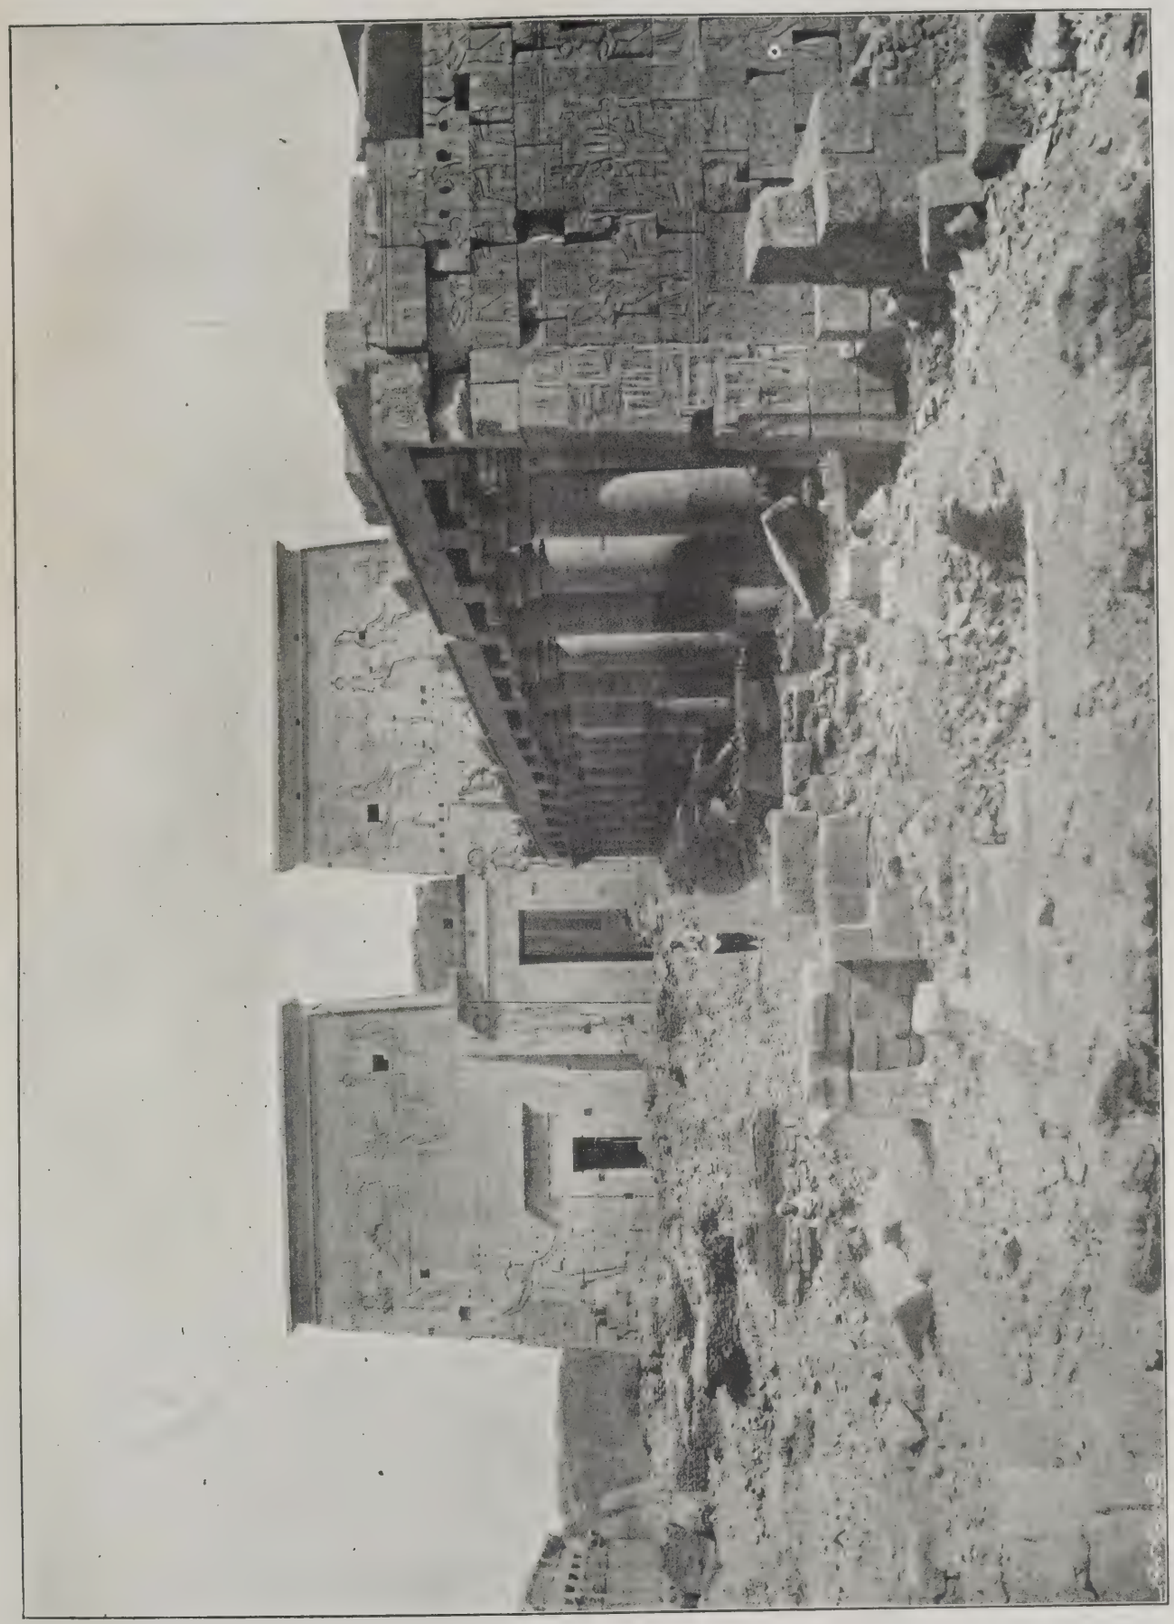
Obituary.

At the last meeting of the Royal Institute of British Architects, the Hon. Secretary, Mr. Henry T. Hare, announced the deaths of the following gentlemen: Mr. William Mansfield Mitchell, R.H.A., Past President, Royal Institute of Ireland, of Dublin; Mr. Jesse Horsfall, F.R.I.B.A., Manchester; and Mr. Charles Albert Munday, A.R.I.B.A. We also regret to announce the sudden death of Mr. William Owen, F.R.I.B.A., of the firm of William and Segar Owen, Warrington, on April 5th.

National Parks.

Discussing the proposals that have been made from time to time for the establishment of a British national park, a "Times" leader-writer concludes that the preservation of a number of comparatively small areas, each for the sake of its own local features, is the policy which is dictated in this country alike by natural and economic conditions. This policy is as applicable to areas set apart for the sake of their indigenous wild life as to spots distinguished for their scenic beauty or unique historical associations. More can be done in this country by watchfulness to prevent the extermination of birds, animals, and plants in small separate areas than by any attempt to create a kind of artificial Garden of Eden, with all creatures dwelling together under the eye of mankind in disregard of their natural habits. Though we cannot in this country set aside a single area for the preservation of all our rarest and most beautiful species, there is no reason to prevent our extending to them equally full protection on a more widely distributed basis. This is a question that town-planners are taking into serious consideration, and any serious contribution, such as the "Times" writer's, towards the solution of so interesting a problem is very welcome.

The Auld Brig of Ayr.



The works for the preservation of the Auld Brig of Ayr, which have been going on for three years, are now practically complete. Five years ago a great effort was made to save the old bridge, which had become unsafe, and was about to be rebuilt. Lovers of Burns were much alarmed, the engineering profession was so much moved that many engineers voluntarily surveyed the bridge, and Lord Rosebery uttered an earnest plea that it might not be wiped out of existence. The movement, thus powerfully supported, was, happily, crowned with success. The Town Council's first intention was reversed, and the bridge, which will be thrown open to the public this summer, is Burns's Auld Brig of Ayr, instead of a new bridge, which would have merely marked the site where the Auld Brig had been. There is, says the "Scotsman," no material change in the outward aspect of the bridge, but the fact that there is so little show for the expenditure of over £11,000 may be taken as an indication of the judicious manner in which the experts have carried out their work. Every stone in the structure was examined and probed, and every joint was cleaned out to an unusual depth and filled in with strong cement. The contours of the old bridge have been preserved, and even the broken-backed south arch is untouched, and it retains its abnormal appearance. The stone in the east parapet with the now almost obliterated outlines of two heads, said to be those of two ladies who originally built the bridge, is in its old position, and the undulations of the roadway also, to some extent, remain as before. The operations have brought to light the rudiments of an old gatehouse or watch-house on the east side. It is not considered probable that the Auld Brig of recent historic times is the original bridge, but there can be no doubt that it is the Auld Brig that Burns immortalized, and it is still substantially the structure that he knew. The whole work of preservation has been carried out under the personal superintendence of Mr. W. S. Wilson, C.E., Glasgow, and Mr. J. A. Morris, F.R.I.B.A., with whom was associated Mr. John Young, Burgh Surveyor, of Ayr.

Photo G.P.P.

Some 300 of these statues are being completed for the festival for which extensive scenes, reproducing St. Paul's, Westminster Abbey, London Bridge etc., are being constructed.

STATUES FOR THE FESTIVAL OF EMPIRE AT THE CRYSTAL PALACE.

This gives a very good idea of the Egyptian incised figure sculpture as portrayed in complete profile.

SCULPTURE AS APPLIED TO BUILDINGS.

By F. W. POMEROY, A.R.A.

[*This interesting and descriptive lecture formed one of the series given at the Carpenters' Hall. Mr. Pomeroy, in face of the immense field covered by his title, gave a general survey from the earliest times to the present day, illustrating each period by examples shown on the screen.*]

IT is quite impossible in one lecture or in a series to give you an adequate account of figures and sculpture in connection with architecture; all I can do is to draw your attention to certain qualities which are necessary. First I would draw your attention to certain terms used among sculptors. Sculpture is derived from the word *sculpo*, "I carve," and is applied to all imitation of natural forms, whether modelled in clay or wax, carved in wood or ivory, or hewn in marble or granite. Sculpture is divided into two classes: (1) All complete figures, whether single or grouped, seated, standing, or recumbent. (2) All figures placed in a flat plane, called bas-reliefs. This second division is distinguished further as: (a) Bas-relief where figures are in low relief, only projecting slightly. (b) Mezzo-relief, when figures are half in the round. (c) High-relief, or alto-relief, where figures are standing well out, but slightly attached to the flat background. In Renaissance and modern work we find all these types. The management of relief work requires great skill. Simplicity is one of the most necessary conditions of fine bas-reliefs. Bas-relief work has some of the principles of painting, and some of the finest sculptures existing are of this type. The ancient Egyptian sculptors, of whom the Greeks learnt so much, placed their figures on their bas-reliefs in complete profile, and the Assyrians also adopted this plan. Now take sculptured figures in the round. When a statue or figure is rather above natural size it is called "heroic." This is from eight to ten feet in height. The Greeks used 8ft. 4in. for their figures in the tympanum of the Parthenon. When they are above this height they are called colossal, and when half life size "statuettes." Material is a great consideration; whether it be hard or soft it influences the design and treatment. We will begin at the period of which we have actual record. By these examples we shall see that the early progress of art was a gradual one.

Periods of Sculpture.

We will divide sculpture into five periods:

(1) Early Egyptian and Assyrian.

(2) Antique, by which we comprehend Greek and Roman to the end of the fourth century, namely, from 700 B.C.—400 A.D.

(3) Mediæval sculpture, embracing all the periods from the sixth to the fourteenth centuries.

(4) Period of style of the Renaissance, or new birth, from the fourteenth to the close of the seventeenth century.

(5) Dating from the close of the seventeenth century to present times.

Egyptian Sculpture.

The early Egyptians had a wonderful knowledge of sculpture, and used granite, porphyry, and other materials, and their carvings have come down to us as perfect as when they were carved. They had the power of impressing the beholder with finely conceived masses.

Greek Sculpture.

At the fall of Nineveh, B.C. 606, early Greek work was in its infancy. At about this time attempts were made to take records of the victors in the Olympian games. In these statues much more attention was paid to a man's body and limbs than to his face, as a man was known more by his limbs than his face. In the early period of Greek art the gods were only distinguished from one another by their dress, and both in sculpture and painting had their names written on them.

In the best period of Greek art these attributes become of little importance and are sparingly introduced. Slides were shown of the pediment with tympanum of sculptured figures from the temple at Aegina. These Etruscan figures were quite detached from the background, this being essentially a potter's work. It is also interesting that the figures in the pediment follow up the line of the columns underneath. Views of the Acropolis followed, with details of the fragments of the figures from the pediments of the Parthenon, together with larger scale details of each figure separately, these being, the lecturer said, the finest things the world has ever seen. Several metopes, and various views of the great frieze which runs all round the building within the peristyle, were also shown, and in all of these latter the front plane

carving should be noticed, that is, that the surfaces are cut back from the front. The Madeleine, Paris, was shown as an illustration of how imperfectly the tympanum is filled. The sculpture itself is very beautiful, but only shows that the sculptor should be called in to advise earlier in the day.

One of the Caryatide figures from the Erectheum, that masterpiece of Greek art the Nike of Samothrace, a piece of the frieze from the Mausoleum of Halicarnassus, and a piece of the frieze from the Temple of the Wingless Victory completed the examples of Greek art.

Roman and Romanesque Sculpture.

The Romans were not so artistically inclined a people. They began by conquering the Greeks and copying much of their work. They also derived much of their art from the Etruscans, who introduced the round arch, brought from Asia Minor, and, using this as a powerful means of support, it became a great factor in their buildings. The toga was also originally derived from the Etruscans. The Romans first contented themselves with copying Greek work, but in the reign of Augustus they gave themselves over to portraiture, and some very fine examples were produced. The figure of Hadrian, an Etruscan tomb of terra-cotta, and some tanagra figures from the British Museum were shown. The Romanesque or Byzantine period commenced when the seat of the Roman Empire was removed in 320 A.D. from Rome to Byzantium, and the Church of St. Sophia at Constantinople is the most typical example of this type of architecture. St. Mark's at Venice and a church at Ravenna are also fine examples of Byzantine architecture. The use of mosaics became general in the Byzantine churches.

Mediaeval Sculpture.

At the beginning of the Christian era sculpture was in a parlous condition, and it was not until the twelfth century that the art of figure sculpture can be said to commence. Some early sculpture was shown from a church at Arles, in the south of France, Chartres Cathedral, whose long lines of figures harmonize so well with the architecture, and Rochester Cathedral. The sculpture of the Early English period in England from Wells Cathedral is equal in beauty of decorative effect to anything on the Continent. Some interesting tombs from Exeter, showing the slab-like treatment, were shown, and also some carving from the choir stalls at Amiens Cathedral, and one of the famous bronze statues at Innsbruck.

The Romanesque churches show decorations with mosaic rather than sculpture.

INTERIOR, ST. APOLLINARE IN CLASSE, RAVENNA.

("*Sculpture as Applied to Buildings.*")

The Renaissance.

The Renaissance really began by Nicolas Pisano, who, in 1278, had to design a pulpit for the cathedral at Pisa, and who derived his studies for the carving on the pulpit from a Roman sarcophagus in the Campo Santo at Pisa. A specimen of marble pattern on a flat surface was contrasted with a modelled surface by Giovanni Della Robbia, and the famous statue of St. George by Donatello was also shown. Every period of art generally contributes to the progress of art in two ways: (1) New things are created, and (2) old things are devised in a new way. The Colleoni statue, Venice, the statue of Lorenzo de' Medici by Michelangelo, were shown,

The two figures on the sarcophagus are "Dawn" and "Twilight"—Dawn being represented by the female figure on the right; Twilight by the demi-god figure on the left.

and then a fountain in Vienna, showing the appropriate use of figures on a fountain.

Modern Sculpture,

The lecturer remarked that there were few good fountains either in England or France, but drew attention to the beautiful one in Piccadilly Circus, which would be much improved, he said, if the bad architectural setting around it were removed. Groups from the Arc de Triomphe and the Opera House, Paris, and the tomb of Alexandre Dumas, with sculpture by Gustave Doré, which showed, Mr. Pomeroy said, how not to do it, as this example contained all the vicious qualities of sculpture; some work by Rodin, a specimen of work by Flaxman, who received little patronage from his fellow-countrymen, and the Wellington Monument in St. Paul's Cathedral by Alfred Stevens, who died practically

(Sculpture as applied to Buildings.)

broken-hearted, owing to the lack of appreciation for his talents in this country; and, lastly, a group, "Hounds in Leash," by the late Harry Bates, finished the lecture. Bates also died young, and though he had very little training was a most wonderful sculptor.

Of the illustrations accompanying this report of Mr. Pomeroy's paper, the view of the Outer Court of the Temple of Isis at Philae will be of interest, not only because the recent barrage schemes on the Nile have now obliterated this beautiful relic of ancient Egypt, but also because it illustrates very clearly the profile presentation of Egyptian sculpture. The detail view of the centre west doorway at St. Mark's is not often seen; that of Chartres is fairly familiar. The group, "La Résistance," on the Arc de l'Étoile, or the Arc de Triomphe, as it is popularly called, at Paris, is by Antoine Etex; the most famous of the groups there is by François Rude, and is frequently illustrated.

BRUNELLESCHI AND THE RENAISSANCE.

By PROFESSOR BERESFORD PITE, F.R.I.B.A.

[*This is the second and concluding part of a short abstract from a long and interesting paper read before the Architectural Association. The first part appeared in our issue of last week. A considerable portion of the paper consisted of historical references, extracts from contemporary documents, biographies and critical studies of the Italian Renaissance, which helped admirably towards an understanding of the times and events which influenced Brunelleschi and his contemporary artists. Exigencies of space compel us, however, to confine our summary to the more important events and works of this great master as set forth in Professor Pite's paper.*]

The Board of Consuls appointed four additional citizens as assessors to assist them in deciding, and spent some months in anxious deliberation upon the models. Brunelleschi presented a report which has been preserved in the pages of his biographer and Vasari. The latter depicts the author as previously discussing with the committee in such growing heat at their inability to understand him that they ordered him to leave the room which, he refused to do, and was removed, though, ultimately, as we have seen, he was appointed with two colleagues.

Brunelleschi's Report.

The report is of sufficient clearness to guide us to an understanding of his scheme, and may be cited at some length.

The difficulties of this erection being well considered, magnificent signors and wardens, I find that it cannot by any means be constructed in a perfect circle, since the extent of the upper part, where the lantern has to be placed, would be so vast that when a weight was laid thereon it would soon give way. . . . I have, therefore, determined to turn the inner part of this vault in angles according to the form of the walls, adopting the proportions and manner of the pointed arch, this being a form which displays a rapid tendency to ascend, and when loaded with the lantern each part will help to give stability to the other. The thickness of the vault at the base must be three braccia and three-quarters; it must then rise in the form of a pyramid, decreasing from without up to the point where it closes and where the lantern has to be placed, and at this junction the thickness must be one braccia and a quarter.

A second vault should then be constructed outside the first to preserve the latter from the rain, and this must be two braccia and a half thick at the base, also diminishing proportionally in the form of a pyramid in such a manner that the parts shall have their junction at the commencement of the lantern, as did the other, and at the highest point it must have two-thirds of the thickness of the base. There must be a buttress at each angle, which will be eight in all, and between the angles in the face of each wall there shall be two, sixteen in all; and these sixteen buttresses on the inner and outer side of each wall must each have the breadth of four braccia at the base. These two vaults, built in the form of a pyramid, shall rise together in equal proportion to the height of the round window closed by the lantern. There will thus be constructed twenty-four buttresses, with the said vaults built around, and six strong and high arches of hard stone, well clamped and bound with iron fastenings, which must be covered with tin, and over these stones shall be cramping-irons, by which the vaults shall be bound to the buttresses. The masonry must be solid, and must leave no vacant space up to the height of five braccia and a quarter; the buttresses being then continued, the arches will be separated. The first and second courses from the base must be strengthened everywhere by long plates of hard stone laid crosswise, in such sort that both vaults of the cupola shall rest on these stones. Throughout the whole height, at every ninth braccia, there shall be small arches constructed in the vaults between the buttresses, with strong cramps of oak, whereby the buttresses by which the inner vault is supported will be bound and strengthened; these fastenings of oak shall then be covered with plates of iron, on account of the staircases. The buttresses are all to be built of hard stone, and the walls of the cupola are, in like manner, to be all of solid stone bound to the buttresses to the height of twenty-four braccia, and thence upward they shall be constructed of bricks, or of spongite, using the lightest. Eight ribs of marble shall be formed at the angles of the external surface of the cupola of such thickness as shall be requisite; these shall rise to the height of one braccia above the cupola with cornices. Thus the cupola shall be constructed after such manner as shall be determined by the masters who may have to build it, since practice teaches us by what methods to proceed.

This remarkable document shows actually the parting of the ways between rib-vaulting and domical construction. The horizontal linking together of the buttress ribs with lateral arches, the provision of double vaults, and the clear perception of the effect of putting weight upon a semicircular vault, all evidence an intelligent discerning analysis of the Roman examples.

The design included a great bond of timber near the base, bound with iron ties, to encircle the dome and collect any outward thrusts; this was completed in August, 1423. The position, intention, and design of this tie is interesting in connection with the Italian practice of relying upon ties to their Gothic arches; this bond timber has answered its purpose fully, and, realising that the whole stability and success of the vault consisted in maintaining a horizontal system by means of the connecting arches between the buttresses, we regard this timber bond as an additional precaution illustrating the same principle.

We cannot stay to dwell upon the interesting story of Brunelleschi's relationships with the Guild properly charged with building, who actually once locked him up for being a blackleg, or his professional difficulties with Ghiberti, whose appointment resulted in nothing but unpleasantness. Brunelleschi's mechanical and organising genius found ample scope in the design of flying scaffolds and screens, after that the vault had risen to a point where it became dangerous to the workmen, but consistent perseverance with the system of horizontal binding by arches, the wooden bond, and series of stone cross-ties between the two vaults succeeded, so that at length, on June 12, 1434, the cupola closed over the central space. The lantern still remained to be its crown. For this Brunelleschi had made a model, but the co-operative idea was so strong that other designs were invited and considered, among them one by an adventurous but aristocratic lady.

Meetings and discussions ensued, and on December 31, 1436, the Board unanimously decided "that the said lantern should be constructed and built according to the model of Philip Master Brunelleschi, and that the ordering and execution of the work should be committed to Philip."

The procuring of marbles for this work and some years of delay ensued, together with war, plague, and contentions. The funds fell off, Brunelleschi's salary was reduced one-half; for three years there is no record of work. In 1445 it was resolved that "Philip, who said that he could do the work," be appointed "sole overseer for the term of his life"; with the extraordinary qualification but "no longer," at a salary of 100 florins annually.

Brunelleschi was now 69, and died on April 16, 1446, without seeing the completion of the lantern.

Brunelleschi's Other Work.

Brunelleschi's life-work was not, however, confined to or limited by the completion of the Duomo; in 1420, the year of the model of the cupola, he began the erection of the Mortuary Chapel for the Pazzi family in the cloister of Santa Croce, a small rectangular apartment covered by a most interesting convoluted dome supported upon pendentives; this work exhibits with fullness the charm of Brunelleschi's power as a draughtsman and designer. The elegance, refinement, and originality of the whole are wonderfully fascinating and characteristic. The original vigour of the vaulted atrium, with its delicately moulded attic storey and beauteous frieze, the delicacy of the doorway, and the entire freshness and grace of the relief and treatment make this work a gem of Renaissance, as it indeed is its first full architectural flower.

In 1421 he designed the portico to the Foundling Hospital, which has the celebrated bambinos of della Robbia, a work characterised by the same delight in graceful proportions and refined mouldings, qualities which, it may be noted, were not derived first hand from Classic precedent, but infused by his own genius.

Other Churches.

In 1426 the foundation of the great church of San Lorenzo was laid; in the simplicity of this plan and the great success of the order and arcade, the same quality of refined grace is working upon a basis, well laid, of early basilican planning. The late Roman tradition is laid aside, and the architectural value of the order demonstrated without pedantry or antiquarianism.

The sacristy, the older one, of San Lorenzo, the Medici Chapel, with the monuments by Michelangelo being called the New Sacristy, is also one of the most remarkable and successful buildings of Florence. The dome is employed upon properly developed pendentives over the square apartment, and again over the altar recess. The fresh originality and freedom is very interesting, the architect evidently feeling his way to originality in dealing with his problem, reflecting with ease and pleasure the fruits of his classic studies.

The Church of San Spirito was begun in 1428, and follows San Lorenzo very closely both in plan and effect; these make a remarkable pair of churches, like sisters resembling each other with a charming family grace and elegance.

No work of Brunelleschi's after the Pazzi Chapel has such a direct appeal to an eye jaded with the later richness of the Renaissance as the Badia at Fiesole, illustrated and described with enthusiasm by Mr. Anderson. It illustrates remarkably that the discovery of the inexhaustible store of Classic ornament, and of its luxurious use, had not in any way corrupted a strict and almost Puritan taste in the employment of decorative features. The cloister, the chapel, and the refectory are simply delicious in their delicacy, and in the complete value accorded to each ornamental feature and element. The

This figure is part of the monumental doors for the Museum of Decorative Arts at Paris, on which M. Rodin has been engaged for a great number of years. The whole work suggested by Dante's Inferno is called "La Porte de l'Enfer." "Le Penseur" is seated in a recess above the actual doors, and dominating the whole.

SCULPTURE AS APPLIED TO BUILDINGS: "LE PENSEUR," BY AUGUSTE RODIN.

proportions are not guided by any convention, and are fresh and natural to the building. The carving evidences the fastidiousness of a goldsmith in dealing with a rare opportunity in a precious metal.

The civil buildings that fell to Brunelleschi are neither few nor unimportant. His reputation brought him private patrons, for whom he designed the immense Pitti palace; the setting out of the immense façade to the Piazza is his, though the front to the Boboli Gardens is after and by Ammanati.

What the Renaissance movement owes to Brunelleschi it is not easy to estimate; the debt is at once so great and so involved with the completion of mediævalism.

Mr. H. H. Statham remarked upon the glamour that surrounded the name of Brunelleschi, and the remarkable foresight that characterised his work. An example of this was the insertion of the requisite ties in the dome. Lack of these had almost proved the downfall of the dome of St. Peter's at Rome. He wondered why Brunelleschi had not made a circular dome with small pendentives. It would be interesting to know the method by which the dome was constructed. The delicacy and restraint with which the moulding were treated was admirable; and quite a different effect from the usual Renaissance form was produced. He always inclined to the spherical dome as being a thing of greater beauty than the octagonal form.

Mr. Allen Potter observed that they had had two personalities before them—Brunelleschi and Professor Pite. Until two years ago the construction of the dome without the aid of centering had been to him (Mr. Potter) an entire mystery. A suggestion had then been made by a gentleman in Florence that the inner shell of the dome was the permanent centering of the dome. Just as the circular dome on pian was built on an arched wing, so was constructed a dome of eight sides on eight flat arches, which created a thrust at the angles. What were usually said to be ribs were really buttresses to the shell. Brunelleschi went to Rome with a definite ambition—to learn how to dome the Florentine cathedral. With Brunelleschi details were details, and not features; and the supreme importance of constructional accuracy was always the prevailing consideration. Mediæval influence was evident in the plan, which expressed monasticism converted into terms of a Roman Christian church of the time of Constantine. Replying to Mr. Statham, who then asked whether each face was a flat arch, Mr. Potter replied yes, but he thought not visibly so.

Mr. H. P. G. Maule emphasized the importance which Brunelleschi attached first and foremost to construction, and allowed effect to take a secondary position. The lecture illustrated admirably the vital necessity of solving constructional problems.

The Chairman. Mr. C. Wontner Smith, wondered that the great weight of the lantern imposed upon the top of the dome had not forced the sides out. It was curious that domes should cause so much sensation. Perhaps in the case of Florence the reason was to be found in the fact that this was the first dome to be constructed with an inner as well as an outer face.

The Lecturer. Professor Pite, in reply, said evidence proved that Brunelleschi had had special bricks made for the construction of the dome. Mr. Statham asked whether Vasari had not mentioned bricks with a rebate on top for the purpose of fixing. Mr. Pite agreed that it might be so, but Vasari was a somewhat unreliable authority. Mr. Potter's point was by no means new; and with regard to the creation of a dome with pendentives, this was rendered impossible by the height that had already been reached when Brunelleschi commenced operations. A model had been built at the time demonstrating the height to which a dome could safely be constructed of bricks. The cone of St. Paul's dome, London, Professor Pite recalled, was built of brickwork without centering. Brunelleschi insisted, and rightly, that the more weight placed on the dome the more stable it would become.

THE CHURCH OF SAN LORENZO, FLORENCE. FILIPPO DI SER BRUNELLESCHI, ARCHITECT,

(Brunelleschi and the Renaissance.)

DISCUSSION.

Mr. Spencer Beckwith proposed a vote of thanks and observed that what greatly interested him was the spaciousness of the Italian churches. Gothic was introduced by the Franciscans to fill a great need of the day, namely, that of preaching; and it seemed reasonable to assume that the style was imported from France. He believed that it was the really great personality of Brunelleschi that made him in architecture what Giotto was in painting, and Donatello in sculpture.

Mr. Walter Cave seconded the vote of thanks, and said that the great point of the lecture was the individuality of Brunelleschi. History showed that architecture came gradually from the East to the West; and when, therefore, Gothic went to Italy, it was going back, and was doomed to failure. He wondered whether it was correct that Brunelleschi and Ghiberti considered only the internal appearance and the construction of the dome, and had no regard for external effect.

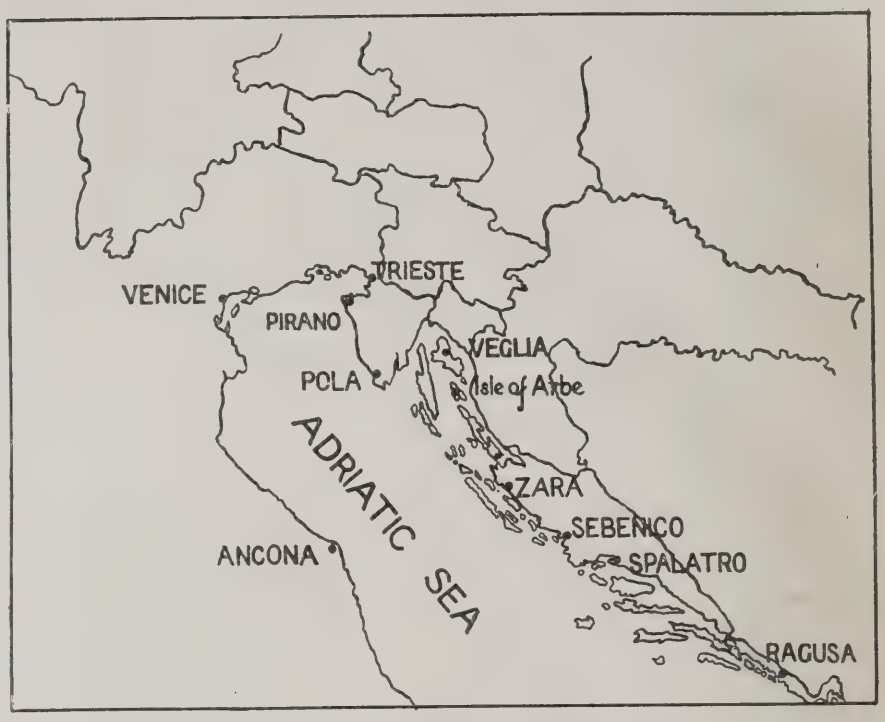
This view is of special interest as showing the model by Stevens for the equestrian group in position on the monument, as he intended it. The finished bronze based on this model is being prepared under the supervision of Mr. John Tweed, Sculptor.

THE WELLINGTON MONUMENT, ST. PAUL'S CATHEDRAL. ALFRED STEVENS, SCULPTOR.

ARCHITECTURE ON THE EASTERN SIDE OF THE ADRIATIC.

By GEORGE HUBBARD, F.S.A.

[This is a short abstract of an article read before the R.I.B.A. Mr. Hubbard concludes that it is not the Turk or the Serb who has left the lasting memorials on this side of the Adriatic, but the Latin races and their descendants. Those to the north appear to be mainly of Venetian origin or influence; towards the south the remains are mainly Roman.]



Island of Veglia.—Present walls were built circa 1133, and at the ancient Porta Pisana, under Venetian rule, the Duomo is a twelfth-century building, Byzantine in the main, with a flavouring of Romanesque. The columns, of irregular lengths, appear to have come from some older building. The capitals were made to fit these columns, the irregularity being adjusted in the abaci, so that springing of the arches should be at one level.

Isle of Arbe.—Was under Venetian rule. The Venetian Campanile, circa 1200, is a fine example, 20ft. square at the base and 90ft. high exclusive of the spire.

Pirano.—Has no particular interest, but city walls and towers on the land side are picturesque.

Pasenatico.—An out-of-the-way town, 12 miles inland, and rarely visited by travellers. Church of San Lorenzo was formerly seat of the Venetian Governor of Istria. The building possesses the germs of the Romanesque. So crude is the church that the nave arches are of different heights. Capitals appear to be debased Roman, but bear a Byzantine character, with the large impost blocks. One window, never glazed, in apse of south aisle, is purely Romanesque, and covered with a rough tracery of interlacing circles.

Parenzo.—The Duomo was built between 535 and 543. It is as fine as Sant' Apollinare in Classe at Ravenna or Santa Fosca at Torcello, and in the completeness of its plan with its atrium and baptistery it surpasses them. This Byzantine basilica of the first period has fortunately been spared to us almost wholly in its original state. In 1881 it was necessary to lay a new floor 12 inches above the old one. I saw a still earlier floor 3ft. 9in. below the present one. This may be late Roman work, a floor in fact of a Roman building which stood on the site. The capitals supporting the arches around the atrium are deeply cut, showing in fine relief the rich Byzantine tracery on their convex outline. In some cases the columns appear to have come from an earlier building, as they do not in all cases fit the capitals they support. To the west of the atrium is an octagonal baptistery, with a sinking in the floor where probably a marble lined piscina previously existed. To the west again of the baptistery stands a fifteenth-century Venetian campanile. The perfection of Byzantine art is realised in the interior. The episcopal throne is at the east end of the nave apse, and the marble seats for the clergy are placed right and left of the throne around the sweep of the apse, the ends of the seats being terminated by dolphins. The chief glory of the east end is in the early Byzantine mosaics of the sixth century, which form a high dado above the seats of the clergy. To modern ideas the combination of materials that have been employed in this mosaic may seem incongruous. Burnt clay of a dull deep red colour, obscure glass, polished marbles, and flat oyster shells have all been employed; but combined together they give such an effect as would be impossible of attainment in glass alone. The oyster shells still keep their gleaming pearly whiteness, and give peculiar emphasis to the design. The centres of the panels are sometimes polished slabs of porphyry. On the centre panel, over the episcopal throne, is a gold cross on a ground of serpentine and mother-of-pearl.

MAP ILLUSTRATING THE POSITION OF SOME OF THE TOWNS MENTIONED IN MR. HUBBARD'S PAPER.

It is Mr. Hubbard's contention that it is neither the Turk nor the Serb who has left last memorials on the eastern side of the Adriatic, but the races of Latin descent. On the north, the remains are chiefly Venetian; on the South, Roman.

Pola.—An Austrian naval base, must have been an important Roman town. The shell of a great Roman amphitheatre stands outside the city boundaries. The theatre would hold 21,000 spectators, besides 10,000 who might take part in the performances. This great elliptical hollow shell now forms a mighty enclosure to grazing grounds. At the terminals of the long and short axes, projecting towers have been built. In the windows of these towers curious tracery exists. The tracery is formed by piercing stone slabs and sometimes by the building in of square balusters. Besides the amphitheatre there is the Porta Gemina. Within the town, however, stand two Roman temples, one of which is still perfect.

Zara.—Approached through the Porta Marina, a Venetian structure. Circular Church of St. Donato of the type of San Vitale, Ravenna, or the Cathedral of Aix-la-Chapelle. It has a circular space in the centre rising to the roof, and a two storeyed circular aisle surrounds it. The amazing interest of this church is, however, revealed in its foundations. The earth over a portion of the interior has been excavated to a depth of perhaps four feet, and the foundations exposed. Here, lying in a perfectly promiscuous manner, are great blocks of Roman entablatures, the drums of marble columns, and classic fragments

The cathedral is basilican in plan. This Romanesque building, with its arcaded west front, is considered by Fergusson to be superior to San Michele or San Martino at Lucca, or the Cathedral at Pistoja or Sta. Maria at Arezzo. Its simple west porch, with its members of the arch truly corresponding with the shafts, is very correct in detail. The west front was built in 1324. Another fine example is St. Grisogono, with external arcaded apse and delicate colonnade. It is very doubtful whether anything finer of its kind could be found among the Lombard churches of Italy. Its date is 1175. The west front dates probably from the beginning of the fifteenth century.

Sebenico.—The cathedral is unique in construction, everything being constructed of stone, marble, or metal. The walls and roof are of stone, neither timber nor tiles being employed. The whole construction of the roof over the nave, aisles, and tower is equally apparent, whether viewed from the interior or exterior of the building. The west end and nave were designed in Italian Gothic style by Master Antonio, and built between 1431 and 1441, when Master Giorgio Orsini of Venice was engaged to complete the work. The latter's work exhibits the Renaissance influence.

Trau.—The Duomo is an important building, begun about 1200, and various parts bear dates as completed. The body of the church was completed in 1440; lower part of the tower is dated 1421, but the whole was not finished until 1598. Church is pure Romanesque with basilican plan and a beautiful Galilee porch, perhaps the most perfect Romanesque example that exists. The carved work of this narthex is finished with a marvellous perfection of execution. On either side of the west doorway are great archaic lions, standing on classic consoles; they project out boldly at a height of perhaps six feet from the ground. They support brackets on which Adam stands on the south and Eve on the north, nude figures, life-size, having some of the imperfections of the period when they were executed.

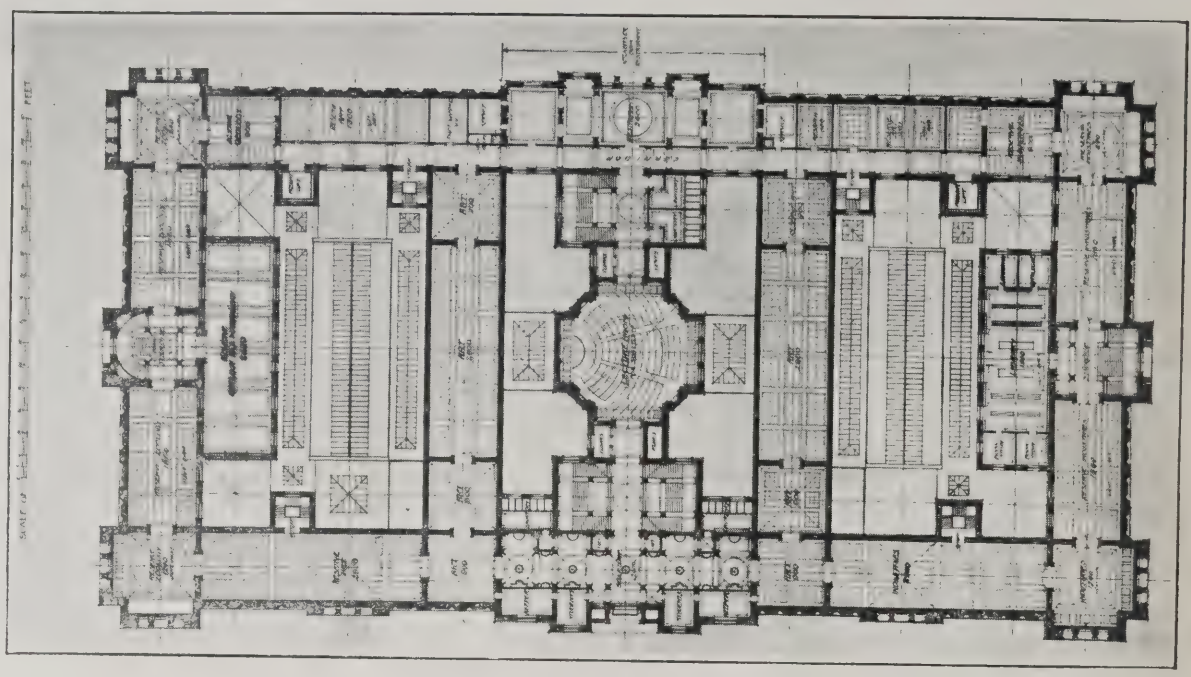
Spalato.—The famous palace of Diocletian is familiar from Adam's monumental work on it, published in 1764. It is a rectangular building, the four walls defended by square and octagonal towers; on the south front, towards the sea, is what Adam called the great cryptoporticus, having a frontage of over 500 feet. From this gallery, or cryptoporticus, some of the royal apartments could be entered. The royal apartments were to the south, and they were flanked on the west and east by an elaborate system of baths. The octagonal building in the south-east section is called by Adam the "Temple of Jupiter," but it is suggested by Dr. Arthur Evans that Diocletian intended the edifice to be his mausoleum. The building is now, however, converted into the Cathedral of Spalato. The small temple in the south-west section was referred to by Adam as the "Temple of Aesculapius." The principal entrance was on the north, which is still called by the ancient name "Porta Aurea" or Golden Gate. The east gate was the "Porta Aenea" or Bronze Gate, and the west gate "Porta Ferrea" or Iron Gate. Anderson and Spiers show four striking departures from true classic in the buildings, which exhibit the decadence of Roman architecture, though Spalato is not the first to exhibit any of them. These four are: (1) The arch over a wide central intercolumniation. (2) Capitals carrying an arch without intervening entablature. (3) Columns carried on corbels. (4) The accentuation of the Roman relieving arch over a lintel by enriching it with mouldings.

Salona was a mighty city, destroyed by the Avars. It was surrounded by a wall in which traces of eighty-eight towers have been found. At one of the city entrances three arches stood, the centre one for vehicular traffic and the side ones for pedestrians. The paved roadway here, as at Pompeii, shows worn ruts some 6 inches deep. Within the ancient walls are a great amphitheatre and the remains of a curious Christian basilica. A vast number of stone sarcophagi were being unearthed by Professor Bulié when I was there.

Ragusa is surrounded with massive walls which climb the mountain side. They are stupendous; their very magnitude conveys the impression of impregnability. Great towers stud the circling mighty walls which crown the verge of an inaccessible precipice. The town is approached over a drawbridge. The most interesting building in Ragusa is the Palace of the Rector of the Ragusan Commonwealth, and its complex history has been most cleverly unravelled by Mr. T. G. Jackson, and those who wish to know more about it should read his account of it.

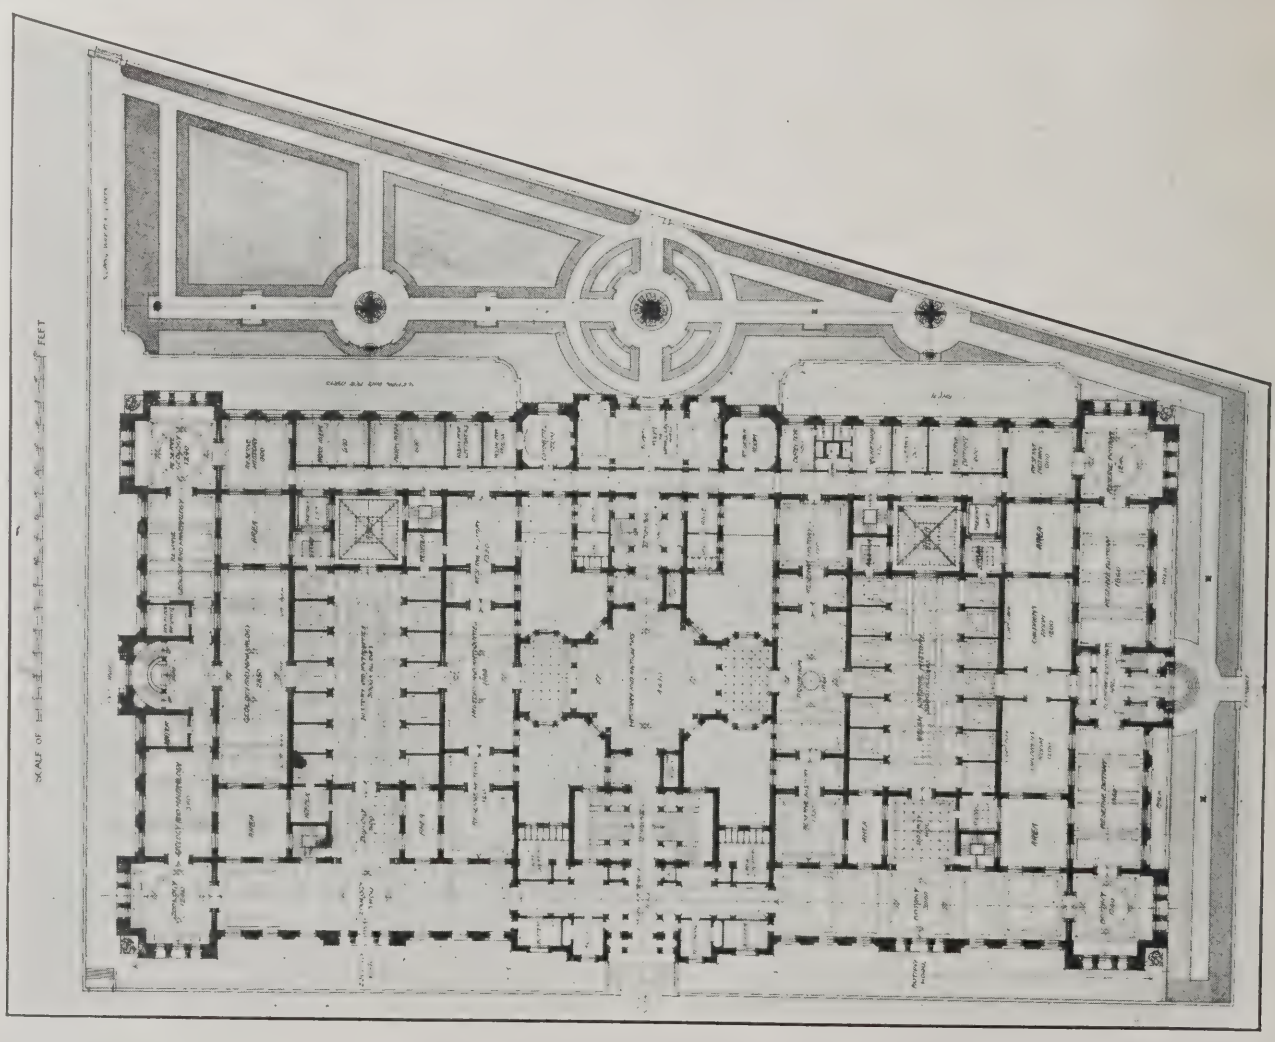
DISCUSSION.

Mr. T. G Jackson proposed a vote of thanks, and said that he knew the country which formed the subject of the lecture better than any other except his own. It was now twenty-eight years since he first saw Dalmatia, and since that time many improvements had been effected. There were now greatly increased travelling facilities — more steamers and more railways—and even Cook's conducted tours were frequent and usual. It was not, however, a tourist country. The roads were atrocious, being mostly mere tracks over stony heaths. There were no guide books when he went; and the sketches by Professor Freeman, whose interest ceased at about the eleventh century, were of no practical use. He had the country almost to himself. Its history, of which there was no proper record in existence, was very curious, and really dual in character. The towns and the country were quite distinct. In the former one saw the embodiment of the old municipalities of the Roman Empire, and the inhabitants spoke in the Latin tongue. The country outside the towns, however, was peopled by Slavs. Government went on, and laws were made with towns without reference to a supreme authority as Hungary or Venice. Each was entirely independent and they dealt with one another quite without external intervention. It thus came about that the history of every town had to be studied separately. Where archives were accessible it was usually found that they had been carefully studied, usually by some local authority. The Dalmatians travelled very little, and had, therefore, a strong patriotic feeling of citizenship. The people had always striven to surpass their neighbours, and this was undoubtedly the secret of the fine monuments which were everywhere found. An almost exact replica of the lancet window at San Lorenzo, to which Mr. Hubbard had referred, was, curiously enough, to be found in Northamptonshire. An extraordinary wealth of treasures in the forms of embroideries, church vestments, silversmiths' work, such as chalices, etc., was preserved in the country. Most of the latter work was of Venetian origin, and in some cases beautifully enamelled. The Slavs themselves produced very little architecture. There were Slav artists, but all were Latinised. The art of the country really came from the Latin population of the cities. Mr. Jackson then concluded his remarks with brief reference to some of his own drawings which had been lent for the occasion, and expressed his hearty appreciation of Mr. Hubbard's paper.



Mr. R. Phene Spiers seconded the vote of thanks, and said that Freeman was not acquainted with much of the work that had now come to light. He then commented upon four features of the Palace of Diocletian, in regard to which some misunderstanding was current, and illustrated his points with lantern views.

Dr. Arthur J. Evans supported, and observed that it was necessary to bear in mind the fact that the architecture was dependent on the physical and geographical conditions of the country. On the coast of Dalmatia civilised life had existed four or five centuries B.C. They had then the Roman conquest; and when Rome passed away the interior relapsed into barbarism. Dialect, wind, and weather, all seemed somehow to fit in with the architecture of the country.



The Lecturer. Mr. Hubbard made a brief reply, and drew attention to an exhibition of costumes, etc., from the Balkan States, which was being held in an adjoining room. He was told that the work was extremely fine; it was all done entirely by hand, no machine being employed.

THE MANOR HOUSES OF ENGLAND.

The Manor Houses of England. By P. H. Ditchfield, F.S.A. Illustrated by Sydney R. Jones. London: B. T. Batsford; 1910.

What is a Manor House? The author quotes from Mr. Scargill-Bird ("Guide to the Public Records"), the definition of a Manor, as follows:—

"A circuit of ground granted by the King to some baron or man of worth, as an inheritance for him and his heirs, with the exercise of such jurisdiction within the said compass as the King saw fit to grant, and subject to the performance of such services and yearly rents as were by the grant required."

The manor house, therefore, was the principal house on the estate, the dwelling of the person thus dowered by the King. It was not a mansion or a palace, but essentially a dwelling-house, built (in Bacon's phrase) "to live in and not to look at," and built almost invariably with the materials nearest to hand, and with local labour. Hence those old manor houses which are still remaining are not only most valuable historical records of the methods of planning and building dwelling-houses in the country at different periods, but they are examples, mostly, of simple and unpretending architecture, in which the effect arises from the natural disposition of the plan and the windows, and in which the details are in general those which were the vernacular of the country craftsman of the period.

About such buildings there is a great charm, and we entirely sympathise with Mr. Ditchfield in his love for them, and in his desire to collect illustrations of many of those which remain, some of which possibly may not remain much longer. But he writes a little too much like an antiquary, who sees in these old houses, because they are old, a charm which, it must be remembered, is to some extent the effect of time. All these houses were brand-new once; in most cases they were probably not regarded as picturesque nor intended to be so—by the men who built them. There are occasional exceptions to this (one or two of which we shall have to note); but in most instances they were practical house-building for a practical purpose, and if we could have seen them as they were when they were just finished, we should perhaps realise that a good deal of the glamour about them arises from the effects of weathering, and from the mere fact that they represent the work of a day long past, which has always an added interest of association. Nor can it be claimed that these simple houses represent architecture in the fullest sense of the word, or that, in admiring them, it is necessary to sneer, as the author does, at the great Elizabethan and Jacobean mansions. We shall continue, in spite of Mr. Ditchfield, to admire Wollaton and Burghley, and Hatfield and Longleat, and to think them worth more than many manor houses, with the advantage that we can admire both types of house in their several ways, while the author's devotion to the manor house seems to leave him no room for appreciating the mansion.

We regret to find, too, in Mr. Ditchfield's pages, the repetition of that gibe at the architect which is so common now among a certain class of dilettante writers, who would persuade us that in the (presumed) absence of the architect lies the secret of the charm of these old houses. The Tudor squire, he says, himself superintended the building, kept the accounts, and arranged the plans and the conveniences of the house according to his liking. "When we, in these days," says the author, "wish to build a house, we engage an architect. We tell him some of our ideas and vague notions, but we leave the whole matter in his hands. We order a house as we would order a motor-car or a portmanteau." Some architects, whose patience has been much tried by clients with "vague notions" which they were unable to define, but which, nevertheless, they were insistent on realising, would be only too glad if the client did in reality "leave the whole matter in their hands." But Mr. Ditchfield, with his evidently archæological turn of mind, forgets that the planning and designing of a house in the present day must comply with modern requirements of convenience and sanitation, and that it is much more of a scientific matter than it was in the days when the old manor houses were built. The happy-go-lucky method of carrying out a house after the whim and under the personal direction of the owner leaves it with the charm of naïveté, no doubt, besides that charm of age and weathering already referred to; but a modern owner who planned and sanitated his house no better than this would be laughed at and considered a "crank" by his friends who came to dine or stay with him. The days of naïveté in house-planning are past, except with some few architects who seem to think that small windows and buttresses in unexpected places will atone for any inconvenience in planning.

WEST BOWER FARM, NEAR DARLEIGH, WEST SOMERSET
(From "The Manor Houses of England.")

Apart from this prejudiced view of the subject the book is very well done, though the chapter on "The Evolution of the Manor House" sums up the subject rather too briefly, and with two few examples for so comprehensive a title. The view of Studley manor house, with its formal design and the roof concealed by a parapet, is effectively placed at the end of the chapter, as an example of the loss of character in this formal type of exterior for a small house, as compared with the earlier examples; though it is very likely a better house in interior design. But the real value of the book is in the amount of illustration of houses and workmanship in the following chapters on "Materials of Construction," "Exterior Details," and "Interior Details"; and Mr. Sydney Jones's sketches are excellent.

In treating of materials used, the author comments very well on the influence of material on the design and character of the house, at a time when materials were not sought for from a distance, and the sole object was to use them as well as possible for the work in hand. Among the stone houses illustrated, West Bower Farm, in Somerset, is one of those rather exceptional ones which seem to have been consciously designed to produce an effect, with its two octagonal turrets with windows round them in the upper portion, flanking the original entrance. We agree in thinking that the portion with a lean-to roof, whereby the entrance door is pushed out to the outer plane of the turret walls, is a later addition,

and a disfigurement compared with the probable appearance of the original building. This is a late fourteenth-century house, or perhaps early fifteenth, with pointed windows in the turrets. The plan has probably been too much altered to be worth giving in this case; but in a general way there are too few plans, the houses being mostly illustrated only as to their perspective effect. Oakley Hall, of the late domestic Gothic type, is an instance of that pleasing feature, the large mullioned window marking externally the position of the hall, which is almost a characteristic of the houses of this period. We should certainly have liked to have a plan of this house; also of Shipton Hall, in Shropshire, to have seen how the picturesque square tower works into the plan.

In the division on timbered houses one would have liked some more constructional details in addition to the charming sketches of various picturesque exteriors; in particular, a detail plan of one or two of the posts and the precise method of filling in between them (where brick was not used); though, no doubt, it would be difficult to get that without "making incision," in Touchstone's phrase. These timber houses look charming in sketches, and often in reality; but unless the posts and their filling were much thicker than seems generally to have been the case, they must have been must still be, where unaltered—very cold in winter. The author notices, in connection with Bradley Hall, the chimneys "wide at the base so as to afford a pleasantly large ingle-nook which is probably combined with an oven"; but we may suggest that this provision for the ingle-nook was possibly an indirect outcome of the timber construction, as providing a corner where one could, at any rate, be warm in frosty weather. The overhang of the upper storeys in this house, especially in the wing in which the overhang appears to be supported by the projecting bay beneath (a fancy so often adopted in the designs of modern architects), may perhaps be numbered among the features that were introduced for effect, since it is unnecessary in a house with plenty of open ground round it. In a mediæval walled city the overhang was a practical necessity, to get larger rooms without encroaching on the narrow street; but there sems no practical motive for it in the country. Possibly the general practice in the town originated the liking for it in country houses.

Among the brick houses illustrated, Barnham Broom (Norfolk) shows a piece of deliberately designed effect not arising out of the plan, in the two-staged octagonal turrets or buttresses at the angles of the entrance wing, with their odd little stone finials surmounted by a small cross. A few sketches of brick details from East Kent are interesting, as showing how much may be done with the ordinary square bricks. The house called "The Great Lyth," near Shrewsbury, seems to be a fine specimen of a completely brick house, but the outline of the gables, if seen in a modern house, would be thought very ugly. The illustration, however, may serve as a text for an exhortation on the superior effect of complete brick treatment over the medley commonly called "brick with stone dressings." This is not, of course, to condemn the use of brick and stone in the same building; but stone with brick filling is one thing; brick with stone dressing is another.

A good many good pieces of detail are illustrated in the sections on panelling, ceilings, and ironwork. In regard to the panelling, we do not see why the "linen pattern" should be praised merely because it is old. It is a poor and pointless way of decorating a wooden panel, after all, and was followed out everywhere at one time as an almost mechanical fashion.

The lesson to be learned from the study of the class of old houses illustrated and described in this book is the satisfactory effect that may be obtained from a simple treatment of buildings in a manner arising naturally out of the requirements of the building and the character of the materials used. But this is not to say that the same effect will be got by building in imitation of the old manor houses and taking them as models in a realistic sense; that would only be an archæological affectation. The requirements of the present day are different, especially in regard to plan. The one thing that remains the same is the good effect, especially in regard to stone buildings, of using the materials of the district, which are likely to harmonise best with the landscape. In these days of railway carriage, materials from a distance can be got at little extra expense; and in the case of large and palatial buildings, this may be often desirable and even necessary. But for smaller and more homelike houses, which are to form, as it were, part of the landscape, local materials will generally produce the best result.

THE OLD HALL, BARNHAM BROOM, NORFOLK.

(From "The Manor Houses of England.")

MAGAZINES.

The Fortnightly.

In the "Fortnightly Review" Mr. T. B. Firth has a thoughtful article on "Water Transport or Rail," of course in reference to the recent Report of the Royal Commission on Canals and Waterways. He sums up against the chance of making canals play any important part in transit in this country, in spite of their success in Germany and France. The conditions are different; we have not so much flat country nor such large rivers to supply the canals; and the replies from great trading associations as to the extent to which they would use a canal system, if 17 millions of public money had been laid out in developing it, were anything but promising. Canal traffic is very cheap in a sense, but it is very slow, and in modern trade supply it is increasingly the fact (and nowhere more so than in building operations) that time is money. Mr. Firth thinks that many of those who support the improvement of the canal system do so mainly in the hope that it will have the effect, by threatened competition, of lowering railway rates, "and the trader would then be the rejoicing third party."

Gazette des Beaux-Arts.

The "Gazette des Beaux-Arts" contains a long and important article, which we can only glance at here, on "Le Louvre et les Plans de Lescot," by M. Batiffol. Two

reproductions are given of Lescot's original plans for the Louvre. The main point of the article is that Lescot has not received credit enough for the general conception of the Louvre, of which he only carried out a portion. The author maintains that his portion is the part best constructed and carried out: "il est difficile de trouver bâtiments plus achevés, plus soignés dans le détail, que les siens. On sent qu'il a choisi chaque pierre: les joints sont invisibles; tout est demeuré svelte, cambré, intacte"; and the author compares this with the hurried building of the modern portions under Napoléon III. This article should be read by those interested in the history of French Renaissance work.

The Century.

"The Century" gives illustrations of four decorative paintings, symbolic of Law, painted by Mr. Blashfield for the Mahoning County Court House at Youngstown, Ohio. These are in the spandrels of arches, and in engraved form look very well, but we have aways felt Mr. Blashfield's design to be more favourably represented in black and white than in colour.

Harper's.

In "Harper's" Mr. Ford Madox Hueffer writes "Some pre-Raphaelite Reminiscences"—of Rossetti, Madox Brown, and others, which are interesting reading.

The Burlington.

In "The Burlington" is an article on and illustrations of "Ancient Peruvian Pottery," which is somewhat too grotesque to find its proper place in an art journal (indeed, Mr. Read, who writes the article, seems to think some apology necessary for it); it is of some interest, however, to find the Greek fret and the Greek wave ornament (as it may be called) in a crude form in this barbarous work. Two illustrations are given of the early mosaic of "The Discovery of the Body of St. Mark," in St. Mark's, Venice. The treatment of the architectural background in these is very curious and interesting.

The Antiquary.

This contains an illustrated article by Mr. A. C. Fryer on the interesting subject of "Fonts with Representations of the Seven Sacraments."

The Architectural Record (New York).

This is a very good number. Mr. Mowll's article on "Thought and Expression in Architecture" includes some remarks that are well worth serious consideration. The following we are specially struck with:—

The placing of the study of expressive construction at the beginning of our curriculum is at the bottom and root of all possible future progress in architecture. This step in certain schools marks the return to that method by which the world's greatest architecture was achieved. In Greece and in mediæval France there may very well have been no draughtsmen at all. The student got his construction at first hand, and was taught composition only in stone studies of his predecessors. A school with this basis is really an idealised office.

"Warehouses, their Planning and Construction," is a very practical article by Mr. C. H. Patton. There are sections of fireproof floors and methods of insulation used in the United States, and some illustrations which serve to show that warehouses might be made very effective pieces of architecture, but (as a rule) are not made so. The "Ice and Cold Storage" building at Cincinnati, for instance, wants very little to make it an impressive building; but that side of the subject is not gone into in the article. Mr. E. A. Bostock's article on "Glass in Building" is a summary of various forms and qualities of glass, with considerations as to their adaptability in respect of architectural effect.

PICTURE EXHIBITIONS.

The International Society.

As usual, the visitor to the exhibition of the "International Society of Sculptors, Painters, and Gravers," open this year at the Grafton, is greeted on entering with the sight of a headless figure by Rodin, a type of exhibit which seems to be the ensign of the society. In this case the figure is legless also—below the knee. Time was when it would have been thought an impertinence to the public to exhibit a mutilated statue. Now it seems, in some quarters at least, to be a *sine qua non*.

The exhibition is a curious medley of many things that are ugly in character and design, and muddy in colour, a few things that are powerful, and a very few that are beautiful. Amongst the latter, M. Aman-Jean's "Les Porteuses de Guirlandes" comes like a gleam of sunshine among the eccentricities and uglinesses by which it is surrounded. What possible purpose in art can be served by such a picture as Manet's "Ecce Homo," except to degrade the sacred subject down to the level of a vulgar realism, or what would be realism but that the nude body of the Christ is more like soap than flesh and blood. Mr. Strang's portrait of J. B. Clark, and his "portrait group," both in the large gallery, are no doubt painted with great and resolute force; but the vigour seems rather overdone. It is like writing in which every other word is underlined. Mr. William Nicholson's portrait of Lady Pearson is a fine and characteristic work, with that repose and harmony of colour which Strang's, in this instance, want; though no one can paint finer colour harmonies when he chooses. The numerous small studies of figures and other subjects by the late J. M. Swan, in the octagon room, are of much interest, and in their refinement contrast pleasantly with the coarse and vulgar character of some other figure studies in the same room.

In the Centre Gallery, Mr. Harrington Mann's portrait of a young girl, "Mona," is a clever and expressive work. Mr. Hornel's peculiar and individual style is somewhat crudely represented in "The Lily Pool"; we should doubt if this is a recent painting—he has done better than this latterly. Mr. Lavery does not help his high reputation by his picture "A Windy Day," in reality a large sketch in oils, with a very unsatisfactory sea covering a good deal of the canvas. Mr. Charles Shannon's "Autumn" is fine in conception and composition, but the nude figure is not a good design. His other work, "The Vintage," is one of a class of which he has painted a good many; a composition of nude figures which half evade the eye through the uncertain light in which they are seen. This is a kind of picture which aims at being ideal and poetically suggestive. It is difficult to say exactly why it fails to be so, unless it be that there is too much of a kind of conscious intention to be poetical; perhaps, also, that there is a want of dominating *motif* in the composition. Mr. Cameron's "The Marble Quarry" is really powerful in composition and in "values"; but his pictures always seem to remind us that he is essentially a black-and-white artist, not a colourist. M. Le Sidaner's "Hampton Court" in evening light is a very good example of his special talent; it has, we think, been exhibited before in London.

In the end gallery is a good painting of Albi Church, by Mrs. Dods-Withers, but why show this southern church under so gloomy a light? Among other things to remark in the end gallery are Mr. Harold Speed's portrait of Mr. Holman Hunt, and the same artist's painting of "The Parthenon at Night"; Zuloaga's unlovely portrait of a low-looking woman, which people pretend to admire because Zuloaga is a fashion; Mr. Nelson Dawson's "Broken Weather—English Channel"—broken with a vengeance, both sea and sky a mere mass of scumble; and Mr. A. G. Walker's pretty sculpture relief, "Motherhood."

There are various good bits of landscape scattered about, but nothing remarkable; and, as a whole, the exhibition is one which contains little to please and a good deal to exasperate the visitor.

The Goupil Gallery.

At this gallery is an interesting exhibition of paintings, chiefly landscape, by Mr. W. W. Russell, an artist with a great deal of power in pourtraying effects of light in landscape, who injures his own effects sometimes by an unnecessary rough handling and an apparent indifference to composition. "The Great Heath" is quite spoiled by the ragged nature of the foreground, and "Poole Harbour" the same. "Donkeys and Kites" we do not call a picture, for there is no composition whatever in it, but it is a brilliant piece of open-air effect. "The Picnic," however, has the making of a fine picture in it. The best of the oils is perhaps the one which hangs alone among the water-colours—"The Home Farm." Mr. Russell belongs to the New English Art Club section of painters, and seems, in painting figures, to share their general dislike to painting faces as nature makes them. "Near the Window" would be an attractive picture if only the girl's face looked like flesh and blood, but it does not; the shape is there, but the material might be putty.

The Carfax Gallery.

The collection of the Carfax Gallery, a medley of small works, including some very good things, even among those which are palpably imitations of an old style. Mr. Dechanne's "Healthy Ground Pond" and "Landscape with Cloud," might, for their style, have been painted in the eighteenth century, but they are beautiful little works. His "View of Oxford" is an imitation of Girtin; good as such. Mr. Rich's sketches of "Shoreham" and "Near Selsey," and Mr. Claude Tryon's of Walmer Town Hall are good. Mr. Neville Lytton's "Clare College" is out of perspective: he exhibits a good crayon portrait of a lady. The modern clavichord, decorated by Mr. and Mrs. Neville Lytton, is good as far as the minor decorative detail is concerned, but the procession of rather stiff-looking white horses on the inside of the lid is hardly decorative, nor has it any relation to the purpose of the instrument.

FOREIGN NOTES.

The Gran Via, Madrid.

The King inaugurated the Gran Via, Madrid, on April 4th, in the presence of the Royal family, the civil and military authorities, and an enormous assemblage of the general public. The Gran Via, or Broadway, will form a thoroughfare connecting the central part of the town with the north-west quarter, hitherto isolated from the rest of the city by a labyrinth of narrow streets, and will thus provide an outlet towards the Northern Railway Station and the magnificent new park of the Moncloa. The scheme, which a group of foreign capitalists have undertaken to execute, involves the razing of many houses and the disappearance of 14 streets. The new road will be divided into three sections. An avenue, 27½ yards broad, will extend from the Plaza de Leganitos, at the head of the main street coming from the Northern Station, to the Plaza de Callao; a boulevard, 38½ yards wide, will continue thence to the Red San Luis; and another avenue will lead to the Calle Alcalá, terminating near the historic church of San José. The total length will be 1,446 yards, and the cost is calculated at about £1,850,000. The contractors are to receive a monopoly, lasting 40 years, of the electric light supply for the houses bordering the new road and of the tram lines running along it. The work is to be completed in eight years. The razing of a great number of old-fashioned houses and the admission of more light and air to the populous central quarter of the city, will mark another step in the transformation of Madrid into a modern city.

HOUSE AT CHURCH STRETTON, SHROPSHIRE. ERNEST NEWTON, F.R.I.B.A., ARCHITECT.

The request for back numbers of "Details," all rights in which publication have been acquired by the Proprietors of "The Architects' and Builders' Journal," have been so numerous that it has been decided to republish selected plates in this paper. This house is built on the south side of a hill, the slope of the ground being favourable to the formation of a terrace garden The walls are of local bricks, covered with rough-cast, and the roofing is of hand-made tiles. Between ground and first-floor windows the bay is covered with sheet copper with welted joints. At present the copper is a dull reddish brown colour, but it will eventually acquire a green patina in the pure air of the Shropshire hills. The terrace walls are of common bricks, built with a wide recessed joint, and are intended to be covered with creeper.

OBITER DICTA.

Status. The architectural profession would never obtain a status before the public until they had an established status as an adequately trained and properly educated body. The facilities for architectural education in the provinces should be second to none.—*Mr. J. P. Hynes, of Toronto, speaking at the second general annual assembly of the Royal Architectural Institute of Canada.*

Exciting Spade Work. Antiquarian digging on ancient sites is a gamble on a large scale. Nothing can be more exciting. The spades go in, say, on the turf of Cnossos, and you do not know what will come out. Mr. Evans did know that plenty of writing older than the oldest Greek alphabet would come out, but could not anticipate the marvels of his actual discoveries, a whole lost and forgotten civilisation. Even amateur digging in a Roman villa in a garden has some excitement, but the Romans were so stereotyped in their ways that nothing novel can be expected.—*Andrew Lang, in the "Morning Post."*

A Necessary Abomination. The erection of another huge block of tenement dwellings will give rise to grave questionings. Is it really a satisfactory way of solving the housing problem to pack people neatly on shelves one above the other like goods in a shop? Frankly, the tenement dwelling is of itself an abomination, but unfortunately in a city the size of London it is a necessary abomination. With a population of several millions all demanding daily access to a comparatively limited area the possibility of horizontal extension is limited, and the accommodation must expand vertically. By some arrangement the housing in the inner and middle zones of London must be made decent, and for that purpose the tenement dwelling is the best. All its drawbacks are nothing to the horrible results of crowding several families into buildings designed for a single household.—"*Morning Post.*"

This is in the new wing, the floor and panelling being of oak.

LYMPNE CASTLE, KENT: THE SMOKING-ROOM. R. S. LORIMER, A.R.S.A., ARCHITECT

LYMPNE CASTLE, KENT.

Though there be those extremists who might without much injustice be accused of a morbid appetite for picturesque decay, who seem to love dilapidation and ruin rather than decent weather-tightness and the general conditions comformable thereto, these people, it may be presumed, are but the ultramontanes who seem to be inseparable from every cult and creed. Yet it is the man in the middle distance who counts. He does not object "on principle" to restoration. Rather, it is with him a principle that not only should decay be arrested, but that a venerable building that is in danger of dilapidation should be so "restored" as to be maintained in utility and strength without detriment to its architectural character.

Photo: T Lewis.

LYMPNE CASTLE, KENT: THE TOP OF THE STAIRCASE. R. S. LORIMER, A.R.S.A. ARCHITECT.

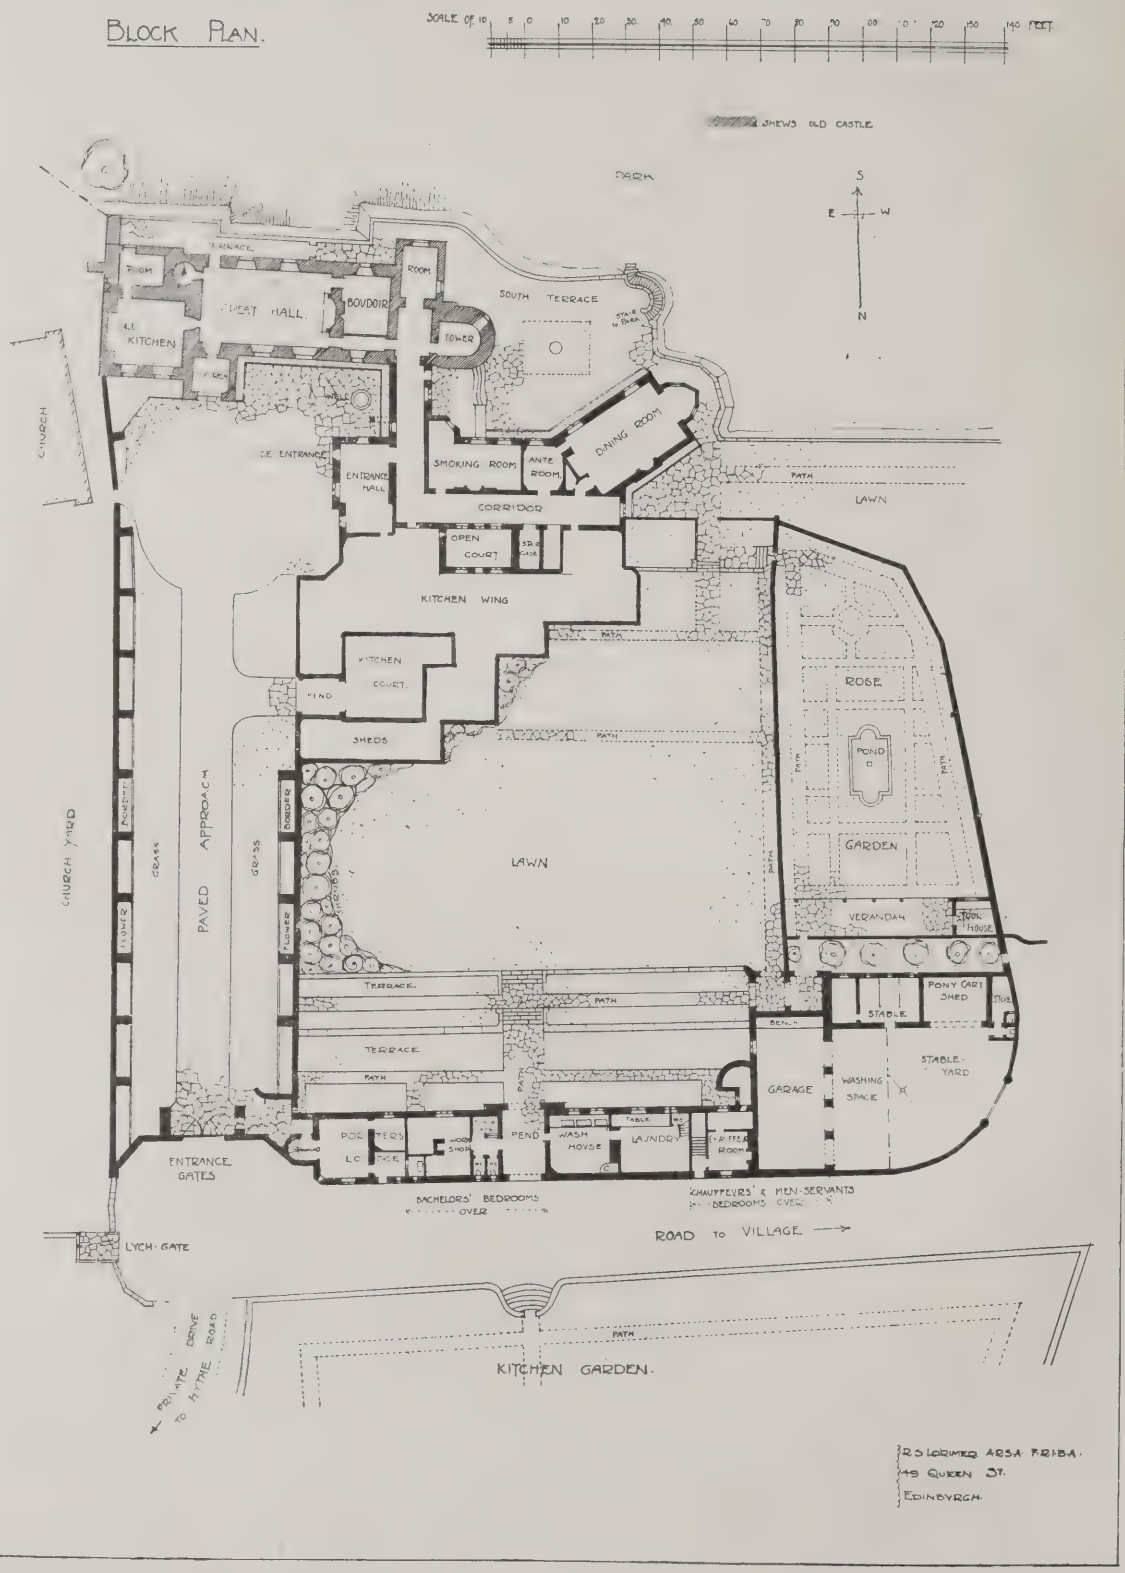
This rational view is, it may be assumed, completely satisfied in the work which Mr. R. S. Lorimer, A.R.S.A., has carried out at Lympne. He had to deal with a building that is said to have been erected in the reign of Henry V., although there are no remains that can be certainly ascribed to an earlier date than the reign of Edward VI. For probably eighty years past it had been used as a farmhouse, and had suffered considerably in the adaptation to this purpose. Moreover, Mr. Lorimer found the structure in a dangerous and almost ruined condition. The area comprised farm sheds, cattle courts, barns, etc., and these buildings had to be demolished. New buildings put up on the north comprise the porter's lodge, workshop, washhouse, laundry, chauffeur's quarters, garage, stables, and store. On the first floor of this range are some bachelors' bedrooms, and over another part are bedrooms for the chauffeur and men-servants. The principal additions, beside the kitchen wing, comprise a new dining-room, ante-room, smoking-room, entrance hall, and connecting corridor, with the necessary bedrooms. A new entrance gate has been built, with a paved approach to the house, a screen wall against the churchyard, and screen walls to the garden.

In how scholarly and sympathetic a way the work has been accomplished may be inferred from the illustrations. The idea in the design of the additions to the old castle was to make the connection by a narrow neck only, "so as to leave the old building standing by itself to tell its own story."

The stone required for the building was almost entirely quarried on the spot; and it was found in sufficient abundance to provide the material for paving the old Gothic Court, for forming a paved terrace to the south, and for stoned paths to the gardens.

The new roof to the old hall is of of modern oak, only one tie-beam of the original roof having been found. The linen-fold panelling and the floor are also of oak. The new dining-room ante-room, and smoking-room, are also panelled in oak, and have oak floors.

Photo: T. Lewis.



The castle is situated on the edge of a great tableland. The steep bank slopes down ultimately to Romney Marsh, and on a clear night the lights on the coast of France are visible.

FIRE PREVENTION NOTES.

Fireproofing Existing Buildings. Although in this country we have unfortunately had considerable experience of wholesale destruction of property and lamentable loss of life by fire, it must be acknowledged that in this respect we cannot compete with the United States of America. It must also be acknowledged that neither can we compete with them in the aptitude for learning useful lessons from such disasters. We are told that it is now fully realised by American traders that the proper safeguarding of goods against fire is the very life of trade. "The public and the trade [warehousing] are demanding every possible convenience, every possible safeguard against loss of life, loss by fire, or by other means of destruction." The "Architectural Record" (New York) for April, in a special article on the planning and construction of warehouses, suggests that, with regard to existing premises, these demands may be met, in a large number of instances, by (1) sub-dividing great areas by brick firewalls; (2) by properly protecting vertical floor-openings, such as those for elevators and stairways; (3) by added protection from outward exposure; (4) by separating the common from the hazardous commodities; and (5) by providing the premises with an approved automatic sprinkler equipment. In this way fire risk could be reduced to a minimum.

Modern Methods. In the above-mentioned article, only two general types of structure are deemed worthy of special mention as being suitable in all respects for a modern standard warehouse. The premier position is given to "the modern fireproof building, a protected steel skeleton building having brick walls, tile or reinforced concrete floors without wood surface, similar partitions and roof, without interior or exterior wood trimming or framework. This includes standard shafts with fire coverings for elevators, stairways, and all vertical openings; also the proper safeguarding of outside wall openings from exposure. Our contemporary, while obviously favouring the steel-frame structure with tile or concrete insulation, concedes that reinforced concrete, when its form and practice are standardised, will hold its own with the protected steel-frame type, at heights practicable for its use. The great recommendation of the modern fireproof building of America appears to be that it has no general limited restrictions as to height, such as govern structures of mill or joist types. The greater the height of the building, the more carefully considered should be "the question of limitation of individual area." This is more particularly the case with respect to the vertical opening hazard, such as openings and stairways; the large areas and unprotected vertical openings being largely responsible for the extensive damage from fire in fireproof buildings. "Combustible goods will burn, whether stored in a fireproof or frame building. Fire will destroy anything, give it enough fuel, draught, and continuous lines to follow, but confine it within a limited space, within non-combustible enclosures of proper resistance quality, and the damage beyond that to the combustibles therein, usually will be nominal. It is wise, however, not to exceed eight storeys in height, nor to go beyond a floor area of 10,000 sq. ft. for warehouses. The area, in fact, should be no greater than 5,000 sq. ft. without standard fireproof partitions," but with an approved automatic sprinkler equipment the area may reach a greater limit in "individual instances."

A Model Fireproof Building. The compactly built property of the Pittsburg Terminal Warehouse and Transfer Company, Pittsburg, Pa., is cited as an example of effective area limitation. The building is divided by five walls into more than seventy vertical fire sections of six storeys each, their dimensions averaging 20ft. by 158ft., or 3,200 sq. ft. for each room, forming about 400 separate fireproof compartments. The building comprises a basement and six storeys. The elevators and stairways are in fireproof shafts, cut off at the various floors by automatic operating fire doors The premises are equipped with automatic sprinklers, other auxiliary fire protection, and excellent watchman patrol service. This building is certified by the chairman of the Committee on Construction of Buildings, National Board of Fire Underwriters, as being "of the most thoroughly fireproof nature that has come to his attention."

Faulty Construction. The writer goes on to contend that extensive fire losses in mill-constructed buildings are largely due to faults in the buildings themselves. For example, it is often found that the elevator and stair shaft is far from standard; that the fire doors to openings are but makeshifts, or the owner has permitted an open stairway or chute to pierce two or more floors. Perhaps the elevator walls do not extend through the roof. The floors are not waterproof, and no scuppers are provided. The height and the areas are too great. The area permitted is too great. The beams and girders are improperly set. There is deviation from the proper wall thickness. Heating, ventilating, and lighting systems are improperly installed. Division walls are of less than standard thickness, and the fire doors over openings are not of approved type, while the building is perhaps not properly protected from outside exposure. These are some of the features that, even in America, where fireproofing has made a near approach to an exact science, are neglected, sometimes with disastrous results; and the enumeration of these points will probably be useful to British builders, who are paying ever-increasing attention to fire-prevention methods of construction.

Photo: G.P.P.

This fire illustrates the danger in grain stores of the swelling of the grain fom the water played on the building, which burst out the wall. The resistance of the heavy timber bearing is noteworthy.

THE FIRE AT A GRAIN STORE IN ODESSA STREET, ROTHERHITHE.

Cinematograph Shows. It is rather doubtful whether cinematograph buildings are not becoming more numerous than skating rinks. The former are certainly springing up in every direction; and since very many are being hurried on towards completion, it follows that the case heard last week by Mr. Hopkins, at the Lambeth Police Court, raising as it did an important point, is of more than ordinary interest. The summons was taken out by a district surveyor, who charged the manager or proprietor of the Old Kent Picture Palace, Old Kent Road, with having used that building "before the district surveyor or the Tribunal of Appeal had declared his or their approval of the construction thereof." There was also a summons against Messrs. W. Townson and Sons, Ltd., builders, of Bolton, "for failing to comply with a notice of irregularity served upon them by the district surveyor." In opening the case, counsel stated that under Section 78 of the London Building Act, public buildings were in the absolute discretion of the district surveyor, who made such require-

ments as he thought fit, subject to the builder's right of reference to the Tribunal of Appeal. Until January 1st of the present year, the district surveyor had sole jurisdiction over such buildings as these, and up till then a proprietor was entitled immediately to open the place upon getting the certificate of the district surveyor; but on that date the Cinematograph Act came into operation, making it necessary to obtain a licence from the London County Council, subject to such conditions as the Council might think fit to make.

Conflicting Authorities. From counsel's statement Mr. Hopkins, the magistrate, gathered that the position is this: The district surveyor has made certain requirements. These have not been complied with; and, notwithstanding those requirements, and in face of them, the L.C.C. have given the owner a certificate to open a cinematograph show. In spite of that certificate, the district surveyor is insisting upon his alterations. Counsel here interjected that "The certificate given by the Council is a personal one to the man, and has nothing whatever to do with the construction of the buildings." Mr. Hopkins said, "That is carrying it too far." Counsel submitted that the authority of the district surveyor was absolute under section 78, and that his worship was bound to make an order for the work to be carried out. He suggested that the province of the Council was to deal with the seating arrangements and the use of inflammable films, and that the Cinematograph Act was not intended to apply to the structure at all, but to things which were not dealt with by the district surveyor. Mr. Hopkins commented: "It is the old story of the owner and the builder having to suffer because of the conflict between one authority and one person who says he is the authority." Without calling upon the defence, he dismissed the summonses, with £5 5s. costs against the district surveyor; and in doing so, he expressed the hope that some day some tribunal would define the status of the district surveyors in cases where, in their view, their jurisdiction clashed with that of the County Council.

Irreconcilable Restrictions. For this eminently commonsense view of the situation, builders will be duly grateful. But the root of the evil is still in the ground, and is likely to send up shoots in other directions. We have long suffered from conflicting laws and by-laws. A further point is that apparently the builder is often called to account where he has simply obeyed the orders of the owner or the architect. It is surely not just that he should be made to suffer for another's fault, and that he should be saddled with responsibility for matters over which he has no control. That, however, is another story. The lesson immediately derivable from the present case is that the laws and by-laws affecting buildings are still sadly in need of consolidation and codification. At least they should not be so mutually independent or antagonistic as to place the unhappy builder betwixt the upper and the nether millstone.

SOCIETIES' REPORTS.

Royal Institute of the Architects of Ireland.

An ordinary meeting of the Council of the above body was held at 31, South Frederick Street, Dublin, Mr. R. Caufeild Orpen, B.A., occupying the chair, in the unavoidable absence of the President. Amongst the members present were: Messrs. C. H. Ashworth, L. O'Callaghen, F. Hayes, G. Sheridan, A. Millar, G. Beckett, H. Allberry, J. H. Webb, and C. A. Owen, hon. secretary. The correspondence having been dealt with, a communication from the Stonecarvers' Trade Association with regard to the encouragement of the trade was considered, and the Council expressed themselves generally in favour of the association's proposals. The amalgamation of the Architectural Association and the Institute was further discussed, and a proposal to erect a memorial to the late Sir Thomas Drew was under consideration.

The Junior Institution of Engineers.

A visit of the Institution was recently paid to the building in course of erection for the Royal Automobile Club in Pall Mall. Messrs. Mewès and Davis and Mr. E. Keynes Purchase are the associated architects. [The design and plans were given in the "Builders' Journal" for April 21st, 1909.] The work is being executed by Messrs. Waring and White (1906), Ltd., Mr. S. Bylander, their Engineer, Mr. B. Tarring, Superintending Engineer, and Mr. A. F. Alden conducted the members round

The length of the front is 228ft., and the average depth 242ft. There are two storeys below the ground floor and five storeys above, in addition to the ground floor storey, making eight storeys in all above the basement floor. A swimming bath will be constructed in the basement 86ft. long, 30ft. wide, and maximum depth 8ft. The foundations under the swimming bath are 41ft. 6in. below ground floor. The building is constructed practically as a steel frame, all loads being carried on columns up to the first floor or second floor level, except the party walls between the club building and the adjoining building, which is self-supporting. The thicknesses of the walls are all in accordance with the old Building Act. The front and back walls are carried on steel girders at the first or second floors, and are self-supporting above that level. The floors are constructed in reinforced concrete. All the steelwork is cased with at least two inches of concrete. The interior partition walls are built with 2½in. and 4in. thick pumice concrete blocks. The retaining wall supporting the street at Pall Mall front is constructed in ordinary concrete, and the retaining wall at the back of the building is constructed in reinforced concrete—the height of this wall is 38ft. The swimming bath is also to be constructed in reinforced concrete. Triple web-plate girders 3ft. deep are placed at second floor level over large rooms to carry part of building above, and two of these girders weigh 24 tons each. The columns are all made of built-up sections of angles and plates. The girders are generally steel rolled joists, plate girders being used only for special long spans and heavy loads. The distance between the floor beams is generally about 12ft. The front and back walls are faced with Portland stone, and the elevation to Pall Mall is expected to be one of the most artistic in that street. The basement, lower ground floor, ground floor, and first floor will be partly ventilated and heated by means of hot air; in addition, the entire building will be heated with hot-water radiators. All the drainage above lower ground floor will discharge direct into the sewer through pipes suspended under the lower ground floor. The waste water collected in the lower ground floor and the basement will discharge into the ejector chamber 40ft. below the ground floor level, and by means of ejectors the water will be raised to the sewer level. These ejectors will also be used for emptying the swimming bath. Complete drawings are made of the steelwork, showing all connections and the position of all rivets. The work is accurately set out in the shops as well as on the site to facilitate quick erection. At the conclusion of the inspection, on the proposal of Mr. Jas. Oswald (member of Council), a vote of thanks was passed for the facilities which had been given enabling the members to inspect such an interesting example of constructional engineering work.

Photo: G.P.P.

The damage is estimated at £40,000. The bursting out of the walls, due to the pressure of the grain, suggests the employment of monolithic construction in these buildings.

RIVER FRONT OF THE GRAIN STORE IN ODESSA STREET, ROTHERHITHE.

Builders' Clerks' Benevolent Institution Dinner.

The 32nd annual dinner of the above institution was held on Tuesday, the 5th inst. in the King's Hall, Holborn Restaurant, W.C.

The President (Mr. Wm. Downs), in proposing the toast "The Builders' Clerks, Benevolent Institution," observed that the society had been in existence for 44 years. The institution only gave £24 per annum to their pensioners, which was small in comparison with sums paid by some of the other societies. Relief had been given in the first year amounting to £12 15s.; last year payments amounted to £800. They had at the moment thirty pensioners. It had unfortunately been found necessary to draw upon the invested funds to the extent of £300.

Lieut.-Col. Trollope, in proposing the toast "The Architects and Surveyors," thanked the architects for their support, both by their presence and their donations. London buildings, he continued, reflected great credit upon English architects, and formed a striking contrast to the work of the mid-Victorian period. The surveyors dealt with the more practical side of the business, and although builders had to put down ridiculously low figures nowadays, it was not the fault of the surveyors.

Mr. William Woodward, replying for the architects, thanked the previous speaker for his kind tribute to architecture. If Mr. Belcher had been present, he (Mr. Woodward), with the modesty that characterised all architects, would have declined to speak. Architects, he continued, were poets, and architecture was poetry in stone.

Mr. Stanley Chatfeild Clarke responded for the surveyors, and observed that if the large West-end firms continued supplying houses at so much per room, surveyors would have to start a benevolent institution of their own.

Mr. F. S. Oldham proposed the toast "The Builders and Bunders' Merchants." He had spent all his life in the building trade, he observed, and, during the 21 years he had spent on the committee, had seen many of the finest contractors.

Mr. W. F. Wallis, in responding for the builders, said, as builders, they could congratulate themselves upon being members of no mean calling.

Mr. A. Ritchie replied for the builders' merchants, and urged all Englishmen to emulate the example given by Berlin, and acquire a thorough technical education.

NOTES ON COMPETITIONS.

Acton School Competition.

Members of the Royal Institute of British Architects are requested not to take part in the above competition.

By order of the Council,
IAN MACALISTER, Secretary, R.I.B.A.
9, Conduit Street, London, W.
April 6th, 1910.

Blyth Secondary School Competition.

Mr. J. A. Gotch, F.R.I.B.A., F.S.A., the assessor in the above competition, has made his award as follows:—

1st Premium (£50), Mr. Edward Cratney, Wallsend-on-Tyne.

2nd Premium (£30), Messrs. W. and T. R. Milburn, Sunderland.

3rd Premium (£20), Messrs. Shewbrook and Hodges, Newcastle-on-Tyne.

LIST OF COMPETITIONS OPEN.

APRIL 23. COUNTY OFFICES, NAVAN. Particulars given in our issue of March 16th.

MAY 31. MUNICIPAL OFFICES, KARACHI. Particulars given in our issue of March 16th.

JUNE 11. COVENTRY. ENLARGEMENT OF SCHOOL at STOKE. Limited to Architects practising in Coventry. Particulars given in our issue of March 16th.

JUNE 15. ELEMENTARY SCHOOLS, ACTON. Particulars given in our issue of March 16th.

AUGUST 31. COVENTRY. NEW ELEMENTARY SCHOOL in Centaur Road. Limited to Architects practising in Coventry. Particulars given in our issue of March 16th.

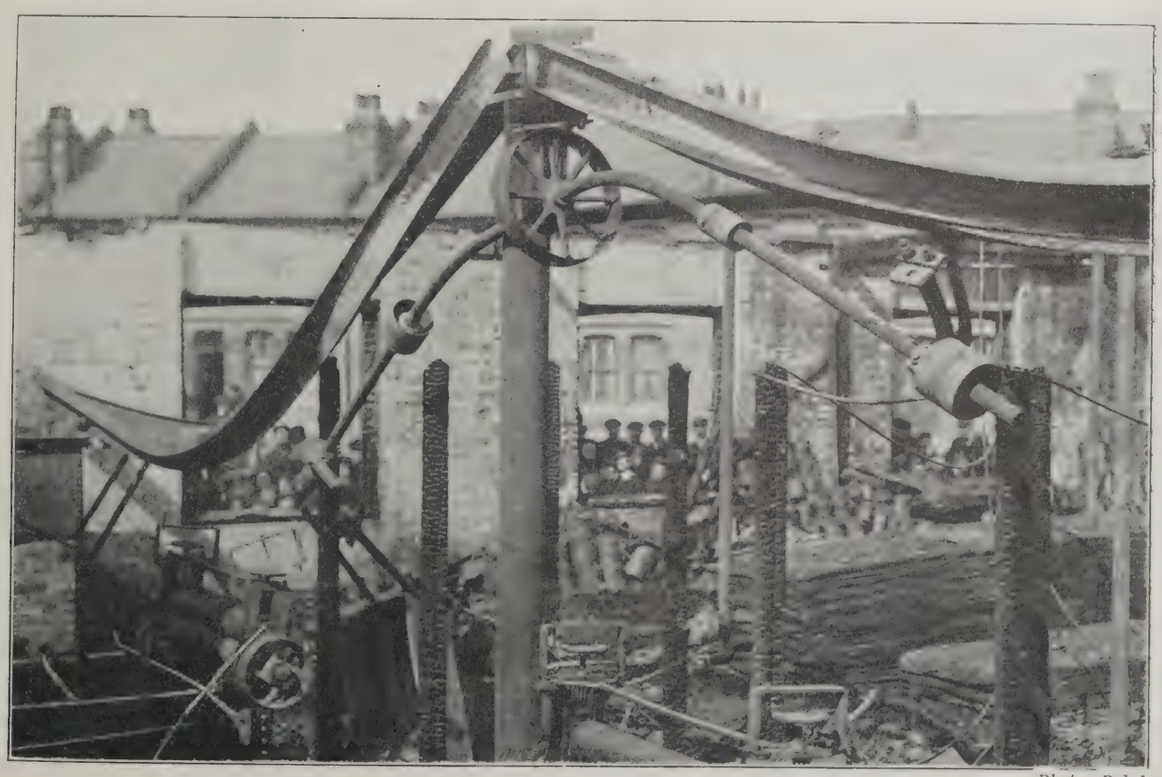
NO DATE. BIRKENHEAD CHILDREN'S RECEIVING HOME, at the Union. The Guardians invite architects residing within the limits of the Birkenhead Union to submit designs for a proposed Receiving Home for Children in Birkenhead. Premiums are offered to those three architects whose plans are selected. Conditions and instructions may be obtained from John Carter, Clerk to the Guardians, Poor Law Offices, Birkenhead, on application by letter only.

TRADE AND CRAFT.

Siemens O.S. Wiring System and Electric Light Fittings.

In our last issue, the names and addresses of Messrs. Siemens Brothers and Co., Ltd., and Messrs. Siemens Brothers Dynamo Works, Ltd., were, by a printer's error, interchanged on the respective advertisements of these two companies on pages xxxii. and xxxiii. As this accident may have caused some unnecessary correspondence between our advertisers and readers, we wish to make it clear that Messrs. Siemens Brothers and Co., Ltd., are the manufacturers and suppliers of the O.S. wiring system referred to on the advertisement in question, and that the component parts of this system are "Stannos" wires and "Balkos" conduits, which may be used either separately or in combination, depending on whether the wiring is solid or drawn in. "Stannos" wires are indiarubber-covered conductors, surrounded by a homogeneous and watertight metal sheathing. They are semi-flexible, neat, and comparatively inexpensive. When fixed on the surface of walls "Stannos" wires are particularly unobtrusive; and if used for sunk work, they involve a minimum of cutting away of plaster and joists. For the above reasons "Stannos" wires are specially suitable for places where the decorations are valuable and ornate, particularly in old country houses. "Kalkos" consists of light gauge tinned brass tubing and boxes, and it is claimed to be the only draw-in system in which the insulation of the wires does not corrode (because moisture does not condense in them), and the only one which has an absolutely reliable electrical continuity. Both "Stannos" wires and "Kalkos" conduits can be used on the concentric system, that is, with the sheathing or the tubing respectively used as an earthed return conductor, involving half the amount of wire.

Messrs. Siemens Brothers' Dynamo Works, Ltd., are dealing extensively with all classes of electric light fittings, and are supplying effective period fittings of the Adam, Elizabethan, Georgian, Louis, and Empire styles. One of their specialities, the "Majolica" fittings, is composed of a cream porcelain shell, gilt-lined, mounted on a polished mahogany or white wood base, which carries the lamp-holder. Another special type of fittings supplied by Messrs. Siemens Brothers' Dynamo Works, Ltd., is the "Tantalum" arc, in which "Tantalum" lamps are arranged in clusters underneath holophane reflectors, so as to make up one complete fitting. The reflecting and dispersing properties of holophane glassware account for a very uniform distribution of the light in a downward direction, whilst glare is entirely eliminated. The company also deal with standard types of wall brackets, hall lanterns, and electroliers, which are stocked in a large variety of antique brass, polished brass, oxidised copper or oxidised silver, and they have numerous designs of watertight, waterproof, and electric fittings for exposed positions, etc.



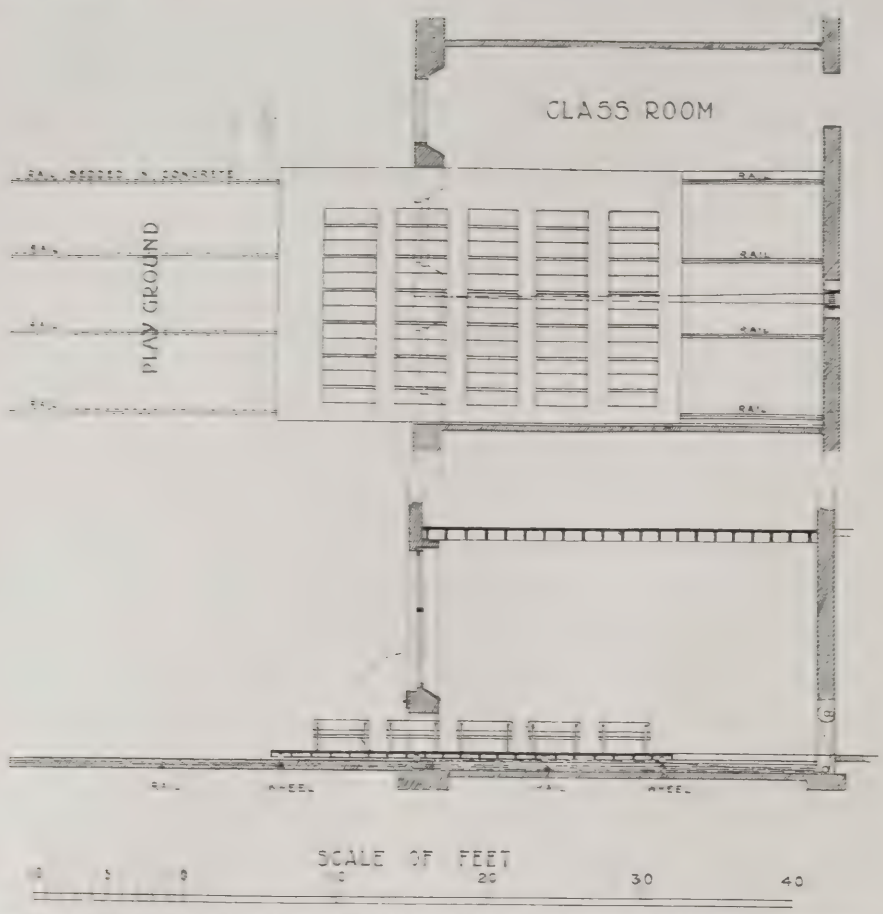


Photo: Bolak.

The roof was destroyed owing to the failure of the steelwork, which can be seen twisted in an extraordinary manner.
FIRE AT THE WORKS OF VULCANITE, LTD., STOUR ROAD, OLD FORD.

PLAN AND SECTION OF PATENT FLOOR FOR OPEN-AIR TEACHING. INVENTED BY THOMAS BAIRD, F.R.I.B.A., I.A.

PORTABLE FLOORS FOR OPEN-AIR TEACHING.

The open-air teaching of school classes seems to be emerging from the experimental stage, and is likely to become an established practice even in this precarious climate. There are, of course, other difficulties; and the special conditions give rise to special requirements. The chief difficulty is probably that of the speedy and convenient transferring of scholars' desks, etc., out of school and in again. This particular difficulty has now been met by constructing the classroom floor in the form of a portable platform, mounted on anti-friction wheels, so that the floor and desks can together be almost instantly wheeled out and in. Rapidity in effecting this change is essential, because even during the best of weather, thunder showers come with little or no warning. Instant removal can be readily and cheaply accomplished, and with little or no confusion, by constructing that part of the floor on which the desks are fixed in the form of a movable platform, running on anti-friction ball-bearing wheels resting on rails underneath, the rails extending through the outer wall of the classroom into and level with the playground as far as necessary. The movable platform or floor could be easily pushed out and in by hand, or it could be wrought by a light wire rope or chain over pulleys attached to a winch secured to the wall, and carefully boxed in so that it would be impossible for anyone to be injured. To permit of the floor, together with the desks, being wheeled out of and into the classroom, the outer wall, for the necessary length, is bridged over with beams, below the window sills, at a sufficient height to allow of their convenient passage. The opening in the wall through which the floor and desks pass would be closed, when not in use, by hinged doors closing in a water-tight barge-board, or by sliding-doors running on anti-friction rollers. Any difference of the levels of the playground with the floor of the classrooms can be overcome by lengthening or shortening the supports on which the wheels carrying the floor are fixed, or the playground immediately around the school could be raised for the necessary width to the level required with steps down to the level of the playground proper. Where the foregoing system may happen to be unsuitable to existing conditions, a permanent light guard rail could be fixed round the edge of the movable part of the floor, to prevent the children falling from it when the level of the playground was some little distance lower. In the majority of cases, however, the level of the playground could easily be made suitable without any special arrangements. The opening in the outer wall through which the floor passes extends only for the necessary length, and the remaining portion of the wall has a casement window in it, opening down to the floor level to permit of the ready egress and ingress of the scholars, and also for the blackboard being wheeled out if necessary.

The method described would be applied to the ground floor only, as it will be evident that any such system applied to the upper floor would be both expensive and dangerous, and would practically destroy the effect of the ground floor arrangement. The difficulty of the upper floor could be overcome by admitting the outer air into the school to such an extent as to render the indoor conditions as nearly as possible equivalent to those of the open-air. One method of accomplishing this is by forming almost the whole outer wall of the classroom of casement windows, to open inwards like doors, and so practically remove, for the time being, the whole outer wall. An objection to that system is, that so much glass would cause the classroom to be very cold, or would so materially increase the cost of heating power and fuel as to render such a system undesirable. Hence it might be sufficient and better, all things considered, to fit the usual windows with hinged casements, opening down to the floor level with fanlights above, made to open to the horizontal so that they would offer, when open, no obstruction to the outer air, and would be always available for ventilation in the usual way. The hinged casement would be a further advantage for cleaning the windows. The openings left exposed by the windows, being hinged in, would be made safe by simple collapsible gates fitted to the stone rebates on the outer side of the casements. Further, to perfect this system, the walls could be reduced to the minimum height allowed by the Educational Department, and the roof left open to the apex, and plastered inside to comply with departmental requirements; and on the ridge or apex of the roof there could be an almost continuous ventilator made to open upwards to the vertical, and so be practically equivalent to temporarily removing part of the roof and leave the classroom directly exposed to the sky. All these suggestions have been put forward by Mr. Thomas Baird, Jr., F.R.I.B.A., I.A., architect, of 134, Bath Street, Glasgow, who is the inventor and patentee of the portable floor described.

COMING EVENTS.

Wednesday, April 13.

ROYAL SANITARY INSTITUTE. — Mr. H. Percy Boulnois on "Scavenging; Disposal of House Refuse." 7 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Annual Business Meeting. President's Valedictory Address. 8 p.m.

INSTITUTION OF CIVIL ENGINEERS.—Students' Visit to Kempton Park Filter Beds and Pumping Station of the Metropolitan Water Board.

Thursday, April 14.

R.I.B.A.—Science Committee meets.

SOCIETY OF ARCHITECTS.—Mr. S. Bylander on "Constructional Steel Work," 8 p.m.

ILLUMINATING ENGINEERING SOCIETY.—Discussion on The Measurement of Light and Illumination will be continued, 8 p.m.

INSTITUTION OF MECHANICAL ENGINEERS.—Anniversary Dinner, Hotel Cecil.

PAINT AND VARNISH SOCIETY.—Mr. Gaston Depierres on "Zinc Oxide," 8 p.m.

Friday, April 15.

SOCIETY OF ARCHITECTS.—Annual Dinner. Holborn Restaurant, 6.30 p.m.

INSTITUTION OF MECHANICAL ENGINEERS.—Adjourned discussion on Mr. G. Hughes's paper, "Compounding and Superheating in Horwich Locomotives." Mr. S. N. Brayshaw on "A Research on the Hardening of Carbon and Low-tungsten Tool-steel," 8 p.m.

Saturday, April 16.

R.I.B.A.—Issue of nomination papers for election of Council and Standing Committees.

Monday, April 18.

INSTITUTE OF SANITARY ENGINEERS.—Paper by Mr. A. Alban H. Scott, 8 p.m.

R.I.B.A.—Professor W. R. Lethaby on "The Architecture of Adventure," 8 p.m.

ROYAL SOCIETY OF ARTS.—(Cantor Lecture). Mr. A. B. Searle's Second Lecture on "Modern Methods of Brickmaking," 8 p.m.

LIVERPOOL ARCHITECTURAL SOCIETY.—Annual General Meeting, 8 p.m.

ARCHITECTURAL ASSOCIATION.—Play, "Arctia," Royal Court Theatre, London.

Tuesday, April 19.

R.I.B.A.—Practice Committee meets.

ARCHITECTURAL ASSOCIATION.—Play, "Arctia," Royal Court Theatre, London.

Thursday, April 21.

R.I.B.A.—Literature Committee meets.

ROYAL SOCIETY OF ARTS (Indian Section).—Mr. J. Claude White on "The Arts and Crafts of Tibet and the Eastern Himalayas," 4.30 p.m.

Saturday, April 23.

R.I.B.A.—Council's Annual Report issued.

Monday, April 25.

ROYAL SOCIETY OF ARTS.—(Cantor Lecture). Mr. A. B. Searle's Third Lecture on "Modern Methods of Brickmaking," 8 p.m.

Friday, April 29.

ARCHITECTURAL ASSOCIATION.—Mr. Mowbray A. Green on "The Architecture of Bath." Election of officers. 7.30 p.m.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about five days or longer after the date of this issue. Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders. The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the Contract, which requires them to pay the rates of wages current in the district.

BUILDING.

April 8—20. **BIRMINGHAM.**—Erection of a fire station in Moseley Road, Highgate, for the Watch Committee. Before obtaining the bills of quantities, it will be necessary to deposit with the City Treasurer, Council House, Birmingham, a sum of £2 2s., for which a receipt will be given. Applications for forms of tender and bills of quantities may thereupon be made on or before April 8, at the office of the quantity surveyors, Mansell and Mansell, 47, Temple Row, Birmingham, on production of the official receipt for the fee. Drawings may be seen on and after same date at the office of the Architects, Arthur Harrison and Cox, 109, Colmore Row, Birmingham. Rate of wages, etc., clause to be observed. Tenders must be delivered, addressed to the Town Clerk, Council House, Birmingham.

April 9—May 3. **DEPTFORD.**—Erection of a branch library on the site in New Cross Road, S.E., for the Corporation, according to the drawings and specification prepared by Castle and Warren, Architects, and to be seen at their offices at Talbot House, Arundel Street, Strand, W.C. Persons intending to tender must send in their names to the Town Clerk so as to be received by him on or before Saturday, April 9, 1910, accompanied by a deposit of £2 2s. Bills of quantities, prepared by Dow, White, and Gee, of 12, Craven Street, Strand, W.C., together with the conditions of contract, will then be forwarded. Tenders must be delivered to the Town Clerk at the Town Hall, New Cross Road, S.E. The contractor will be required to subscribe to the wages clause embodied in the conditions of contract.

April 14. **YEOVIL.**—Alterations to factory, Summerhouse Road, for Ewens, Johnson, and Co. Builders desirous of tendering must send their names and addresses to John Petter and P. F. Warren, A.R.I.B.A., Architects and Surveyors, Church Street, Yeovil, with a deposit of £1 1s., on or before Thursday, April 14. Bills of quantities and form of tender will then be forwarded.

April 14. **WEYMOUTH.**—Erection of an elementary school for 270 boys, at Weymouth, from drawings prepared by Crickmay and Sons, Architects, 49, St. Mary Street, Weymouth and Westminster. Applications should be sent to G. P. Symes, Clerk to the Weymouth and Melbourne Regis Education Committee, 9 and 10, East Street, Weymouth, by April 14. Bills of quantities will be supplied to a selected number on receipt of a deposit.

April 16. **WEST STANLEY.**—Erection of proposed new banking premises, five shops, entertainment hall, etc., for Jonathan Green. Builders desirous of tendering are requested to send in their names to John J. Eltringham, by April 16, Derwent Street, Blackhill. Bills of quantities will be supplied to the selected builders.

April 18. **MANCHESTER.**—(See Plumbing and Sanitary.)

April 18. **CAMBERWELL.**—Contractors intending to quote for carrying out the construction of a new quay wall for the Borough Council are notified that the time for submitting tenders has been extended until April 18, 1910.

April 18. **CAERPHILLY.**—Erection of new higher elementary school, for the Glamorgan C.C. Plans may be seen, and specification, etc., obtained, for work No. 3, at Caerphilly police station, and at Glamorgan C.C. Offices, Westgate Street, Cardiff.

April 18. **OLDCASTLE.**—Repairs to the fireplaces, floors, etc., of the various wards of the Workhouse and Fever Hospital, for the Guardians. Specification, prepared by Michael Grace, jun., the Board's Engineer, can be seen at Union Offices, Oldcastle Workhouse.

April 18. **BRYNNAU.**—Additions to the Brynnau Council School, near Llanharan, for the Glamorgan C.C. Plans, etc., may be seen, and bills of quantities, etc., obtained, at the Llanharan police station, and at the Glamorgan C.C. Offices, Westgate Street, Cardiff.

April 18. **DINAS POWIS.**—Erection of cookery room at Brynnau Council school, near Llanharan, for the Glamorgan C.C. Plans may be seen, and bills of quantities, etc., obtained at the Dinas Powis Council school, and at Glamorgan C.C. Offices, Westgate Street, Cardiff.

April 18. **KEIGHLEY.**—Supply of bricks and stone covers during period ending June 30, 1911, for the Cemetery Committee. Tenders, addressed to the Chairman of the Cemetery Committee, to be sent to the Cemetery Registrar, Skipton Road, Keighley, from whom specifications may be obtained.

April 18. **PORT TALBOT.**—Erection of new infants' department of the Council school at Taibach, Port Talbot, for the Glamorgan C.C. Plans, etc., may be seen, and bills of quantities, etc., obtained, for work No. 2, at the Port Talbot police station, and at Glamorgan C.C. Offices, Westgate Street, Cardiff.

April 18. **WORTHING.**—Erection of a cookery and manual instruction school in Richmond Road, for the B.C. Specification may be seen and form of tender and bill of quantities obtained on application to the Borough Surveyor. Tenders to be sent to W. Verrall, Town Clerk, Municipal Offices, Worthing.

April 18. **ERITH (Kent).**—Erection of two additional wards and other extensions to the Erith Sanatorium, Little Heath, Belvedere, for the U.D.C. Bills of quantities, general conditions, and forms of tender may be obtained from Harold Hind, Surveyor, Council Offices, Erith, upon receipt of a deposit of £2 2s. Tenders to be delivered to J. Kennedy Allerton, Clerk, Council Offices, Erith.

April 18. **STRETFORD.**—Erection of a public Elementary School at Gorse Hill, Stretford, for the Education Committee. Plans may be seen and bill of quantities obtained on application to the architect, Frank W. Mee, F.R.I.B.A., 32, Victoria Street, Manchester, on deposit of £2 2s. Only those tenders will be entertained in which the contractor undertakes to proceed with the work with the utmost despatch and complete the same within the time set forth in the general conditions of contract. Tenders to be addressed to the Chairman of the Sites and Buildings Sub-Committee, Council Offices, Old Trafford.

April 18. **SOUTH FARNBOROUGH.**—Completion of the superstructure of the extension to workshops at the Balloon Factory, South Farnborough, in the Aldershot Command, for the Secretary of State for War. Plans, specification, and conditions of contract may be inspected at the office of the Director of Barrack Construction, 80, Pall Mall, London, S.W., on Wednesday, Thursday, and Friday, April 6, 7, and 8. Those desiring to tender and to receive a copy of the bills of quantities must apply to the Director of Barrack Construction not later than Saturday, April 9. The application must be accompanied by a deposit of 10s. Cheques or orders to be made payable to the Assistant Financial Secretary, and crossed "Bank of England for Credit to Army Funds." Tenders must be delivered addressed to the Director of Army Contracts, War Office, Whitehall, London, S.W.

April 18. **BEDLINOG (Wales).**—Works for the Glam. C.C.: (1) new girls' department of the Council school at Bedlinog; (2) new infants' department of the Council school at Taibach, Port Talbot: (3) new higher elementary school at Caerphilly; (4) additions to the Brynnau Council school, near Llanharan; (5) cookery-room at the Council school at Dinas Powis; (6) new latrines at the Council school at Hengoed. Contractors will be required to pay their workmen the recognised rate of wages, and must produce evidence of being insured against liability for accidents to workmen. Plans and specifications may be seen and bills of quantities and form of tender obtained for work No. 1, at the Treharris County Police Station; for work No. 2, at the Port Talbot Police Station; and for work No. 3, at the Caerphilly Police Station. Plans may be seen and specification and form of tender obtained for work No. 4, at the Llanharan Police Station; for work No. 5, at the Dinas Powis Council School; and for work No. 6, at the Bargoed Police Station. Plans, specifications, etc., of all the works may be seen or obtained at the Glamorgan County Council Offices, Westgate Street, Cardiff, to which address tenders, containing the names and addresses of two substantial sureties, are to be delivered.

April 19. **CWMGORSE.**—Erection of a Congregational Chapel at Cwmgorse. Plans and specification may be seen with T. Howell, Postmaster, Cwmgorse, or with W. Beddoe Rees, Architect, 3, Dumfries Place, Cardiff, of whom bills of quantities may be obtained.

April 19. **ABBEYLEIX.**—Erection of 33 labourers' cottages and fencing plots, for the R.D.C. Forms of tender, plans, specifications, and other particulars can be had on application at the office of James Finnegan, Clerk to Council, Clerk's Office, at the Workhouse.

April 19. **BEDWAS.**—Erection of a police station, for the Standing Joint Committee of the Monmouth C.C. Plans and specification may be seen at the office of William Tanner, County Surveyor, Newport, and copies of the quantities obtained on deposit of £1 1s. Tenders to be sent to the County Surveyor.

April 19. **HAZEL GROVE (Stockport).**—Erection of a new public elementary Council school on land in Chapel Street, Hazel Grove, near Stockport, to accommodate 250 children, with housewifery, laundry, and cookery centres, and caretaker's quarters, for the Cheshire Local Education Authority. Plans and specifications may be inspected and quantities obtained from the architect, C. T. Adshead, Leicester Chambers, 4, St. Ann's Square, Manchester, on payment of a deposit of £2 2s., on and after Tuesday, March 22. Tenders to be sent to J. W. Bann, Clerk, School Brow, Romiley, near Stockport.

April 20. **BLACKER HILL.**—Erection of four houses, for T. Howard. Plans and specifications may be seen and quantities obtained upon application to Arthur Whitaker, Architect, Worsborough Bridge.

April 20. **HEMSWORTH.**—Erection of 62 dwelling-houses, etc., at Fairwilliam Village, Hemsworth, for the South Kirkby, Featherstone, and Hemsworth Collieries (Limited). Send names with deposit of £2 2s. for bill of quantities, to Garside and Pontigon, Architects and Surveyors, Pontefract and Castleford.

April 20. **BARNSLEY.**—Pulling down the Imperial Corn and three adjoining cottages, Hoyle Mill, Barnsley, and for rebuilding the ram, with stabling, etc., for Clarke's Old Brewery, Barnsley Ltd. Plans and specification may be seen, and quantities obtained on application to R. and W. Dixon, Architects, 5, Eastgate, Barnsley, to whom tenders must be delivered.

April 20. **SEDGEFIELD.**—New cemetery lodge at Sedgefield Village, Co. Durham, for the Burial Joint Committee. Plans, specification, and conditions of contract may be seen and bills of quantities obtained at the office of J. W. T. Richards, M.S.A., Architect and Surveyor, 57, High Street, Stockton-on-Tees. Tenders to be posted to William Cole, Clerk to the Committee, 5, Windsor Terrace, Whitley Bay, R.S.O.

April 20. **ROYTON (near Oldham).**—Provision of shelters and other erections, asphalting of walks, and drainage of site in connection with the park and recreation ground, Radcliffe Street, Royton, for the U.D.C. Specification and quantities and other particulars may be obtained, and plans inspected at the office of the Architect, Ernest Woodhouse, F.R.I.B.A., 88, Mosley Street, Manchester. Tenders for the whole of the works combined to be forwarded to Thomas Bradshaw, Clerk, Town Hall, Royton, near Oldham.

April 21. **EVESHAM.**—(See "Engineering.")

April 21. **HAYNFORD.**—Erection of a dwelling-house at Haynford, Norwich. For specifications apply to Wm. Roberts, Haynford.

April 21. **NORWICH.**—Erection of a dwelling-house, at Haynford, Norwich. For specifications, apply to Wm. Roberts, Haynford. Plans can be seen at Thompson's, Newsagent, Stump Cross, Norwich; or at Mr. Roberts, Waterloo Place, Haynford.

April 22. **DURHAM.**—(See "Engineering.")

April 22. **PONTYPOOL.**—Erection of a public abattoir, stabling, and other works at Pontypool, for the Pontypool U.D.C. Drawings and specification may be seen, and forms of tender and bills of quantities obtained, on application at the office of D. J. Lougher, architect and surveyor, Bank Chambers, Pontypool, upon depositing £2 2s. Tenders to be sent to H. H. Haden, Clerk, Council Offices, Pontypool.

April 22. **WEST RIDING.**—Following works:—Warmsworth Dearn, Victoria Provided School, erection of new senior mixed department (builder, joiner, slater, plumber, plasterer, painter), for the Education Committee. Plans may be seen and specifications with quantities obtained on application to the Education Architect, County Hall, Wakefield. A sum of £1 in each case must be sent by separate letter to the West Riding Treasurer, County Hall, Wakefield. Tenders must be addressed to Francis Alvey Darwin, Clerk of the County Council, County Hall, Wakefield.

April 23. **ELLESMERE PORT.**—Erection of new County police buildings. Plans and specifications can be seen at the office of H. Berwick, F.R.I.B.A., County Architect, Chester, and quantities obtained on deposit of £1. Tenders to be delivered to Reginald Potts, Clerk of the Peace, Chester.

April 23. **TRIM.**—Repairs of Enfield Dispensary Residence. For full particulars as to terms of contract see handbills, which can be obtained on application to Vincent J. Sheridan, Clerk of Trim Union, Clerk's Office, Trim Workhouse.

April 23. **VERYAN.**—Erection of a cottage at Boswague Farm, Veryan, for W. Elliott. Plans and specifications can be seen either at the farm house or at the office of the architect, A. Ernest Harris, 28, Boscawen Street, Truro. Tenders to be sent to W. Elliott, Boswague Farm, Veryan.

April 25. **BEDWAS.**—Erection of fourteen semi-detached houses at Bedwas for the Tydfil Road Building Club. Plans and specifications may be seen at the Blackwood office of Ralph Simmonds, Architect and Surveyor, Blackwood, or at Bedwas by appointment. Tenders to be delivered to the Chairman, E. Lewis, Church Street, Bedwas.

April 25. **COVE (Southampton).**—Erection of a new Council school for 140 children at Cove. Plans, specifications, and conditions of contract (no quantities) may be seen, and other information obtained, at the office of W. J. Taylor, County Surveyor, The Castle, Winchester, on and after Monday, April 4. A copy of the plans and specification will also be deposited at the existing school at Cove. Tenders are to be delivered to H. Barber, Clerk of the County Council, The Castle, Winchester.

April 25. **EASTWOOD (Essex).**—Erection of a cowshed for eight cows, on land adjoining the Council school at Eastwood, for the Essex C.C. The cowshed must comply with the dairies, cowsheds, and milkshops orders, and any regulations made thereunder, and also with any local bye-laws, and subject thereto, it should be constructed of weather-boarding on a brick foundation, with concrete floor and tiled roof. Tenders (with plans and specifications) should be sent to the Clerk of the Council, Shire Hall, Chelmsford.

April 26. **ROCK FERRY (Birkenhead).**—Erection of a sorting office, Rock Ferry, Birkenhead, for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to W. Gilruth, H.M. Office of Works, Head Post Office, Liverpool. Bills of quantities and forms of tender may be obtained at H.M. Office of Works, Storey's Gate, London, S.W., on deposit of £1 1s. Tenders must be addressed to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

April 26. **CHELMSFORD.**—Works in their cattle market, for the B.C.:—1, construction of a roof over Rodd and Slipper's stand; 2, construction of a roof over Offin and Rumsey's auction ring; 3, erection of a small horse shed of corrugated iron; 4, fixing new manger in, and repairing, existing horse shed. Specification and form of tender, and full particulars, may be obtained, and the plans may be inspected, at the Borough Surveyor's Office, 16, London Road. Tenders must be delivered at the office of W. Smith, Town Clerk, Municipal Offices, 16, London Road, Chelmsford.

April 27. **CREWE.**—Erection of a sorting office, Crewe Station, for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to the Postmaster, Head Post Office, Crewe. Bills of quantities and forms of tender may be obtained at H.M. Office of Works, Storey's Gate, London, S.W., on deposit of £1 1s. Tenders must be addressed to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

April 27. **WOOLWICH.**—Additions, alterations, and repairs to a mission hall in Francis Street, North Woolwich, to adapt same for use as a branch public library, for the B.C. Persons or firms desirous of tendering may, upon depositing the sum of £1 1s., obtain copies of the drawings, specification and form of tender at the office of J. Rush Dixon, M.Inst.C.E., Borough Engineer, Town Hall, Woolwich. The person or firm whose tender is accepted will he required to pay Trades Union rates of wages, to observe Trades Union hours of labour, and to enter into a formal contract. Tenders must be sent to Arthur B. Bryceson, Town Clerk, Town Hall, Woolwich.

April 28. **GLASS HOUGHTON (Castleford).**—Erection and completion of the new "West Riding Hotel," at Glass Houghton, near Castleford. Send names to Ernest E. Pickersgill, Architect, Brewery Offices, Pontefract, before April 21. Quantities may be obtained, and plans and specifications inspected after that date at same address.

April 29. **LEYTONSTONE.**—Erection of a new county high school for 300 girls, to be erected at Forest Road, Leytonstone, Essex, for the Education Committee, in accordance with plans and specifications prepared by the architect, W. Jacques, A.R.I.B.A., 2, Fen Court, Fenchurch Street, London, E.C., at whose offices the plans and specifications, together with forms of contract, may be seen on any day except Saturday. Builders and contractors wishing to tender must send their names and addresses, together with a deposit of £5, to the Architect, on or before Monday, April 11, 1910. The contractor whose tender is accepted will be required to give the bond of an approved guarantee society in the sum of £1,000 as security for the due performance of the contract. Tenders to be delivered to R. Dempsey, Clerk to the Leyton District Sub-Committee.

April 30. **FALMOUTH.**—Additions and alterations to the Falmouth Grammar School, for the Governors, the work including heating of the premises by hot water, according to plans and specifications, which may be seen by appointment at the school, or at the office of the Architect, Sampson Hill, Green Lane, Redruth. Tenders to be sent to R. J. Loney, Clerk, 26, Norfolk Road, Falmouth.

April 30. **GOODMAYES (West Ham).**—Alterations and additions, Little Heath House, Goodmayes Asylum, for the Borough Council. Plans and specification may be seen, and form of tender, bills of quantities, and further particulars obtained at the office of John G. Morley, Borough Engineer, Town Hall, West Ham, E., upon deposit of £1 1s. Note.—No tender will be considered unless the same is delivered at the office of the Town Clerk, Town Hall, West Ham, E., in the envelope supplied, by registered post. The contractor will be required to enter into a bond with one surety for the due performance of the contract, and no work will be ordered under the contract until such bond has been duly executed. The contractor whose tender is accepted will be required to pay the whole of his workmen such rate of wages and observe such hours of labour as are recognised by the workmen's trade unions, and shall not assign nor underlet or make a sub-contract with any person or persons for the execution of any part of such work. In the event of any breach of such agreement the Council will enforce the penalty clause in its entirety.

May 17. **BRIDGEND.**—Erection of a new board-room and offices at the workhouse, for the Guardians. Plans, etc., may be seen, and all particulars obtained at the office of P. J. Thomas, architect, Bridgend. Tenders to be sent to R. Harmar Cox, Clerk, Union Offices, Bridgend.

No date. **STAINCROSS.**—Slating and plumbing for one house. For plans and specifications, apply, H. Yardley, Braithwaite Street, Staincross.

No date. **GOSPORT.**—Erection of new Wesleyan church and schools. Apply for quantities to Gordon and Gunton, Architects, Finsbury House, Blomfield Street, London, E.C.

No date. **ARMLEY.**—Erection of extension to works, Canal Road, for J. W. Roberts, Ltd. Names and addresses to G. Fredk. Bowman, Architect, 5, Greek Street, Leeds, and quantities will be forwarded in due course.

No date. **AISLABY.**—Erection of a cottage, at Aislaby, for G. Cass. Drawings, etc., may be seen at the office of A. E. Young, Architect and Surveyor, 77, Baxtergate, Whitby, and quantities will be forwarded to applicants.

No date. **SELBY.**—Erection of three cottages in Flaxley Road for the Selby Steam Laundry Co., Ltd. Plans may be inspected and specifications obtained at the laundry.—Henry T. Tate, Architect, 6, Arlington Avenue, Cottingham, East Yorks.

No date. **LEEDS.**—Alterations of premises in St. Peter's Street, for A. W. Scarr and Sons (Ltd.). Send names to Fredk. W. Rhodes, M.S.A., Architect and Surveyor, Upper Wortley, Leeds, and bills of quantities will be forwarded when ready.

No date. **EXETER.**—Rebuilding Nos. 175 and 176, Sidwell Street, Exeter, for James Hammett. Drawings and specification may be seen at the office of James Jerman, F.R.I.B.A., Architect and Surveyor, 1, Bedford Circus, Exeter, and also any further particulars obtained.

No date. **WHITBY.**—Altering and part rebuilding of butcher's shop, and other premises adjoining, in Tunnel Road, Grosmont, near Whitby, for Mrs. Wm. Duck. Plans may be supplied to builders, upon written application agreeing to tender.—Thomas Dowson, Architect and Surveyor, 3a, Flowergate, Whitby.

No date. **RHYL.**—Contractors desirous of tendering for any of the following work may have quantities (which will be ready about the 16th inst.) upon application to Maxwell and Tuke, architects and engineers, 25, Brazennose Street, Manchester. The contractor must enclose with his application a cheque for £1 1s. as deposit for each or any of the three contracts. No. 1.—Widening and encasing the present iron pier, constructing a jetty some 600 yards long to deep water, all in ferro concrete. No. 2.—Erection and construction of a new assembly hall, visitors' club, numerous shops, tea-rooms, and offices, sundry alterations to the present amphitheatre, all of which are to be built on terra firma and constructed of brick, etc. No. 3.—New Dining-room, refreshment-room, kiosks, and shelters, to be erected on the pier proper, and will be constructed principally of wood, iron, and cement.

ENGINEERING.

April 16—17. **TOW LAW.**—Providing the whole of the material, including the filtering medium, and the construction of works for the purification of sewage, for the U.D.C. Contractors desirous of tendering for these works must send their names and addresses not later than April 16, to John Hillary, Surveyor to the Council, Tow Law, accompanied by a deposit of £2, and to such contractors all particulars necessary for tendering will be furnished. Contractors desiring to inspect the site of the works must meet the Surveyor at Tow Law Station at 1 p.m. on April 20, when plans of the proposed works may be examined. Separate tenders are to be submitted for the providing of the filtering medium and the other parts of the works. Tenders must be sent to Edwd. Milburn, Clerk to the Urban District Council, Council Offices, Tow Law.

April 18. **WIGTON.**—(See "Plumbing and Sanitary.")

April 20. **LITTLEOVER, NEAR DERBY.**—Construction of about five miles of 15in., 12in., 9in., and 6in. pipe sewers, together with manholes, gauge chambers, stormwater overflows, ventilating shafts, and other accessories, for the Shardlow R.D.C. Plans and specification may be seen at the office of the engineers, Shaw, Son, and Fuller, The College, All Saints', Derby, and a form of tender and a copy of bill of quantities may be obtained from them on deposit of £1 1s. Tenders must be sent to J. W. Newbold, Clerk, Becket Street, Derby. The contractor whose tender may be accepted will have to enter into a bond with two bondsmen to ensure his financial ability to carry out the work.

April 20. **ROCHDALE.**—Construction in ferro-concrete of a high level road and coal store in connection with their gasworks, for the Gas and Electricity Committee of the Corporation. Plans and levels of the site may be seen and conditions of tender obtained on application to T. Banbury Ball, the manager, at the Gasworks, Dane Street, Rochdale, from whom any further information may be obtained. Tenders to be addressed to the Chairman of the Gas and Electricity Committee, Town Hall, Rochdale.

April 20. **SOUTH DUBLIN.**—Construction of a sewer and works connected therewith in the Donnybrook portion of the Rural District, in accordance with drawings and specification prepared by the Engineer, T. J. Byrne, A.R.I.B.A. Drawings, specification and conditions of contract may be inspected at the office of the R.D.C. Schedule of quantities and forms of tender may be obtained at the council's office. Tenders addressed to "The Presiding Chairman," will be received by George Gallagher, Assistant Clerk of the Council, 1, James's Street, Dublin. Solvent security in two persons, or the Bond of an approved Assurance Company, for the due performance of the work will be required.

April 21. **DURSLEY.**—Heating and hot-water supply service at the Workhouse, where a specification can be seen on application to the Master. Tenders to be delivered to J. G. Wenden, Clerk to the Guardians, Dursley.

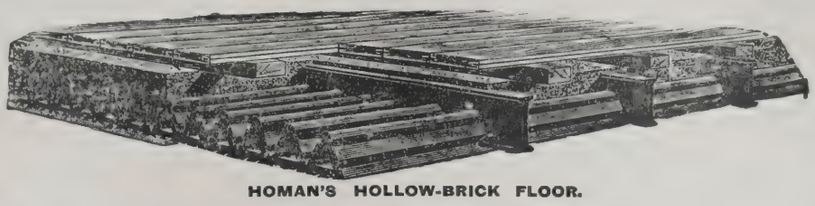
April 21. **FISHTOFT.**—Heating the Parochial school by means of the low pressure hot-water system, for the Trustees. The school may be inspected on any week-day on written application to Rev. E. P. Cook, Fishtoft Rectory, Boston, to whom tenders must be sent.

April 21. **EVESHAM.**—Provision and erection of a ferro-concrete band stand on the public recreation ground, for the T.C. Plans and specifications can be inspected by persons or firms desirous of tendering, at the offices of H. S. Harvey, the Borough Surveyor, Town Hall, Evesham, who will supply all further necessary particulars. Tenders to be sent to Thos. A .Cox, Town Clerk, Evesham.

April 21. **LAMBERHURST (Tonbridge).**—Taking up and relaying of about 240 yards of 15in. pipe, and construction of about 400 yards 9in., and 70 yards 6in. stoneware pipe sewer, with 12 manholes, etc., etc., in the village of Lamberhurst, about three miles from Goudhurst Station, for the Tonbridge R.D.C. Plans and specifications may be seen, and bill of quantities and form of tender obtained on application at the office of Frank Harris, Engineer and Surveyor to the Council, Broadway, Southborough, Tunbridge Wells, on deposit of £1 1s. Tenders to be delivered to Neville R. Stone, Clerk to the Council, 23, Church Road, Tunbridge Wells.

April 22. **DURHAM.**—(1) Reconstructing stone bridge, near Durham, with steel girders, 48ft. span, and masonry abutments, etc.; (2) reconstructing Aldin Grange Old Bridge (masonry arch, 45ft. span); and (3) paving road channels, laying concrete kerb and flags in Front Street, Chester-le-Street. Plans and specifications can be seen and bills of quantities for Stone Bridge, obtained at the County Engineer's Office, Shire Hall, Durham. Tenders, as the case may be, to be delivered to William Crozier, A.M.Inst.C.E., Security for the proper completion of the work will be required.

April 23. **STROMA.**—Construction of additional works to be executed at Stroma South Pier, for the Caithness C.C. Copies of the plans, etc., may be seen at the office of Mr. James Young, County Clerk, County Clerk's Office, Thurso.



April 23. **LINTHWAITE.**—Widening of the Wakefield and Austerlands Main Road, for the Highways Committee of the West Riding, the works including the erection of a brick, or masonry, retaining wall, in length about 130 yards by a maximum depth of 30ft. Plans may be seen and bills of quantities, etc., obtained, at the office of F. G. Carpenter, West Riding Surveyor, County Hall, Wakefield, on deposit of £1. Cheques, etc., should be forwarded and made payable to "The West Riding Treasurer," County Hall, Wakefield.

(Continued on page xvi.)

Prescott, manager of the Drainage Department, between the hours of 9 and 11 o'clock each morning. Tenders must be addressed to the Chairman of the Drainage, etc., Sub-Committee, and delivered at the Drainage Office, Town Hall, Manchester.

April 23. **DONCASTER.**—Laying 253 yards of 9in. fire clay pipe sewer, including two manholes, average depth 4ft. 6ins., in Windmill Balk Lane, Adwick-le-Street, for the R.D.C. Specifications and further particulars may be obtained from or seen at the office of the Surveyor, W. R. Crabtree. Tenders must be sent to F. E. Nicholson, Solicitor, Clerk to the Council, Union Offices, High Street, Doncaster.

No date. **STAINCROSS.**—(See "Buildings.")

ROADS AND CARTAGE.

April 18. **PRESTON.**—Levelling, paving, etc., back road behind Clifton Place, Long Lane, Ashton-on-Ribble, for the Corporation. Plan, section, and specification, may be seen, and schedule of quantities and form of tender obtained at the office of the Borough Surveyor, Town Hall, Preston, to whom tenders must be delivered. Fair contracts clause.

April 18. **LITHERLAND.**—Widening and improving of Sefton Street for the U.D.C. Plans and specification can be seen and form of tender and quantities obtained on application to A. H. Carter, Surveyor, Public Offices, Sefton Road, Litherland, any morning between the hours of 9 and 11 o'clock, on deposit of 10s. 6d. Tenders to be sent to William Kirk, J. W. Allen North, Clerks to the Council, 15, Lord Street, Liverpool.

April 18. **LIVERPOOL.**—Widening and improving Sefton Street, for the Litherland U.D.C. Plans and specification can be seen and form of tender and quantities obtained on application to A. H. Carter, Surveyor, Public Offices, Sefton Road, Litherland, between 9 and 11 a.m., on deposit of 10s. 6d. Tenders to be sent to William Kirk and J. W. Allen North, Clerks to the Council, 15, Lord Street, Liverpool.

April 18. **SUNBURY-ON-THAMES.**—Supplying and laying of about 1,600ft. run of 12in by 4in. blue Pennant bunched kerbing; also for the supply and delivery only of Derbyshire limestone tar paving to Sunbury railway station, in such quantities as the Council may require before March 31, 1911, for the U.D.C. Specifications and forms of tender for each of the above contracts may be obtained on application to Harold F. Coales, A.M.I.C.E., Surveyor. Tenders to be addressed to Charles E. Goddard, Clerk, Council Offices, Sunbury-on-Thames.

April 19. **RISHTON.**—Labour in sewering, paving, flagging, etc., in Cliff Street (Lord Street to Stourton Street) and in Danvers Street (Cliff Street to back Cliff Street West), for the U.D.C. Plan may be seen and specification and form of tender obtained on application to the surveyor, at the Council Offices, Brook Street, Rishton, to which address tenders must be sent addressed to J. J. Adams, Clerk.

April 19. **BARKING.**—Surface water draining, forming, making up, metalling, channelling, kerbing, lighting, fencing, etc., of a new road, about 440 yards in length, to be known as Abbey Road, within their district, for the U.D.C. Plans and details can be seen, and specification, quantities, and form of tender obtained, upon application to C. F. Dawson, Surveyor to the Council, Public Offices, Barking. Tenders may be delivered to the Council at 7 p.m. on Tuesday, April 19, or be sent by post to H. Hargreaves, Clerk to the Council, Public Offices, Barking. Fair wages clause.

April 20. **BOURNEMOUTH.**—Making up Bryanstone Road, for the B.C. Full particulars, forms of tender, specification and schedule, may be obtained of the Borough Engineer, F. W. Lacey, at whose offices drawings can be seen, provided that the sum of £1 1s. has been previously deposited in respect to each tender, with F. W. Lacey, M.I.C.E., Borough Engineer and Surveyor, Municipal Offices, Bournemouth.

April 21. **GLOUCESTER.**—Stone and hauling, for the R.D.C. Forms of tender may be obtained at the offices of the Council, Berkeley House, Berkeley Street, Gloucester, from F. E. Weaver, the District Surveyor. Tenders must be sent to Herbert H. Scott, Clerk to the Council.

April 21. **GRAVESEND.**—Supply of the following road materials, etc., for the Corporation:—English or Welsh basalt; Cherbourg quartzite; granite setts; ragstone chippings. Specification, form of tender, and all other information may be obtained on application at the office of the Borough Surveyor, F. T. Grant, Town Hall, Gravesend. Tenders must be delivered to the office of H. H. Brown, Town Clerk, Gravesend, together with samples of the materials which it is proposed to supply.

April 22. **DURHAM.**—(See "Engineering.")

April 22. **THIRSK (Yorks.).**—Supply of about 1,000 tons of whinstone and 6,000 tons of lag, to be delivered, carriage paid, at one or more of the following stations:—Boroughbridge, Brafferton, Coxwold, Humberton sidings, Newby Wisk, Otterington, Pilmoor, Se say, Sinderby, Thirsk Junction, Thirsk Town, and Topcliffe, for the Thirsk R.D.C. Form of tender can be obtained from R. R. Wright, Highway Surveyor, Thirsk, on receipt of stamped addressed foolscap envelope. Duplicate samples of stone are to be sent to the Surveyor of Highways, Thirsk R.D.C. Thirsk. Tenders must be sent to William Swarbreck, Clerk, Finkle Street, Thirsk.

April 25. **REIGATE.**—Supply of the following materials:—Granite macadam, basalt, and flints; granite kerb and setts; Kent ragstone; tar-paving material; artificial stone paving; gravel; concrete beach; pea beach; compo, grit; Portland cement. Forms of tender, conditions of contract, and full particulars may be obtained upon application to Fred T. Clayton, the Borough Surveyor, and every person tendering will be required to deposit at his office, at the Municipal Buildings, Reigate, a sample of the materials for which he tenders. Tenders are to be delivered at the office of Alfred Smith, Town Clerk, Municipal Buildings.

April 25. **STEVENAGE.**—Tar-paving the footpath (about 2,200 superficial yards), along the east side of High Street, the south side of Basil's Approach, and the north side of Providence Row. Also for paving with tar macadam the roadways (about 500 superficial yards) in Middle Row and Baker's Row, within their district, for the U.D.C. A plan of the proposed work can be seen, and a copy specification and form of tender can be obtained at the offices of the Council in Orchard Road, Stevenage. Tenders to be delivered to Wm. Onslow Times, Clerk to the Council, Urban District Council Offices, Stevenage.

April 26. **GOSFORTH.**—Carriageway and footway construction, for the U.D.C. All particulars may be obtained from George Nelson, A.M.Inst.C.E., Engineer and Surveyor to the Council, Council Chambers, High Street. A deposit of £2 2s. is required for quantities.

April 28. **CHATHAM.**—Supply of broken granite or other hard stone and surface picked flints, for the T.C. Specification, schedule, and form of tender can be obtained on application at the Borough Surveyor's Office, Town Hall, Chatham. Tenders to be delivered to Charles Day, Borough Surveyor, Town Hall, Chatham.

No date. **PONTELAND.**—Contractors desirous of tendering for several miles of roadmaking on the Dorras Hall Estate, will please send in their names and addresses to Watson and Scott, 48, Dean Street, Newcastle.

MISCELLANEOUS.

April 20. **HORSHAM.**—Tar paving of the playgrounds and incidental work at the Horsham Southwater Council school, for the West Sussex Local Education Authority, situate about three miles from Horsham and within half a mile of the Southwater Railway Station (L.B. and S.C.R.). Specifications and forms of tender will be forwarded on application to Lionel Thompson, Secretary, Education Offices, Horsham, Sussex, to whom tenders must be sent.

Fulwell Hydrated Lime.

A high-class Lime, slaked by a patent process, and packed in bags. Saves the labour of washing and running the lime, will not blow, leaves no waste, may be stored without deterioration and without bursting the bags.

For mouldings and lathwork can be gauged with a much smaller proportion of plaster than ordinary lime.

Converts lime into a safe, reliable and convenient material with the advantages of a bagged plaster.

Further Particulars and Samples from:—

The Exors. of the Late

Sir HEDWORTH WILIAMSON, Bart.,

Fulwell Lime Works, SUNDERLAND.

THE ARCHITECTS' & BUILDERS' JOURNAL.

WEDNESDAY,
APRIL 20th, 1910.

Volume XXXI. No. 794

Photo: W. H. Watts.

Temple Bar, of which Sir Christopher Wren was the architect, was re-erected at Theobald's Park, Hertfordshire, where it now stands,

TEMPLE BAR WHICH IT IS PROPOSED TO BRING BACK TO LONDON.

This building is one of the finest works of Alexander Thomson, the Scottish genius who, without having travelled or studied abroad, evolved some wonderful classic designs which earned him the sobriquet of "Greek" Thomson.

Architectural Work in India.

TILL within a few years ago architecture was a subject which could hardly be said to be officially recognised by the Anglo-Indian Government. Buildings were carried out for the most part by the Public Works Department, known shortly as the "P.W.D.," whose officials were, and are still for the most part, engineers. One architect of undoubted ability, Mr. Chisholm, who has now returned and settled in London, designed various important buildings in which there was a happy attempt to give something of Oriental feeling to the architecture without descending to direct copyism of Hindu or Indo-Saracenic detail. But Mr. Chisholm seems to have been alone in this kind of effort to give a special æsthetic treatment to buildings erected under English rule in India. Generally speaking, such buildings seem to have been marked either by a commonplace classicism, or later, in some instances, by a rampant modern Gothic treatment in what used satirically to be called the "Manchester Gothic" school.

Fortunately, however, a few years ago the Indian Administration came to see the advisability of establishing a "Consulting Architect to the Government of India." In December, 1902, Mr. James Ransome received this appointment for a term of five years, at the end of which time Mr. John Begg was appointed his successor. Both gentlemen are Fellows of the Institute of Architects; by the older among our readers Mr. Begg's name will be remembered as that of one of the finest draughtsmen of his day in London. We have now before us an album showing Government buildings which have been carried out from Mr. Ransome's designs, and the two first Annual Reports (1907-8 and 1908-9) on architectural work in India, drawn up by Mr. Begg, and each accompanied by illustrations of some of the buildings recently erected.

The preliminary notice to the first of these Reports conveys the idea that there is still a good deal of difficulty in even obtaining the requisite materials for a comprehensive annual report of architectural work in India, and that much work done in the provinces does not come under the notice of the consulting architect at his central department in Calcutta. It appears to have been a nominal direction by the Government of India, from the first appointment of a consulting architect, that photographs or drawings of all important architectural works carried out in India should be sent to the consulting architect for inspection and review. But it is one thing to issue such a decree and another to get it attended to, in so vast a country as India. Comparatively few do, apparently, arrive, and in the preliminary notice referred to it is mentioned that the author of the Report had just received photographs of two buildings in one province, one of them completed about three, and the second more than five, years ago. As he drily remarks, "This Report must not trench on the province of the Archæological Department."

These matters of administrative mechanism will no doubt right themselves in time, as those concerned with building in India become used to the working of an institution which must have seemed rather a startling novelty at first, after so many years of neglect of the interests of architecture by the official authorities. We come now to the real interest of the subject — what has been and may be done with English architecture in India.

It is a rather curious question for discussion, whether a conquering nation should take its own architectural style into its new possession, or adopt the indigenous style for the buildings erected under its rule. The Romans, who may be considered as the typical conquerors of history, adopted the former principle, and carried their own columnar style wherever they went. There were occasional examples of modifications of detail from local influence, but in general a Roman triumphal arch, for example, was essentially the same in design and style wherever it was erected. On first becoming possessors of India, we followed the same course, not consciously or on principle, but because it was the natural thing to do, and no English Government or English Proconsul in those days would have thought of troubling their heads about architecture. Accordingly we built streets or business buildings of Regent Street Classic, and a cathedral of Rickmanised Gothic. No one thought whether it was right or wrong. But now Governments and Viceroys—one recent Viceroy in particular—have begun to think on the subject, or engage others to think for them; and it is of importance that they should think right.

At present there seems rather a divided mind on the subject. Mr. Ransome's collection of designs, "issued under his advice, while consulting architect to the Government of India" (that is the way it is put in the preface) shows no certain aim; but we do not know how far he is responsible for this. His illustrations commence with new buildings in Wellesley Place, Calcutta (see page 352 et seq.), a well-balanced classic design, such as might suitably be erected in any important city in England; designs for a Government House at Dacca, and for Government offices in Calcutta, are also pure classic, and rather tame as such, though they derive a certain effect from the necessity of having the real interior walls masked by arcades or colonnades, with a space behind them, in order to keep the direct heat of the sun off the walls. Other designs in the book, however, are on very different lines. A design for "A Block of Offices for the Plains" (not carried out) appears to have been really intended for a railway station at Lahore, and shows the employment of certain Saracenic features on a plain utilitarian structure of red brick, and sparingly used stone dressings. The result is, in the illustration at least, very pleasing, but it must be admitted that it does not look like a building erected under English influence. Nor does the telegraph office at Dacca (see illustration). But this is more to the purpose, because it is a simple design obviously influenced by climate; palpably a hot-weather building; though one may well ask why Dacca should have a classic Govern-

ment office and a very Oriental-looking telegraph office. Mr. Ransome's own position, as briefly stated in his preface, is that "there is no style of architecture suited in its entirety to the requirements of Europeans in the plains of India." The classic designs he seems to think have to be too much modified for climatic conditions to be satisfactory in effect. Gothic does not give enough shelter from the heat without completely modifying its fashion of traceried windows—that is, we presume, making closely woven tracery, with small openings, as in the Indo-Saracenic style; a modification which might, however, go well enough with the Gothic style. The native styles, says Mr. Ransome, are rich in useful suggestions, "but their extravagant ornament and elaborate features render their faithful interpretation inexpedient;" a conclusion in which we should entirely concur.

We are inclined to think that the solution would be found in thinking a little less about styles, native or European, and more about Style, as a quality based on practical conditions, and influenced to some extent by European tradition. We do not see why buildings based on Classic precedent should not bear modifying to meet the conditions of a hot climate, without sacrificing either their architectural effect or their appearance of European origin. Something like this seems to have been done in the Secretariat at Nagpur—an original and pleasing design, and in the Kennedy House Secretariat at Simla, the first design for which is exceedingly European—Scottish, in fact; the adopted design, which is much superior, has European character, but with a difference; it is not a building one would expect to find in Europe, and yet it has the touch of the European hand. It is the best design in Mr. Ransome's book. It is worth note that this building was specially designed for construction in concrete-steel, and it is one of the best examples we have seen of what may be done with that material. A drawing of it was exhibited at the last Royal Academy.

From Mr. Begg's Reports we take one of the illustrations of the High School at Ahmedabad, which is a good example of effect in a brick building, obtained by simply planning and constructing it so as to suit the climate. Who is exactly responsible for the design is not apparent; but taking it for what it is, a school under English rule in a tropical climate, it is the right kind of thing, suitable without being pretentious. Our remaining illustration, the school at Kotwali, a building by the Public Works Department of that town, is much praised by Mr. Ransome as "a good example of what the Indian stone-cutter can be got to do, even in these days, when given a fair chance." That is a point that is of interest, of course; but this building is simply an imitation of Indo-Saracenic, and that is not the treatment for a school-building erected under English government. Imitations are of no value.

The illustrations generally, accompanying the two Reports, show a great difference and uncertainty of aim in Anglo-Indian architecture. The Presidency General Hospital, Calcutta, has the same merits as the Ahmedabad High School, an unpretentious building structurally expressive of its purpose and conditions. In other designs there is an extraordinary variation of type. "New Additions, Viceregal Lodge, Simla," is a wretched piece of bastard Elizabethan, we should say obviously "P.W.D." work. Then the "Proposed Vice-regal Lodge," with its stone lower storey, and plaster and timber above, looks like a small country house in England (perhaps that was the intention), and the "Library, Simla," like the public library in an English country town. There seems as yet to be no settled path or method for Anglo-Indian architecture. The illustrations to the two Reports are a medley; and there will probably be no difference in this respect until architectural administration in India is so far advanced that the consulting architect to the Government of India may be able to exercise a real influence on the style of the buildings erected, instead of this being left, in so many instances, to the caprice of departmental engineers.

St. Paul's Bridge.

IN regard to the scheme of the proposed new bridge over the Thames, to be called "St. Paul's Bridge," there has been for some time back a rather ominous silence on the part of the authorities officially concerned. Public attention was drawn to the subject some time ago; a deputation was, if we remember right, sent by the Institute of Architects to the City authorities to urge the importance of making the new bridge architecturally worthy of its position, and not considering it merely as an engineering work; and general assurances were given that this aspect of the matter would be duly considered. But when we have heard nothing more for so long a time, we naturally get anxious to know what has been hatching. A letter on the subject, signed by eight eminent artists, which appeared in the "Times" of Friday last, was therefore very opportune, and it is to be hoped that it will elicit something. The writers of the letter observe that the treatment of London bridges recently does not inspire confidence in the future; "excellent pieces of engineering as they often are, they are, from the point of view of civil architecture, deplorable." This is not, however, a very wisely worded sentence, for they ought to have remembered that the very latest bridge, Vauxhall, is not in this sense deplorable at all, and it is understood that its general design was the work of a very eminent architect. It is true, however, that Vauxhall Bridge would have been a perfectly horrible design if a certain amount of public feeling on the subject had not been aroused by criticisms by competent judges in the Press. The letter now published would have been more effective if the recent bridges that are most objectionable had been pointed out. These are undoubtedly Blackfriars Bridge and the Tower Bridge; both of them pieces of would-be Gothic gewgaw of the most barbarous description. Engineers, however, are still for the most part unaware that these bridges are bad, or why they are bad; and those who care about the subject are naturally afraid of finding that all this time an engineer's design for St. Paul's Bridge has been getting into shape and getting accepted behind the scenes; and then we shall be told (as we were in the case of Vauxhall Bridge) that it would be "an insult to the engineer" to engage an architect to revise and improve his design. What we want to see is a grand masonry bridge of the same type as London Bridge; that alone can really become an adequate part of the architecture of London. What ought to be done is either to advertise a sketch competition, open to all, for ideas for the new bridge, and select the best six for a final competition, or to invite a certain number of architects and engineers to submit designs in a limited competition. In a matter of such importance to the architectural beauty of London nothing ought to be settled until the proposed design has or designs have been publicly seen and judged. On this subject one is glad to see that a daily paper so powerful as the "Times" is wide awake, and has supported the letter referred to by a short but excellently reasoned leading article. The enlightenment of the "Times" on matters æsthetic in recent (very recent) years is, in fact, as surprising as it is gratifying. Remembering how its columns used to be the happy hunting-ground of such Philistines as the late Lord Grimthorpe, one is inclined to exclaim "Is Saul also among the prophets?"

Trouble in Germany.

AT the moment of writing, a bitter struggle between employers and employed in the building trade in Germany seems imminent. The employers have threatened to lock out the men unless the latter yield unconditional acquiescence in the terms proposed to them. These terms are so exorbitant that no self-respecting body of men could be expected to accept or tolerate them. That is apparently the precise idea with which they are being so ruthlessly enforced. The employers are determined upon a war of extermination of the trades unions, and neither Government intervention nor the remonstrances of influential organs

of the Press, seem to have the slightest power to make them swerve from this settled purpose. Possibly they may have been greatly provoked, and are now bent upon remorseless reprisals. It used to be alleged that foreign trades-unionism was a very bad copy of the British original; and what with *sabotage* in France and militant socialism in Germany, it may be inferred that the employers have only too much reason to distrust it, and one may even suspect that they are to some extent justified in their fierce endeavour to destroy it. In this country such an endeavour would fail, for the simple reason that public opinion would be fatal to it. The newer and truer trades-unionism that has been now evolved amongst us is generally recognised as being on the whole admirable in principle and fairly straightforward and honourable in practice. The foreign variety has perhaps yet to go through several stages of development before it can render itself either equally praiseworthy or comparably efficient. But since the Germans have borrowed from us the idea of organisation by the work-people on the one hand, and the employers on the other, why do they not go a step or two further, and copy the admirably effective Conciliation Boards by which the builders in our country have apparently succeeded—almost miraculously—in eradicating industrial warfare? Strikes and lockouts can never become impossible on this side of the millennium; but the Conciliation Boards, and the better feeling and more perfect understanding which they engender, have more than justified the anticipations with which they were inaugurated. It is hardly too much to say that they have infused a new spirit into industrial life; and, so far, they seem to have rendered industrial war a reminiscence of the barbarous past. Germany can have no more use for strikes and lockouts, with the ruinous losses and all the misery and suffering they entail, than we have: and we are sure that the National Federation of Building Trades Employers of Great Britain and Ireland would be only too happy to supply their German congeners with full and explicit guidance in the path of peace.

A Discovery of Italian Frescoes.

SOME interesting frescoes have been uncovered recently in the Church of St. Quirico, in the neighbourhood of the frontier village of Domodossola. The parocco of St. Quirico is situated about a mile or a mile and a-half from the station, and the quaint little church occupies a commanding position on an abutting hill at the foot of Mount Calvario, surrounded by vineyards. The view from the church stretches up and down the vale of the Ossola, through which the river meanders alongside the railway (which runs on to Arona and Milan) and across to the opposite hills, the lower slopes of which are clothed with vineyards, with an occasional church situated on apparently strategic points, similar to that on which we stand.

This little frontier Church of St. Quirico is a dependence from the Cathedral of Domodossola, from which, twice a year, on Rogation Sunday, and again on the first Sunday in July, a priest is sent to celebrate Mass; these being the only two services held in the church during the year, unless one is held in connection with some unusual and special function. A wealthy widow lady, of Turin, who spends the summer months at Domodossola, has recently interested herself in the church, and it is by her devotion and effort that the splendid frescoes now revealed for the first time after many centuries, have been brought to light. A little more than half of the work has been done so far, and the Signora Rosa Calpini hopes to return next year and complete the work which has already had so splendid a result. It seems that there is no authentic record of the foundation of the church, but from its style and appearance it is supposed to date from the thirteenth or fourteenth centuries. It was for many hundreds of years the only church in the whole of the Vale of Ossola.

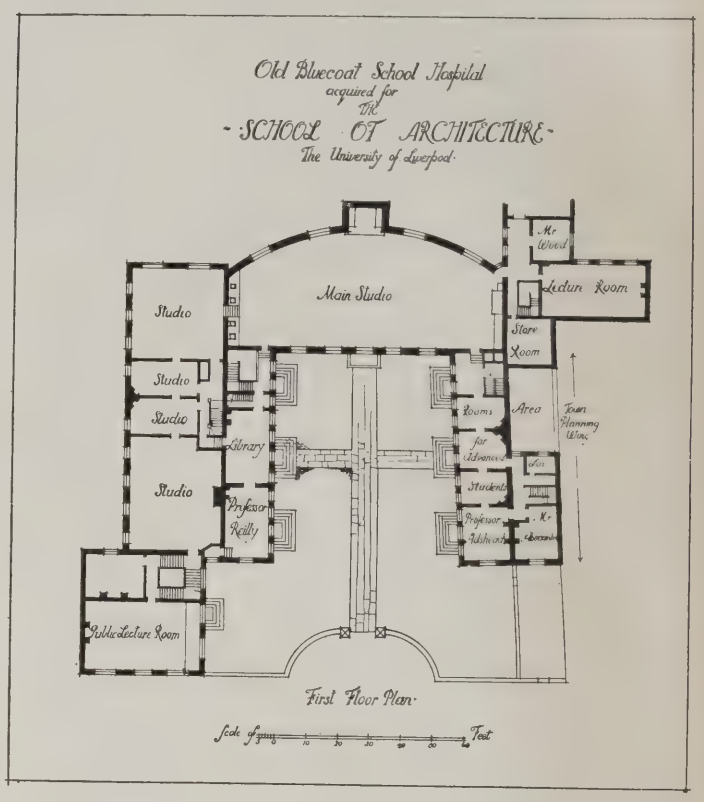
The frescoes, which appear to be of the same date as the church itself, include a Holy Supper of primitive execution, and some beautiful ornament, which, being somewhat dilapidated, does not reveal the name of the artist. There is a St. Julius, exorcising the serpents, in pure fourteenth century style, by Antoninus Gugliermi, of Antigorio (the artist's name being clearly legible), and a St. Catharine, with the Virgin and Child. The draperies and such of the figures as have been preserved, are very beautifully painted. A St. Michael weighing souls in a balance, seems to be of the same period. There is also a painting of the Eternal Father, which unhappily is much damaged. Last September, in the Apse, behind the only altar in the church, three life-sized figures in splendid preservation were discovered. They represent St. Quirico, St. Giulitta, his Mother and St. James, all magnificent figures, with beautifully shaped and life-like heads, and garments of brilliant colours. Other figures around the apse have not yet been opened up.

But the Holy Supper is the most important, and, indeed, the most interesting of the series. Distinctly archaic in style and drawing, it measures some thirteen feet by four feet six inches. Most of the figures are in splendid preservation, and above each is inscribed his name, those legible being, from left to right, Simon, Judas, Peter, Thomas, Thaddeus, James the Great, James the Less ("Jacobus ma" and "Jacobus mi") and Bartholomew. The figure of our Lord, splendidly fresh and clear, is represented as giving the Sop to Judas, while his left arm rests on the shoulder of the Apostle John, who leans forward on the table.

The drawing of the table is especially quaint, and without the least attempt at perspective. It is spread with bread, in the form of small round loaves, some two or two and a-half inches in diameter; fish, which lie on the table itself, without dishes; carafes of wine, and wine tumblers, which, curiously enough, are exact reproductions of the common glasses which are found in ordinary use in every little wineshop in Italy to-day.

The Art of Orchardson.

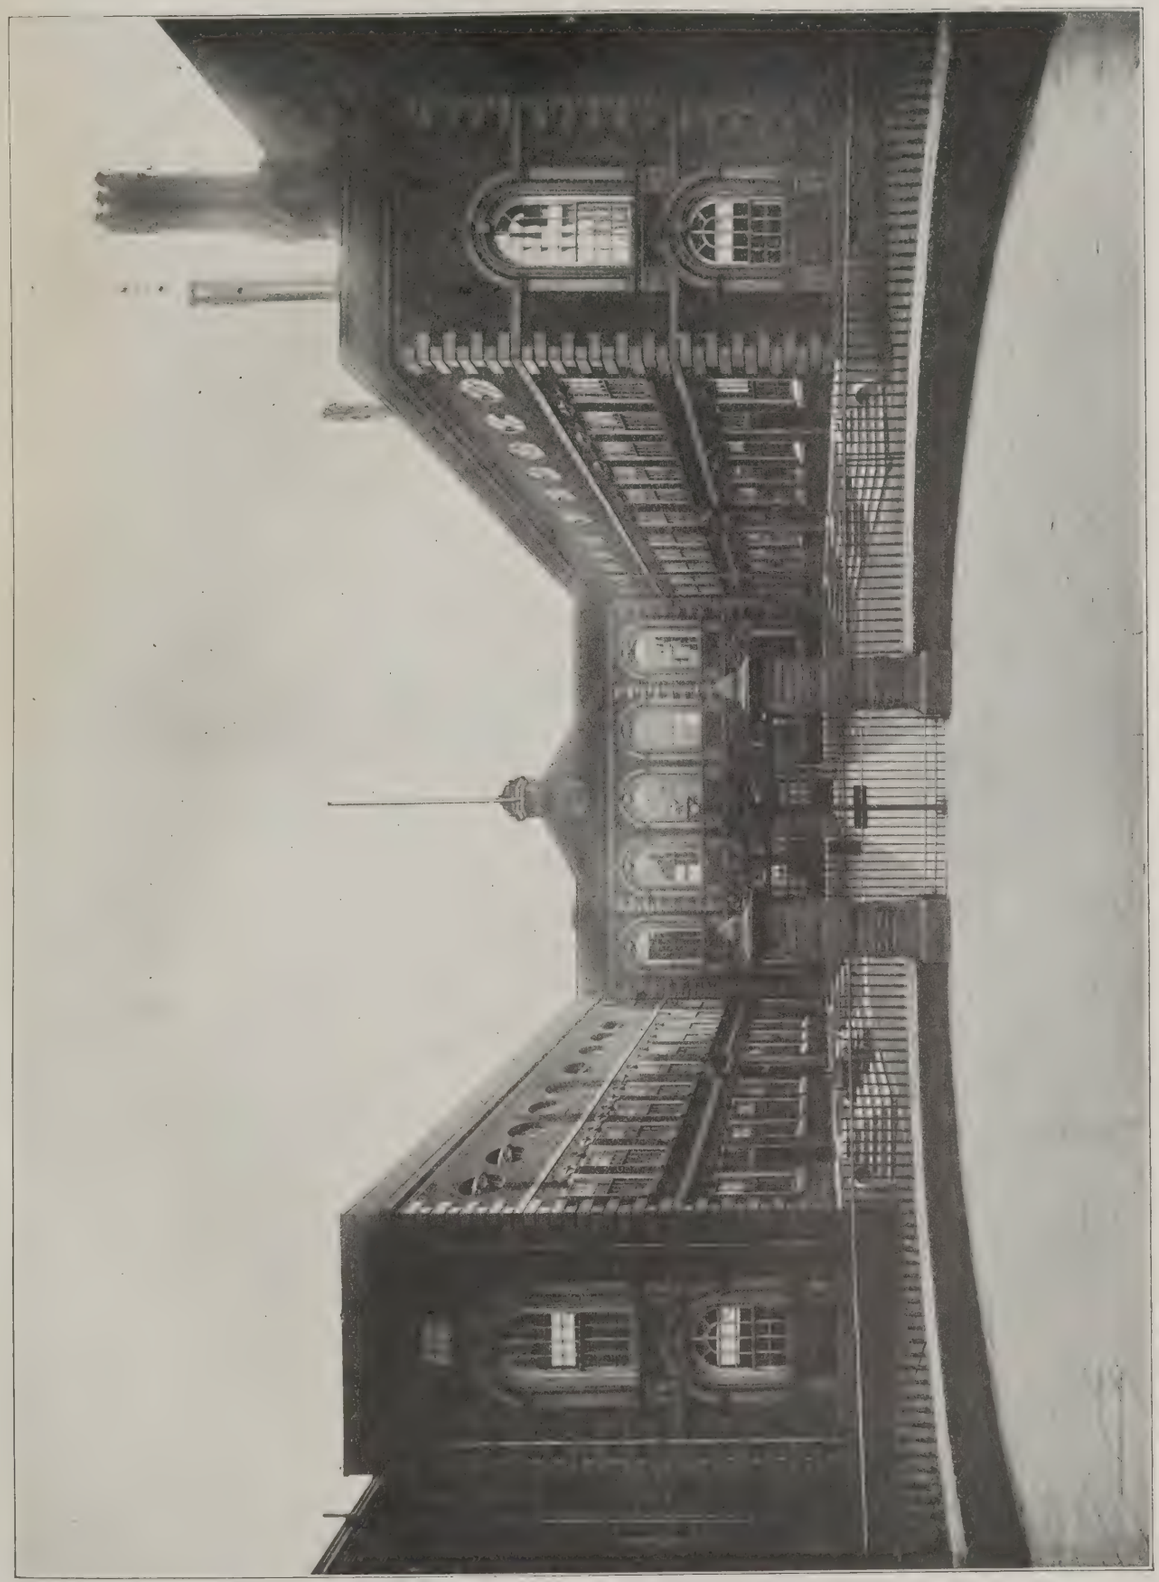
THE death of Sir W. Q. Orchardson removes from among us a painter who, if he did not belong quite to the first rank, stood very high in virtue of two qualities—viz., his refined sense of colour and his capacity for making his art, on occasion, a trenchant and powerful commentary on life. To make painting what Matthew Arnold said poetry ought (in a sense) to be—"a criticism of life"—is not the highest use of art, it is true; the highest object of art is to appeal to the sense of beauty; but to illustrate actual life and enforce a moral is one use of the art of painting, and one which is not to be despised, when it is done with such power and effect as it was by Orchardson in "Mariage de Convenance," "After," and "The First Cloud." These were pictures which compelled one to think of something besides painting. Others of Orchardson's works, such as "The Young Duke" and "Voltaire," were inspired by the love of the picturesque, of historic incidents, costumes, and ornament; and his "Napoléon on the Bellerophon" may count as one of the best pictures which the Napoleonic legend has evoked. But Orchardson had also the distinction of being a very fine colourist, with a scale of colour of his own, which always remained his own: he had in this sense no imitators. It would be difficult to define in what the peculiar element of his colouring consisted; but it was distinctly original and personal to himself. And one result of it was this: That he was able to paint a portrait of a man in an ordinary everyday costume—in tweeds or in a frock-coat; to leave the dress sufficiently realistic for the purposes of portraiture, and yet to secure in it a subtle harmony of colour unsuspected of tailors, and which completely removed the picture out of the region of mere commonplace realism. No other modern English portrait-painter had quite this special gift of adaptability in regard to colour in the treatment of everyday costumes; even Millais, in his portraits of men, though he was stronger in the depicting of character, did not show the same instinct as a colourist in this class of portrait.



NOTES AND NEWS.

The School of Architecture, Liverpool.

The Old Blue Coat School, which, through the generosity of Mr. W. H. Lever, has now become the home of the School of Architecture, was built in the years 1716-1717, and is a good and complete example of Queen Anne architecture, indeed, the only one Liverpool possesses. It is situated in a quiet side street called School Lane, but faces the main thoroughfare of Liverpool, Church Street, across the grass of the pro-cathedral churchyard. The architectural interest centres in the buildings surrounding the court, which were the first to be built, and have remained unaltered to this day. These the school now occupies. The main block facing the gateway consists of the dining-room, and chapel over it, now the exhibition room and the main studio of the school, two large rooms 90 feet by 40 feet, well lit with large windows on either side. The two wings were designed to accommodate 25 children each, girls on one side, boys on the other. As in a court of a smaller Cambridge college, three doors lead from the courtyard to either wing, though the dormitory plan above does not admit of separate staircases. Each door is emphasised by a little pedestal of stone steps, with a flagged walk leading to it, giving a most picturesque and charming effect. The windows in the flank walls, which are in excess in glass area of many a modern building, and give ample light for studio purposes to the interior, are set well to the face of the brickwork, and by their broad frames and astragal bars carry through the sense of wall surface without any feeling of weakness. Indeed, these side façades offer a very practical solution of the problem of an office building where light is important, for even the rooms with the oval windows are well and pleasantly lit. Externally the frieze of the elliptical windows under the cornice, well set in a field of plain brickwork, is a delightful feature. The materials are small hand-made red bricks and local sandstone. Liverpool, like the rest of the north of England, suffers from Ruabon red pressed bricks, so that on the score of brickwork alone the building was worth saving. The windows are glazed throughout with blown crown glass. Professor Reilly has not been able to ascertain the name of the architect or master builder, but the detail is the traditional detail of the period, with just a hint of Inigo Jones's influence in the main doorway opposite the entrance gates. An interesting motto on the chapel frieze, "Christianae charitati promovendae inopique pueritiae ecclesiae anglicanae principiis imbuendae sacrum anno salutis MDCCXVII.," explains the original purpose of the building—a motto we mean to keep now that the purpose is changed. It has been ascertained from old accounts that



THE SCHOOL OF ARCHITECTURE, LIVERPOOL UNIVERSITY: THE MAIN STUDIO.

the cost of the building in 1717 was only £2,000-£3,000; the agreed purchase price to-day is £24,000-£25,000. The purchase money has been provided out of the damages in the famous soap libel cases. In the eighteenth century the accounts also show it was possible to feed, clothe, and educate a boy at the hospital for £8 12s. a year, while his architectural successor to-day costs £30. That the training of the latter, however, will be the better for his new surroundings is not too much to hope for, and at any rate the thanks of architects are due to Mr. Lever, not only for saving so fine a building from the imminent destruction that threatened it, but also for giving it to the service of our profession.

Reviving Interest in Temple Bar.

Temple Bar, which in 1878 was taken down from its position at the western boundary of the City of London, near where now stand the Law Courts, and on a site that is now occupied by the much-abused Griffin monument, was in 1887 re-erected at the entrance to Theobalds Park, Cheshunt. Sir Henry Meux, in taking charge of this last of the City gates, undertook to relinquish all right to the structure in case he allowed it to fall into disrepair. The relic has been well preserved; but there has grown up, it is said, a strong desire on the part of certain influential citizens to make the old structure public property, which should be re-erected either in one of the open spaces in the City—such as Finsbury Circus Gardens—or in some spot that is easily accessible to Londoners, such as one of the entrances to Epping Forest. Lady Meux would, of course, be within her rights in refusing permission for the removal of the Bar, for which, however, a more appropriate site than that which it now occupies could assuredly be found. Temple Bar, which was built by Wren in 1670, consisted of a gateway, built of Portland stone. On its east side, in niches, were statues of Queen Elizabeth and James I., and on its west side those of Charles I. and Charles II. These were all carved by John Bushnell, who died in 1701. For a long time the interior of the Bar was leased by Messrs. Child, the bankers, as a depository for their ledgers. Outwardly, the Bar was frequently "adorned" with the heads (stuck on poles) of persons who had been executed; the last to figure in this barbarous and disgusting exhibition being those of rebels of the '45.

This very complete and interesting specimen of Queen Anne architecture has been purchased by Mr. W. H. Lever, M.P., and devoted by him to the use of the School of Architecture, Liverpool University.

THE OLD BLUECOAT SCHOOL, LIVERPOOL, NOW THE SCHOOL OF ARCHITECTURE, LIVERPOOL UNIVERSITY.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

St. James's, Piccadilly.

It is satisfactory to be able to record that a very objectionable proposal to build on part of the churchyard of St. James's, Piccadilly, has been negatived in Parliament by a large majority. The church authorities have had the right of making occasional use of the neighbouring vestry hall. The proposal recently brought forward was that the City Council should pay £2,000 to the rector and churchwardens in compensation for their abandoning this right of user, and that the latter should make use of the money to erect a mission hall or clergy house on the part of the churchyard between the church and Jermyn Street. The scheme is objectionable on two grounds; first, that the land is part of an old burial ground, and graves would have to be disturbed; and secondly, that the small piece of open ground there is a bit of open space in a crowded neighbourhood which can be ill spared. It may be added that no building could be erected on the space proposed without appearing to crowd up the church very much, and that the architectural results would be as unfortunate as the hygienic.

The Zona Monumentale.

Senator Luca Beltrami, the architect who restored the Castello Sforesco at Milan, has published, in the "Corriere della Sena," an important article on the Zona Monumentale controversy. He commends the action of Commendatore Boni, "the only competent and really responsible member of the Commission," in resigning his seat on that body rather than consent to "bury the goddess Rome beneath the macadam and tramlines of a 200-ft. boulevard." Of the five remaining commissioners, only one, it appears—Professor Lanciani, the archæologist—is at all trusted by the opponents of vandalism. Hope is now centred in the new Minister of Education, Signor Credaro, who, although he is but little of an archæologist, is a man of intellectual sympathies, and has, for instance, decided to recommend the planting of a sacred grove at Pietole, near Mantua, in commemoration of Virgil, and the erection of a shrine to the poet, as proposed by Boni.

"Palimpsest" Papering and Distempering.

The National Association of Master House Painters and Decorators of England and Wales (Incorporated) have issued a circular in which they draw attention to the grave prejudice to the public health which arises from the habit, now so prevalent, of papering walls of dwelling-houses on the top of existing papers. They declare that while the practice is more commonly found in cottage, tenement, and lower middle-class houses than in those of higher rentals, where the tenant is in a position to insist on more wholesome conditions, yet even these latter are not exempt, as the practice exists in classes of houses in which one would have thought it would not have been tolerated for a moment by the occupier. The former of these cases is the graver danger by reason of the lesser cubic space contained in the rooms, and consequent closer proximity of the occupiers to the walls and ceiling surfaces, and the generally crowded state of the community, but wherever the practice obtains the danger to public health is there. The accretion of decaying and putrid matter arising from the habit of hanging paper upon paper sets up germs of disease which must of necessity lower the health of the occupiers, and if it does not actually engender disease predisposes to it by lowering the general tone of healthy life. The association is of opinion that if our public authorities would take powers in their by-laws to compel owners of property in all cases to strip off the accumulated layers of paper, and cleanse the wall with a wash of some disinfectant before papering, it would be a tremendous step forward in the direction of public safety. Equally dangerous, from a health point of view, is the practice of laying one coat of distemper upon another, without first washing off the old colouring matter. The binding medium of all ordinary distemper is size made from animal or fish glue, and these, from their nature, are liable to rapid decay. If fresh when first laid on, under the alternation of the atmosphere of the dwelling, they absorb the moisture of the atmosphere, and immediately a process of decomposition is set up, and fœtid odours are given off, to the prejudice of all who come within their range. There is, for small houses constantly inhabited, only one safe course. That is to insist that every time the walls are redecorated by papering, or by distemper, the walls shall be first stripped clean to the surface prior to re-doing. Even if the obligation were imposed only when houses changed tenants and before they were reoccupied, it would be an immense gain, and would limit the accretions of paper or coats of distemper to those of a single tenancy.

An Old Thatched House at Norwood.

The only existing genuine old thatched house in the County of London was to have been pulled down "by the order of the L.C.C.," but efforts are being made to preserve it. The house, which is reputedly 300 years old, stands within the 30 acres of land at Norwood which has been acquired for conversion into a public park, and workmen had actually assembled with the object of destroying it when members of a local committee which had induced the L.C.C. to buy the land gave further proof of their persuasive powers by inducing the men not to begin operations pending negotiations with the Council. The house, as already observed, is the last of its kind in London; the thatched house in the Grove, Camberwell, being a modern building. The actual thatch of the Norwood house, however, it need hardly be said, must often have been renewed, and the present covering is obviously not at all ancient.

Big Ben's Bell.

In these days nothing escapes criticism. Since there are those who would "speak disrespectfully of the Equator," it is not surprising to find that Big Ben's bell has not been spared a similar indignity. Speaking at the Royal Institution on Saturday last, Mr. William Wooding Starmer said that the tone the bell gave was not so good as it should be. It had been badly used, as nothing but serious injury could result from the cutting of the holes in the sound-bowl. It was said that the holes were cut to ascertain the extent of the crack. There was no doubt that the crack only extended partially through the sound-bowl, but to what extent it injured the tone it was difficult to say. Speaking of the bells generally, Mr. Starmer said it was deplorable that in one of the most important buildings of the kingdom such bells should be used for the enlightenment of the British public every fifteen minutes of the day. It might well be asked, "Are we a musical people?" when such discordant sounds were allowed to pass as music. But in spite of Mr. Starmer, and possibly in defiance of all musical feeling, Londoners will go on loving Big Ben's old cracked voice, which is as music to their perhaps not over-sensitive ears.

Memorial Windows at Haslar.

Two stained glass windows which have been placed in the Chancel of the Chapel of the Royal Naval Hospital, Haslar, by naval medical officers and friends in memory of colleagues who have lost their lives on active service, were unveiled on Sunday week by Archdeacon Wood.

More Spade Work.

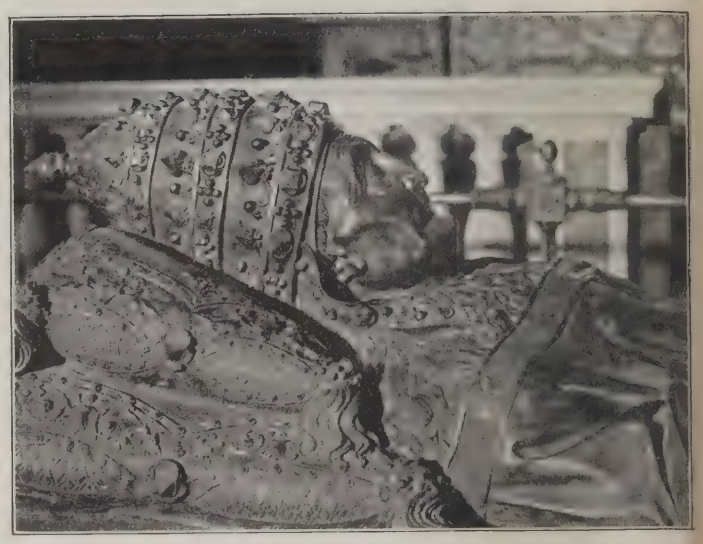
Dr. Duncan Mackenzie, acting for the Palestine Exploration Fund, is in Constantinople arranging to obtain a permit from the Turkish Government for new research work in Palestine. In a few days he leaves for Jerusalem to supervise the engagement of helpers for the excavation expedition and generally complete his plans. A sketch of the programme to be carried out was given on Saturday by an official of the fund. "We are hoping to commence the work as soon as possible after the permit is obtained," he said. "Dr. Mackenzie will be in charge on our side, with a Commissioner watching on behalf of the Turkish Government, and a foreman over the native workmen. A party of about fifty natives will be employed, selected from men who have had

previous experience of excavation work. The whole company will camp upon the site, living, I expect, in temporary huts. Every spadeful of earth turned up has to be carefully sifted, so that not the smallest relic may be overlooked. For many reasons we cannot make known the site for the excavations. If it were published, native dealers and tourists would at once flock thither. The site is extensive, and anything may be found there, from gold bars, perhaps, to ancient pottery. Everything excavated belongs to the Turkish Government, and will be placed in the museum at Constantinople. Although it is to be supposed that the principal finds will be mainly of interest to students of Biblical archæology, the architectural possibilities justify this brief notice.

Swing Doors in Schools.

The case of Morris v. Carnarvon County Council came before the Court of Appeal last week. A girl of six, a pupil in one of the Carnarvonshire provided schools, when leaving the classroom, did so by pushing through a swing door, which swung back and trapped her hand, crushing the fingers so badly that one had to be amputated. From the evidence it appeared that the door in question was fixed in the building before the Council took over the school. The County Court awarded damages to the child on the ground that the defendants were negligent in allowing such a door, which was a dangerous trap to children so young as the plaintiff, to remain. The Divisional Court affirmed this decision, and this view was confirmed by the Court of Appeal. School architects will doubtless make a note of this.

Marble in Skye.



The establishment of a prosperous marble industry in the Highlands would have somewhat revolutionary results. That such developments are possible the promoters of the new quarries which are being opened at Bradford, in the Island of Skye, seem to have full confidence, which they have manifested by importing from Belgium eighteen experienced marble cutters. It is claimed, indeed, and recent surveys by experts confirm the impression, that Highland marble may soon become a real competitor with the products of the famous quarries of Greece, France, and Italy. Much preliminary work is to be done before the marble can be placed on the market, and it was necessary to import skilled quarrymen from Belgium because the natives do not at present possess any knowledge of marble-cutting.

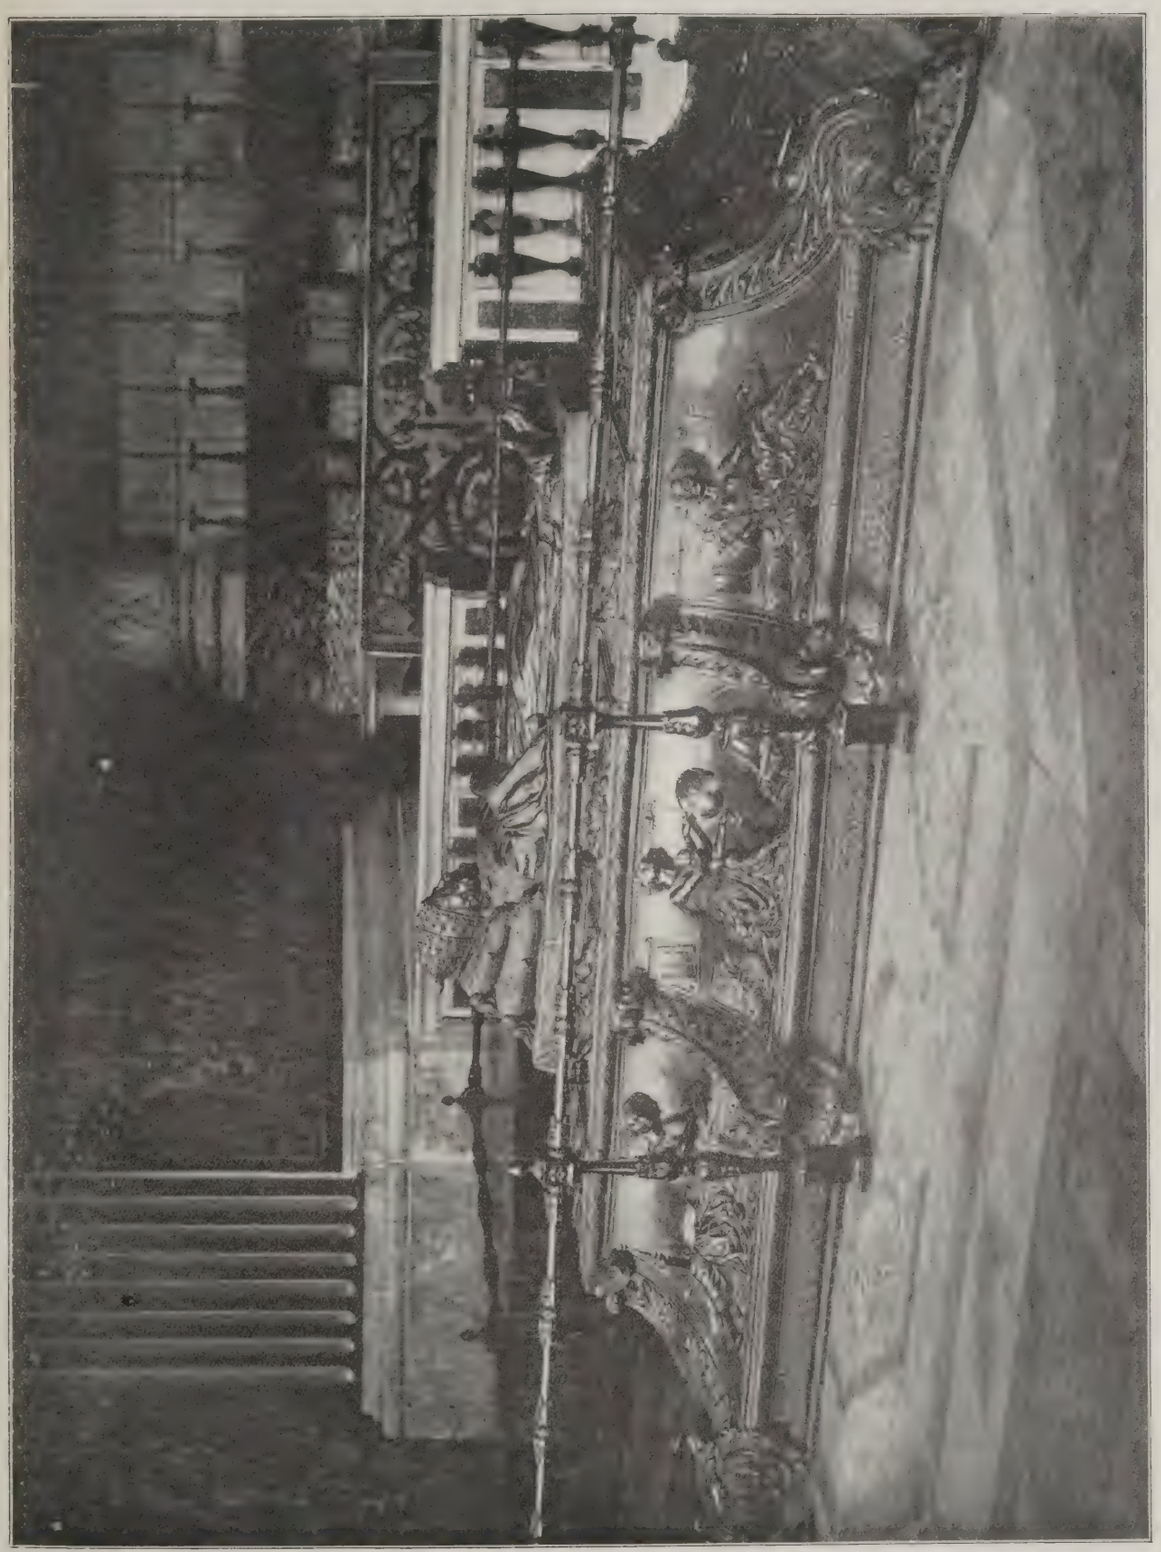
A Minor Sculptor of the Renaissance.

The Tomb of Pope Sixtus IV., in St. Peter's at Rome, is one of the masterpieces of Antonio del Pollajuolo, one of the Renaissance bronze-workers, who was born 1429 and died in 1498. He was known more, perhaps, as a painter, but it is difficult to look at the view and detail of the tomb of Sixtus IV. without realising his great capabilities as a sculptor. His other great work, the wall tomb of Pope Innocent VIII., also in St. Peter's, was carried out in conjunction with his brother, Pietro del Pollajuolo. Antonio acquired fame for his knowledge of anatomy, and the wonderful modelling of the face of Sixtus IV. is confirmation of the statement, often made, that his bent was rather towards realism than to idealistic treatment. Unfortunately this tomb is so badly placed and lighted that the beauties of the work are not well seen; but one cannot repress admiration for the sculptor who could model and successfully cast this wonderful figure and relief.

Town Planning Conference.

A Conference of all the local authorities within fifteen miles of Charing Cross having town-planning powers has been called by the National Housing and Town Planning Council for May 6. In London itself there is but one such authority—the County Council—but within the fifteen miles radius there are no fewer than seventy-nine bodies with power to adopt town-planning schemes. Every member of the London County Council will receive an invitation to the Conference, and the other authorities will be asked to send representatives. The principal resolution to be discussed will

DETAIL OF THE TOMB OF SIXTUS IV. ST. PETER'S, ROME. ANTONIO DEL POLLAJUOLO, SCULPTOR.



ask that each local authority should at once appoint a Town Planning Committee to study the powers given to them and to report on the administration of possible schemes to their Council. Another resolution will ask the Local Government Board itself to convene a Conference of local authorities in Greater London to consider joint action in regard to those features of town-planning which affect the development and amenities of Greater London as a whole.

Proposed Wilberforce Memorial.

The committee that endeavoured to secure the preservation of Battersea Rise House, Clapham Common, as a memorial to William Wilberforce now purpose to place a fountain or a statue on a portion of the site of Henry Thornton's old home, in which Wilberforce lived as a guest. A suitable piece of ground has been given. The committee now includes Mr. G. D. Faber, M.P. for Clapham, the Mayor of Battersea (Mr. P. P. Haythornthwaite), Canon Clarke, Dr. McManus, Dr. Richards (secretary), Mr. Shirley Benn, Mr. Edwin Evans, Mr. Henry Arding, and a number of other representative men in the district as well as several ladies. Canon Erskine Clarke, who for thirty-seven years was vicar of Battersea, is endeavouring to secure funds for a memorial church, a site for which has been secured on the Battersea Rise Estate. The feeling of the members of the committee at their meeting last Friday was that a further memorial which would appeal to the public generally was desirable. If funds are forthcoming they intend to embellish the fountain with a bust or medallion of Wilberforce.

Art and Registration.

Mr. George E. Bond, presiding on Friday evening at the twenty-sixth annual dinner of the Society of Architects, held at the Holborn Restaurant, was supported by a large company, which included Lord Saye and Sele, Mr. Atherley-Jones, K.C., M.P., Judge Rentoul, Mr. H. Nield, M.P., Mr. Ellis Marsland, Mr. Henry Tanner (President of the Architectural Association), Mr. Cyril Cobb, Alderman Max Clarke, and Colonel F. S. Leslie (hon. secretary). Mr. Bond, referring to the Architects' Registration Bill, claimed that a very large majority of practising architects in the United Kingdom favoured registration. If an art qualification were the only requirement in the practice of architecture, he would say that it should be left to its own free development; in the past all art teaching had been too dogmatic. As the modern practice of architecture involved scientific and technical knowledge and business ability as well as artistic taste, it was obvious that an artist without practical knowledge could not be an architect, and they desired to establish a definite minimum of these combined qualifications below which in the future no man should be entitled to style himself an architect.

MONUMENT OF SIXTUS IV. IN ST. PETER'S. ROME. ANTONIO DEL POLLAJUOLO, SCULPTOR.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

THE NEW PASSY VIADUCT, PARIS.

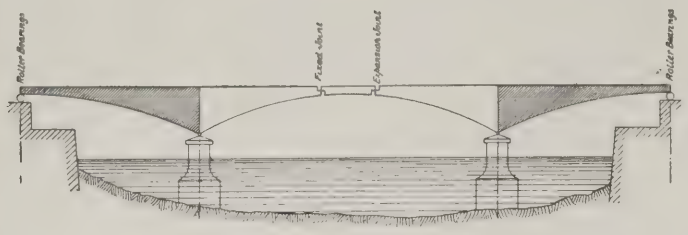
[*This description of the New Passy Viaduct is chiefly interesting for the indication it gives of the trouble taken by the French authorities to satisfy æsthetic considerations. This is evident not merely by the employment of an Architect and Sculptor in conjunction with the Engineers; but more particularly by the steps taken in adjusting the levels, and the pains taken to secure good "lines" for the new structure.*]

Most visitors to the French metropolis are familiar with the important masonry viaduct of the Chemin de Fer de Ceinture which commences near Auteuil Station and terminates with the Pont d'Auteuil; a massive structure built in the time of Napoleon, and of such strength and width as to permit the railway viaduct to be continued on its surface to the opposite side of the river.

Until recently, this was the only example of a double-deck bridge in Paris. A second one has now been added by the completion of the Viaduc de Passy, constructed for the Chemin de Fer Métropolitain, across the north-east end of the Ile des Cygnes, on the site formerly occupied by the foot-bridge known as the Passarelle de Passy, a structure erected in 1878 to facilitate communication between the Exposition of that time and the Quai de Passy.

The new bridge, which carries the Chemin de Fer Métropolitain for the second time over the Seine, follows an oblique line between the Rue de l'Alboni and the Boulevard de Grenelle. The railway, passing from the Place de l'Etoile, under the Avenue Kléber and the Rue Franklin, emerges from the ground at the side of the heights of Passy, and rises to the level of the viaduct.

The General Scheme.



The problem thus raised was not free from difficulties. It was necessary to carry the railway at the elevation demanded by its height above the streets on each side of the river, and so a double-deck bridge was clearly indicated, sufficiently light to cross the river with the last possible obstacle to navigation and the flow of water, and of such design as to avoid the creation of an eyesore in a favourite residential suburb. Another point for consideration arose from the different levels of the roadways on the two sides of the river. For instance, the Quai de Passy was 5.56 metres lower than the decking of the bridge over the cutting of the Ligne de l'Ouest, along the Quai de Grenelle. If this difference had been adjusted by constructing the viaduct with a continuous gradient the effect would have been particularly unpleasing, especially as the upper deck for the railway must have been kept level, and moreover it would not have been possible to provide the clear headway essential under the arches on the Passy end of the structure.

The solution adopted was one falling into line with the project formulated in 1885 by the Service de la Voie Publique for raising the Quai de Passy with the twofold purpose of affording protection against floods, and of providing for the substitution of a regular highway bridge on the site of the Passarelle de Passy. The Rue de l'Alboni was subsequently levelled up in accordance with this scheme, but for lack of funds it was not possible to deal in the same way with the quay, the two thoroughfares being connected for pedestrians and separated for vehicles by a stairway at the end of the street.

In the accepted design for the new viaduct, the roadways of the lower deck terminate at the height of 3.80 metres above quay level, and are continued in the form of two

I.—GENERAL VIEW OF THE NEW PASSY VIADUCT FROM THE RIGHT BANK OF THE SEINE, LOOKING WEST.

2.—DIAGRAM OF CANTILEVERS.

slopes, with the gradient of 7 millimetres per metre, curving out right and left parallel to the quay, causing no interference with the existing tramway lines, and according with the project for raising the general level of the quay, over which the elevated railway passes.

Fig. 1 is a general view of the works, as now executed, including (a) an approach viaduct along the Rue de l'Alboni and across the Quai de Passy, connecting the adjacent railway station with the end of the viaduct proper, the approach being 90 metres long, divided into five girder spans of approximately equal length. (b) A viaduct of 237.16 metres long, crossing the river on the skew of 75 deg. 14 min., and comprising two distinct bridges, each of three spans, and connected by a masonry arch on the Ile des Cygnes. On the Passy side the spans measure 29, 54, and 29 metres, and on the Grenelle side the spans measure 23, 42, and 23 metres, these dimensions being from centre to centre in each case. The total width of the combined structure at the level of the lower deck is 24.70 metres, providing accommodation for a central promenade 8.70 metres wide, two roadways each 6 metres wide, and two footwalks each 2 metres wide.

Above the promenade the decking of the elevated railway viaduct is 7.30 metres wide, this part of the structure consisting of parallel steel girder spans, supported at intervals of 6 metres by two rows of steel columns. The height of the lower deck is 8.50 metres above the normal level of the river, the deck of the railway viaduct being 7.50 metres higher.

(c) An approach viaduct of 57 metres crossing the Quai de Grenelle and the cutting of the Chemin de Fer de l'Ouest in a single span, and a small girder span connecting the viaduct with the Quai de Grenelle railway station.

The Passy Approach.

The Passy approach viaduct is built of two plate girders of I section 0.50 metre wide by 1.25 metres deep, spaced 5.65 metres apart, and connected by cross girders at intervals of 1.70 metres. Upon the latter are supported brick jack arches over which is laid the ballast of the permanent way. This form of construction is undoubtedly heavy, but was adopted with the view of deadening the noise of trains passing down the middle of the street. On each side of the main girders there is a steel plate footwalk for the use of railway employees, supported on cantilever brackets, joined by an ornamental cast iron balustrade outside. The viaduct is carried on two rows of cast-iron columns spaced so as to clear the roadway of the Quai de Passy.

The Grenelle Approach.

The approach viaduct of Grenelle is an example of the care taken to avoid unsightly proportions. If the parabolic form of girder usually employed on the elevated parts of the Metropolitan Railway had been adopted for this approach the depth of the girder would have been at least 5 metres. This of course was out of the question, and the designers were confronted with the task of providing for a parallel

3.—THE NEW PASSY VIADUCT, PARIS: THE MASONRY ARCH ON THE ILE DES CYGNES, CONNECTING THE TWO BRIDGES. THE SCULPTURE, REPRESENTING ELECTRICITY AND COMMERCE, IS BY M. INJALBERT.

girder of minimum depth without the possibility of applying intermediate supports either on the quay roadway or on the decking, which at that point covers the Chemin de Fer de l'Ouest.

The distance to be spanned being 55 metres (about 180ft.) it will be understood that the requirements of ample strength and minimum depth were not easy to reconcile, but by fixing the ends of the girders the total depth was reduced to 3 metres, and the result was to preserve the regularity of outline of the viaduct as a whole.

The main approach span comprises two parallel girders with a slight camber, connected by the decking and fixed at each end to two massive pillars terminated by hinged feet resting upon masonry foundations. The two pillars are connected by a portal arch transmitting to the masonry the horizontal thrust from bracing applied beneath the decking.

The Viaduct Proper.

In regard to the design and construction of the viaduct proper, it should be pointed out the soil beneath the bed of the river consists of plastic clay extending down to a considerable depth. Therefore, it was decided to adopt the cantilever principle in order to obviate oblique pressure upon the foundations, and thereby to keep to a minimum the thickness and weight of the abutments and piers. Fig. 2 is a sketch illustrating the nature of the arrangement adopted, where each double-arm cantilever is supported upon a masonry pier, the weight being adjusted so that the outer arm is capable of counterbalancing half the weight of the small connecting girder.

The Passy abutment is 30 metres long by 8.50 metres wide, by 15.30 metres high; and consists of a retaining wall 7.15 metres high by 3.30 metres thick at the base, having a skewback 1.40 metres wide to carry the end of the cantilever. At its extremities the abutment is connected by carved wing walls to the two retaining walls on either side of the slopes leading down from the bridge decking to the Quai de Passy. At their junction with the abutment the wing walls include angle pilasters, and they are finished with a parapet in Coutarnoux stone, which at one end joins up with the balustrade of the bridge, and at the other end is continued along the wall of the slope next to the river. The wall of the slope facing the quay is finished by a similar parapet. In order to give direct communication for foot passengers between the viaduct and the Quai de Passy, a stone stairway 10 metres wide and including twenty-five steps has been constructed at the end of the promenade running along the middle of the viaduct.

From the middle of the abutment rises a masonry tower 10.05 metres high, pierced by an arched opening 3 metres wide by 5.80 metres high, for the central promenade, and supporting the end of the approach viaduct as well as one end of the elevated railway viaduct over the bridge.

The pedestal of the tower is in cut stone from Souppes, the remainder being in Coutarnoux stone. A parapet at each side serves the purpose of covering the break between the approach and the upper deck of the bridge, the lateral faces of the tower being treated in appropriate architectural style.

The Grenelle abutment is similar to that on the other side of the river, the foundation measuring 30 metres long by 8.50 metres wide by 16.50 metres high. The viaduct roadways are placed in communication with the Quai de Grenelle by the covering over the Chemin de Fer de l'Ouest, and with the low-level quay by two slopes bounded on the side of the river by retaining walls built out from the abutment. A tower like that at the Passy end makes an appropriate link between the viaduct proper and the approach span, and provides also for the convenience of those using the central promenade.

The four river piers are of uniform design. Each foundation presents in plan the form of a rectangle terminated by a semicircle at each end, its length being 32.27 metres, and its width 7 metres. Each pier measures 6 metres wide at the base, and 4 metres wide above a point 1 metre below the normal level of the Seine, the difference of width being gradually approached by a concave buttress faced with scappled ashlar. The vertical face and the coping of each pier are faced with dressed stone from the Souppes, and the heart is of rubble in Portland cement mortar. On top of each pier is a block of granite 1.60 metres wide, upon which are fixed the hinged supports of the steel cantilevers.

The most imposing part of the masonry work is the monumental structure on the Ile des Cygnes connecting the two bridges. It includes abutments for the two cantilever bridges, a massive arched structure supporting the ends of the two elevated railway viaducts, and at the end of the island a large projecting buttress, constituting an efficient bulwark against the undermining of the main work by scour.

The masonry structure measures 58 metres long in the direction of the river, 24 metres wide, parallel with the axis of the viaduct, by 23.55 metres above foundation level. The

4.—A FISHERMAN: FIGURE ON THE SPRINGING OF CANTILEVER ARCH. M. GUSTAVE MICHEL, SCULPTOR.

foundations comprise piles driven into the clay, and a platform of lime concrete 2 metres thick.

Between the ends of the lower decking are two walls in dressed stone, forming abutments, each having a recess for the supports of the cantilevers, the intervening space being filled in to the height of about 4.50 metres below the roadway, the remaining interval being occupied by a masonry chamber whose object is to eliminate the outward pressure that would be exerted against the walls by earth filling. Both walls are prolonged up the river from the viaduct to form the massive buttress at the head of the island (see Fig. 1), the end of the structure being protected by a cutwater, surmounted by ornamental masonry. The surface of the buttress constitutes a terrace, around which is a stone parapet. On the other side of the viaduct a stairway with masonry balustrades gives direct access to the down-stream portion of the island.

Above road level the superstructure takes the form of a monumental gateway, built in dressed stone, with a basket-handled arch having the span of 9 metres, the rise of 3.64 metres, and the clear headway of 6.23 metres at the crown. In addition to this arch, which is parallel to the axis of the Ile des Cygnes, two small arches of 3 metres span are provided for passage of the central promenade along the viaduct.

The monument is surmounted by an entablature, on the up-stream and down-stream faces of which are masonry shields and other decorative work (Fig. 3).

The Decorative Features.

One gratifying feature connected with the Viaduc de Passy is that all the architectural and decorative features of the work were executed from the designs of M. Formige, architect to the City of Paris, with the co-operation of three well-known sculptors—M. Gustave Michel, M. Coutan, and M. Injalbert.

The exterior trusses of the main bridge spans are designed with a series of spandrel arches, architecturally treated in accordance with a uniform scheme, and are finished by a projecting cornice, supporting handsome cast-iron parapets, the cornice being carried in part by corbels, one at every upright in the spandrels.

Above each river pier the springings of the cantilever arches are decorated by groups of statuary, modelled by M. Gustave Michel and cast by M. Capitain-Geny, of Bussy, the eight groups required for the upstream and downstream sides of the viaduct having been reproduced from two models, one representing ironworkers and the other fishermen. Three figures from these groups are illustrated on this and the preceding page, in Figs. 4, 5, and 6.

The masonry towers supporting the ends of the elevated railway viaduct are enriched by sculptural details, and special attention was paid in the same way to the monumental arch on the Ile des Cygnes. The two principal faces of this work also bear bas-reliefs over the spandrels of the main arches. On the upstream face there are two figures by M. Coutan symbolical of Science and Work, and on the downstream face two figures by M. Injalbert representing Electricity and Commerce.

5.—AN IRONWORKER: FIGURE ON SPRINGING OF CANTILEVER ARCH. M. GUSTAVE MICHEL, SCULPTOR.

6.—AN IRONWORKER: FIGURE ON SPRINGING OF CANTILEVER ARCH. M. GUSTAVE MICHEL, SCULPTOR.

For the lighting of the viaduct, electric lamps, arranged in specially designed lanterns, are hung in parallel lines between the columns supporting the upper viaduct, the lights being automatically switched on and off at the proper time by an ingenious arrangement installed in the chamber between the abutment walls on the Ile des Cygnes, the device in question requiring adjustment only once a week.

It has been suggested in France that the Viaduc de Passy is the first double-deck bridge constructed entirely in metal. That distinction clearly belongs to Stephenson's high-level bridge at Newcastle, which for more than sixty years has been in continuous use by road and railway traffic, and is capable of bearing the weight of modern rolling-stock.

The structure at Passy, however, is worthy of notice, not only on account of the manner in which various difficult constructive problems have been solved, but also as a praiseworthy attempt to deal with steelwork in accordance with the æsthetic considerations inseparable from the design of bridges in large cities.

Notes.

The footbridge which was removed to make room for the railway viaduct had to be reinstated for the convenience of the public, and in order to facilitate the execution of the foundation work, and the subsequent masonry construction, the old Passarelle de Passy was re-erected at the distance of 30 metres from the site of the new viaduct, and although this involved considerable expense, it is stated that the outlay was more than repaid by the saving of time that was effected in consequence of its adoption.

Only one accident occurred during the progress of the foundation work, and it was not attended by serious results. The passage of a steamboat at full speed set up a powerful swell and damaged the plant connected with the sinking of the foundation of the pier nearest Passy, making it necessary to finish the work by the aid of a cofferdam.

We are indebted to M. Formige, architect to the City of Paris, for the photographs from which the illustrations to this article have been reproduced.

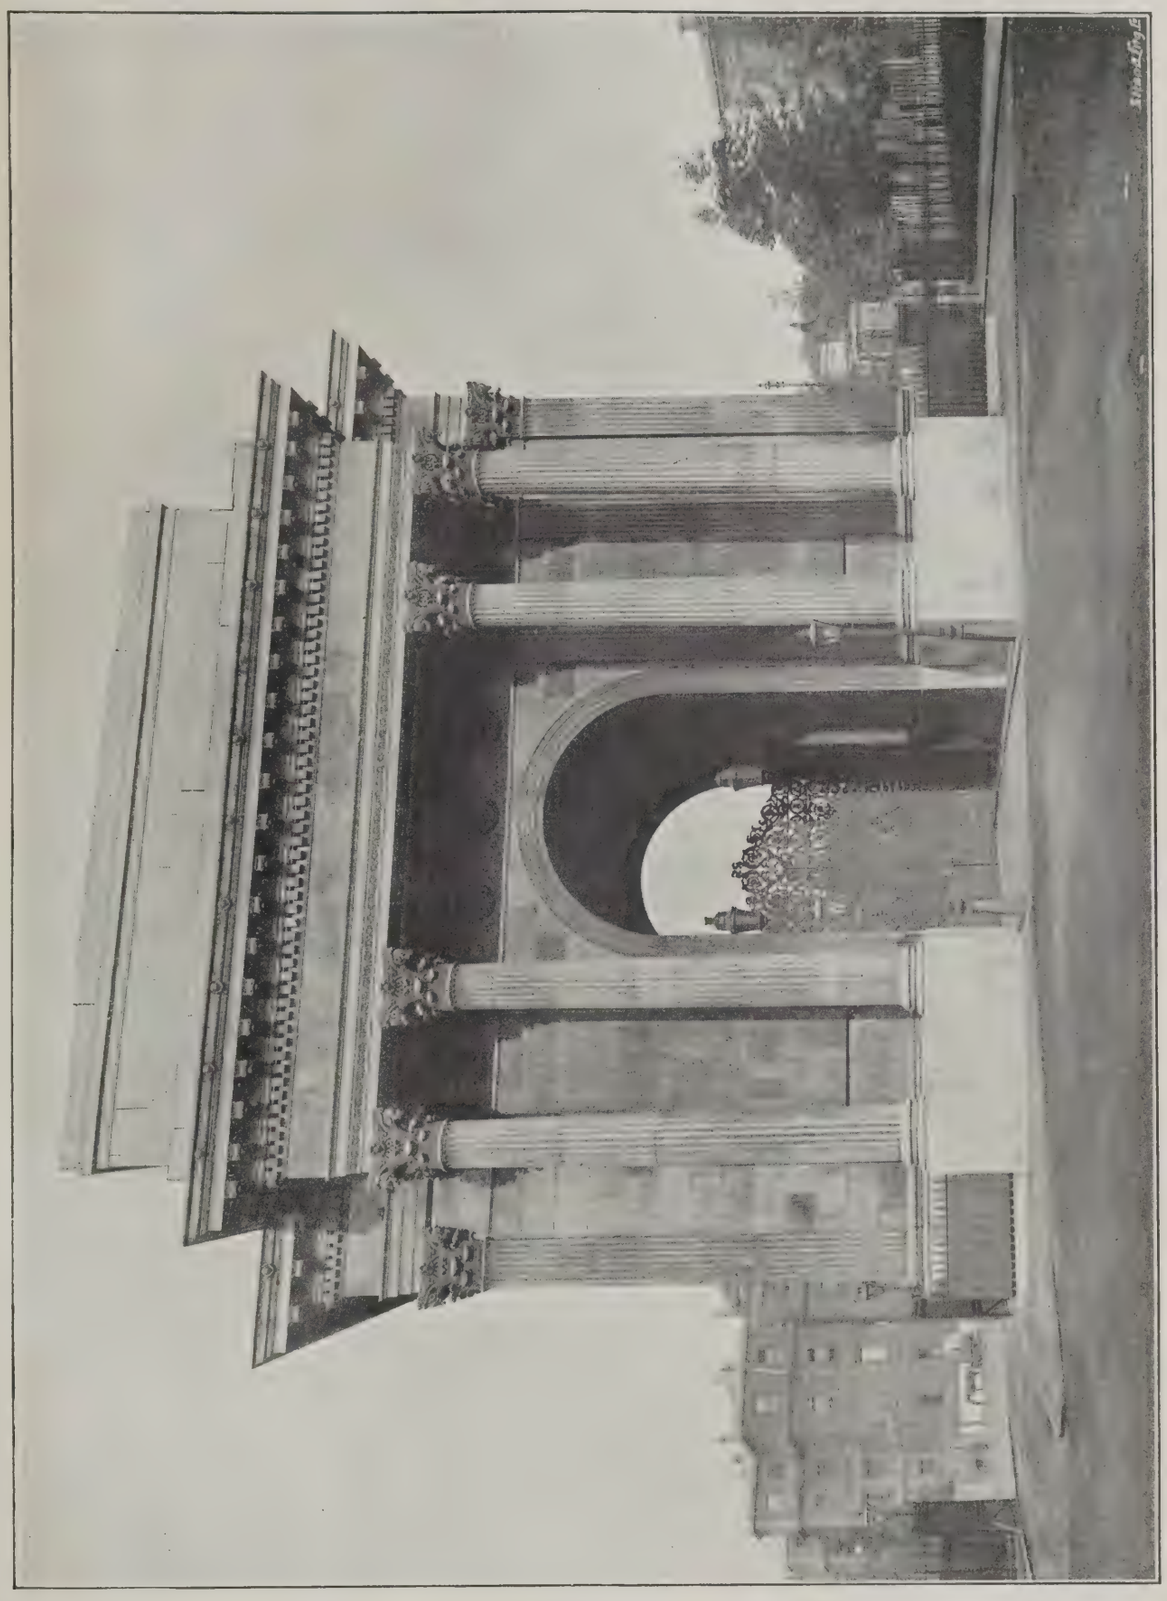


Photo: E. Deckree.

This arch will shortly be surmounted by a quadriga designed by Captain Adrian Jones, of which a photograph has been published in our pages. The statue of the Duke of Wellington, which formerly stood upon the arch, is now at Aldershot.

THE WELLINGTON ARCH, CONSTITUTION HILL, LONDON. DECIMUS BURTON, ARCHITECT.

OBITER DICTA.

The Charm of Renaissance Gardens. One great charm of Renaissance gardens was the skilful manner in which Nature and Art were blended together. The formal design of the *giardino segreto* agreed with the straight lines of the house, and the walls, with their clipped hedges, led on to the wilder, freer growth of woodland and meadow, while the dense shade of the *bosco* supplied an effective contrast to the sunny spaces of lawn and flower bed. The ancient practice of cutting box-trees into fantastic shapes, known to the Romans as the topiary art, was largely restored in the fifteenth century, and became an essential part of Italian gardens. In that strange romance printed at the Aldine Press in 1499, "Hypernotomachia" of Francesco Colonna, Polyphilus and his beloved are led through an enchanted garden, where banquet-houses, temples, and statues stand in the midst of myrtle groves and labyrinths on the banks of a shining stream. The pages of this curious book are adorned with a profusion of woodcuts, by some Venetian engraver, representing pergolas, fountains, sunk parterres, pillared *loggie*, clipped box and ilex trees of every variety, which give a good idea of the garden architecture then in vogue.—*Julia M. Ady, in the "Nineteenth Century."*

Two Views of Colour. The majority of the paintings in this exhibition [that of the Royal Society of British Artists] are by artists of the old school. To them picture-making consists primarily in the more or less careful selection and arrangement of form; colour being merely an arbitrary and often very disturbing addition, with no real bearing on the structure of the work. Yet among these examples we find signs that the modern notion of colour as the very basis of the structure of a picture is gaining ground.—"*Athenæum.*"

The Growing Beauty of London. The walls which have so far masked the new arched way which will give entrance from the Mall to Trafalgar Square have now been removed on the Mall side, and one can see what an impressive addition this work will make to the beauty of London. Passing along the Mall from Buckingham Palace the beautiful building with its triple arches crowns a charming vista. The arches have a noble spring, giving an air at once of strength and lightness. The over-erection has the appearance of being a little heavy, and it would seem that a slightly better effect would have been got if it had been somewhat higher and on a level with the sky-line of Carlton House Terrace. Later, when the concealing walls and disfiguring buildings on the Trafalgar Square side are removed, there will be caught through the arches from the leafy quietness of the Mall a glimpse of the surging traffic of the Square and the Strand; at present that view is spoiled, but the new architectural feature gives the Mall a charming finish. Some day the Mall should rank as one of the finest pageant thoroughfares in Europe.—"*Daily Telegraph.*"

Town Planning. Nothing could be more wholesome and salutary than that the public mind should be excited about town planning, and evidently our school of architecture is determined that the people of Liverpool shall enjoy this excitement.—"*Liverpool Daily Courier.*"

COLOURED RELIEFS AND MOSAICS.

By R. ANNING BELL, R.W.S.

[Mr. Anning Bell, an abstract of whose lecture at the Carpenters' Hall is given below, has made these two branches of art work his special study; and his work in coloured relief is particularly well known. His paper contained some useful suggestions on the suitable positions for these respective methods of decoration, and some interesting practical notes concerning them.]

I propose to begin, he said, this evening by describing to you two methods of decoration suitable to wall surfaces of a considerable area. Mosaic cannot be used to advantage except over a considerable area. Coloured relief is attractive in small spaces, but its proper use is for friezes, panels, and walls of a goodly size.

Suitable Positions for their Use.

Before going into details, I want to go into the question of how they are best used and the particular wall surfaces which develop their respective qualities most satisfactorily. A wall to be covered by mosaics does not need to be so well lighted as that which is intended for colour relief. Small lights such as those round the apse of St. Mark's, Venice, are the best treatment we can have for mosaics; these numerous small windows give a most sumptuous effect. The basilica shape of the church, with its nave and aisles, small transepts and apse, is the earliest form, but does not give mosaic the opportunity of showing its full beauty. This method of decoration is the child of the architecture by which it is developed. Mosaic for several centuries was used as the decoration for basilican-shaped churches. It is probable that the apsidal ends were the only parts decorated with mosaics; and seeing the beautiful effect of the light on the curved surfaces, the architects probably thought that these might be extended. Churches such as St. Vitale, at Ravenna, and St. Mark's, Venice, resulted from the experience of architects who had observed its beauty on curved surfaces, and so made plans to increase their opportunities for obtaining these effects. St. Mark's, of all that I have seen, is the most beautiful and best architectural setting for mosaics; its curved surfaces and scattered lights give the subdued effect and air of mystery so necessary for mosaic work. Mosaics should be above the eye and in large surfaces. When in small pieces it looks quite trumpery.

No Mouldings with Mosaics.

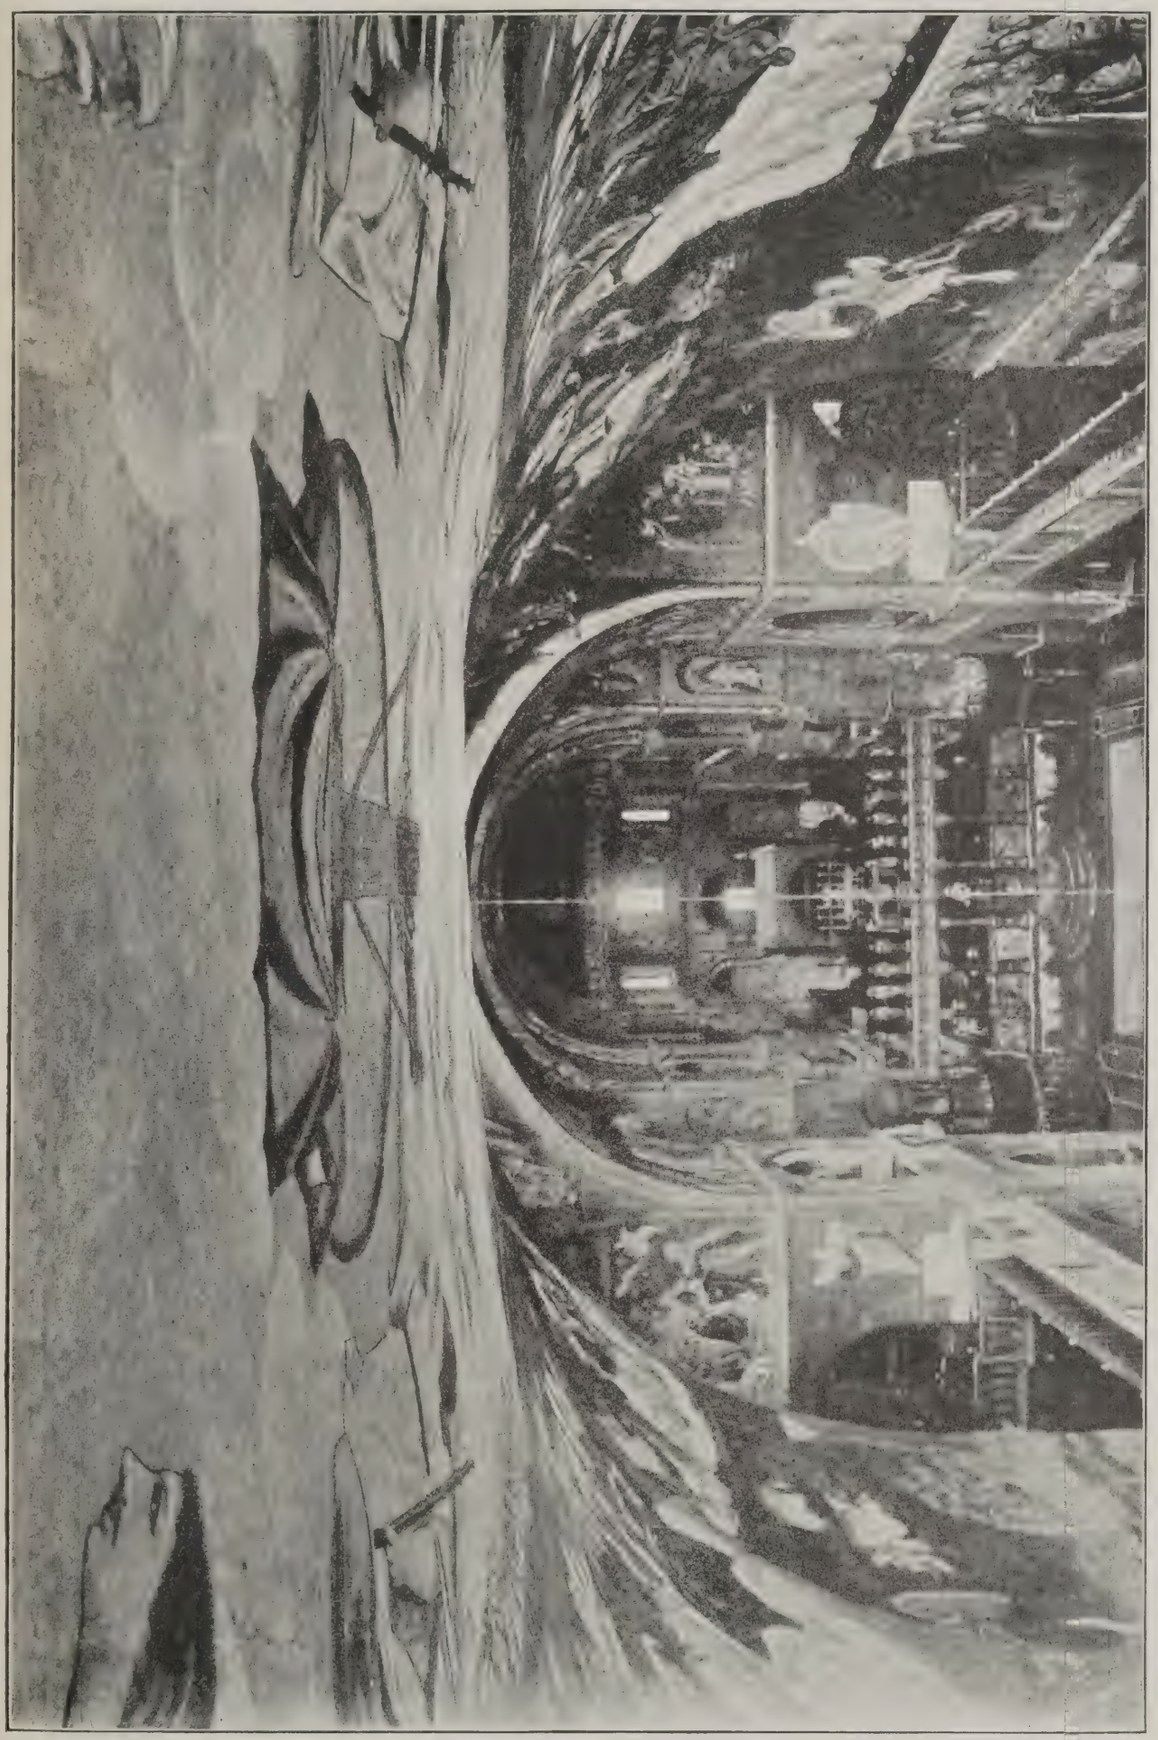
Having dealt with the necessity for eliminating mouldings when using mosaic, the lecturer proceeded to point out that where it is used no other colour is wanted —stained glass fights with it, and nothing else can live where there is mosaic.

Coloured Relief.

I intend to dwell at greater length to-night on coloured relief, because it has not attracted the attention of so many good masters as mosaic. One sees coloured reliefs—of a sort—all over the place, in every theatre and music hall, but one seldom sees one with any kind of originality. They are usually modelled by one person, coloured and gilded by another. Any colour scheme in which colour plays the principal part must be modelled in colour. Then the subject chosen should bear some relation to the building of which it forms a part, for example, a church. Stories from the Bible or lives of the Saints would be suitable; for a town hall, examples of civic virtues and social duties, etc. Each building will suggest what is a fit subject for its decoration. When the subject has been settled the next thing to decide on is the scale and the ornament. Get out a sketch of the whole scheme in colour

The Colour Chart.

Although this sketch gives no idea of the effect of the whole, yet it is extremely important, as if the work is slightly changed this colour scheme is a map. It is of great importance to decide on the colour spaces in the map, because when the whole surface is a sheet of clay we shall get lines which seem more agreeable and which will be difficult to resist. Having settled the scale of the colour scheme, the next thing to proceed with is the modelling. My experience has been chiefly in clay and plaster, and I will talk of these. The amount of relief given will depend on the lighting and the position in which the work will be placed. If high up, the modelling needs to be bold. It never needs to be in very high relief to get the best colour effect. A very slight relief makes work tell more distinctly at a distance. Work high up wants to be in simple planes. The great thing is to get the drawing good and the masses of colour well distributed.



The Clay Model.

When the clay model is finished it can be cast in plaster and then fired into "biscuit." The objection brought against the plaster work is that it is not durable. The biscuit cannot be broken with a hammer. In either case, whether it is to be executed in biscuit or plaster, you have to stop the suction of the surface before painting. The best thing I can find for this is white shellac. This should be dissolved in spirits and put on in several coats. When the ground is thoroughly stopped, proceed to gild what parts are required, whether to show or as a ground for colour. After this gold has been applied and a few days allowed for it to set, proceed with the colour. I use ordinary artists' oil colours with a little wax and turps. You can use tempera, but it must not be cleaned or sponged for several days after this.

A Sense of Colour.

Of course, in colouring, anything approaching realism is undesirable. For getting variations of light and shade you can work in opaque or transparent colours. Experience alone will tell you what can be done. You want most particularly a sense of colour. You can add patterns, but the essential thing in this work is to keep the colour in mind, especially when doing the modelling. You have little hollows where you want shadows, as in the folds of a dress, and little ridges where you want light, and so vary the surfaces so as to get variety in the quality of the colours. Strong colour is the best, but no colour has its full value in this material on account of the inequality of the surface on which it rests.

Some slides were here shown, including a reredos from Park Church, Glasgow; an overmantel, an altar-piece from the Scandinavian Church at Liverpool; and a panel in the Skinners' Hall, all executed by Mr. Bell. The Royal Chapel at Palermo, of which an interior view was given showing the decoration, was, Mr. Bell said, one of the finest examples of mosaics in the world. The cathedral at Monreale, built in thirty years, shows one style throughout.

ST. MARK'S, VENICE: A CURIOUS VIEW FROM UNDER THE ROOF, SHOWING THE MOSAICS, AND THE DEFLECTION OF THE VAULT OF "THE PARADISE."

LIBRARY

The Technique of Mosaic.

A mosaic decoration consists of pieces of glass, differing in size, much of the old work being from ¼in. to ⅜in. square. Old work is always rather small. The interstices between these pieces are unequal, and can be made to vary the quality of the work. They are sometimes coloured. The quality given by these interstices to the work gives a monotony to the surfaces. They give a flatness and an austerity to the design eminently agreeable. The fact that colour masses in mosaics are not as prominent as a single piece of glass is on account of these interstices and the shine on them due to uneven surfaces. Another reason is that many of them are nearly transparent, and so both tend to lower the tone.

Here, after the work has been settled and the coloured cartoon made of the whole work, the tesserae are marked over them. The lines of these are very important, as upon them often depends the success or failure of the work. These cartoons may be made in water colour, oil, or pastel. I use water colour myself if the work is to be done *in situ*.

Methods of Mosaic Workings.

There are two methods of doing the work. In the first the cartoon is laid on the floor, and the tesserae matched to the colour and then laid on the spot. These are then floated over in cement and a slate laid on them and allowed to set, then turned over. The difficulty about this method is that one can never see the front until the work is completed, also the tesserae come out looking flat and mechanical. Another disastrous effect of these slabs of slate is when they are put up *in situ* in a curved surface they have a most unfortunate appearance. I prefer the second method, which is longer and more costly, but you can see the work all through. First the wall on which the work is to be placed should be soaked with boiled oil, which seems to help the putty; then leave for a day or two and apply the putty to the surface, or as much as you can do before the putty gets hard. This should be ¾in. thick. The tesserae should be made from glass rondeaux, and should be picked out from the tracing of the cartoon and pushed into the putty. An early form of putty consisted of slaked lime and marble dust in the proportion of 1—3. Another recipe is marble dust, boiled oil, and slaked lime. Care should be taken if the building has a southern aspect that the material is not affected by the sun's rays. The skill of the executant varies greatly, and a great deal depends upon the taste of the individual; and the designer should be constantly in touch with the workmen. Mosaic has limitations which should be studied and noted. No decorative scheme is more delightful when properly used, and nothing is more disastrous in effect when used outside its scope.

NEWS IN BRIEF.

The Chenavard prizes have just been awarded by the Ecole des Beaux-Arts as follows: 1 (900 francs), equally divided between MM. de la Bouglise and Mauxion; 2 (400 francs), M. Bray; 3 (300 francs), M. Alleman. The Académie des Beaux-Arts has awarded the Duc prize (3,700 francs), for the encouragement of the higher architectonic studies, to M. Chaussemiche for his designs for a hydro (établissement thermal) at Châtel-Guyon.

* * *

The death of Sir William Quiller Orchardson, R.A., last Wednesday, removes one of our most popular painters of figure subjects, nor was he a mean portraitist. Born in 1835, he was one of the very successful band who studied at the Trustees' Academy, Edinburgh, under Robert Scott Lauder, along with Thomas Faed, Peter Graham, John Pettie, and John MacWhirter. There was doubtless a good deal of sentimentality about his popular successes (of which "Hard Hit" is probably the best known), but his technique was always masterly. He was elected A.R.A. in 1867, and R.A. exactly ten years later. He received the honour of knighthood in 1907.

* * *

Professor S. D. Adshead informs us that at the examination at the end of the first session of the School of Civic Design at the University of Liverpool, the following students have been successful, and will be awarded the certificate in civic design: Messrs. G. N. Dixon, S. A. Kelly, B. J. Pearson, and F. B. D. Stalker.

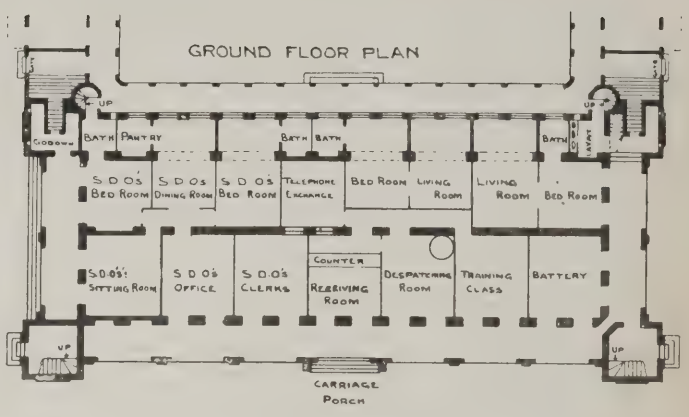
* * *

The annual general meeting of the Glasgow Institute of Architects (Associate Section) was held in the rooms on Wednesday, March 27th. A very satisfactory report was read and approved, and the following committee was elected: Messrs. A. M. Gardner, A. Wright, J. Wright, H. Higgans, E. G. Wyllie, T. Lunan, J. A. Wilson, Alex. Davie, Wm. Vickers, jun., and A. Newton. Mr. Alex. Wright was appointed chairman, and Mr. J. Arch. Wilson, 92, Bath Street, was again elected hon. secretary.

* * *

The Emigration Office is circulating a warning to the public that the system of paying premiums (or any sum above the ordinary steamship and railway fare) in this country, to gain instruction in farming in Canada is liable to grave abuse, and is considered by the Canadian Government to be unnecessary. Young men who are going to Canada in order to obtain a knowledge of farming are strongly advised to pay no fee of the kind to any private agency, but to apply for information to the Canadian Assistant Superintendent of Emigration, 11 and 12, Charing Cross, London, S.W., or to the Chief Clerk at the Emigration Office, 31, Broadway, Westminster.

HIGH SCHOOL AHMEDABAD, INDIA.
(See Leader: "Architectural work in India.")



A new brickmaking material that is being employed in Denmark is locally called *moler*, and is described as "a foliated diatomaceous deposit found in Jutland." The Danish States Testing Laboratory has succeeded in producing from it a fine red brick, very firm and light and of such toughness that a nail could be driven through without cracking it. The bricks, while remarkably strong in proportion to their slight weight, are too porous and absorptive for external use, but are suitable for every kind of indoor work.

* * *

For the bearing it may possibly have on building prices, it may be here noted that last Thursday the United States Steel Corporation announced that they will advance the wages of their 205,000 employees on May 1st, increasing the pay-roll by nine million dollars (£1,800,000) annually.

* * *

Mr. Arthur T. Walmisley, M.Inst.C.E., engineer to the Dover Harbour Board, in a paper on "The Port of Dover," read before the Royal Society of Arts, touching upon the many schemes proposed at various times for reaching the Continent, pointed out that in order to build a bridge, it would be necessary to find foundations below water at a depth of twenty-nine fathoms, or 174ft., in the deepest part of the channel. He mentions that the reclamation works east of the Admiralty pier would provide a site of 11½ acres attached to the pier for a railway station and sidings, and would include a deep-water landing stage 780ft. long and 20ft. wide.

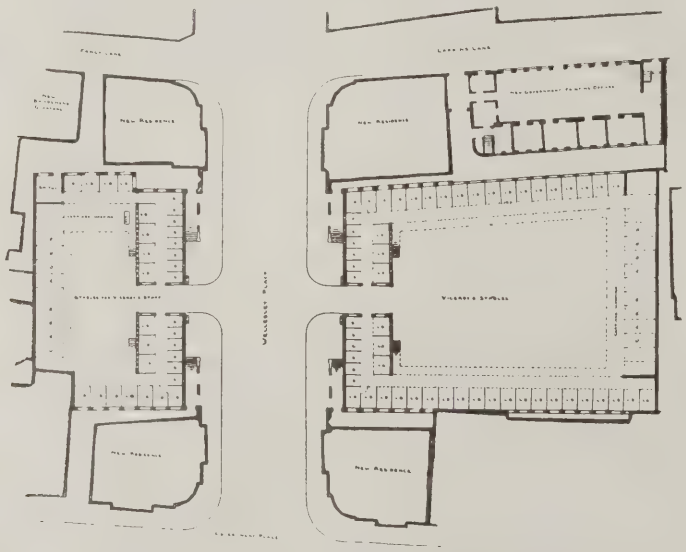
The twentieth Salon of the Société Nationale des Beaux-Arts was opened at the Grand Palais on April 13th by the President of the French Republic. The critics pronounce it above the average.

* * *



The Battersea Borough Council have decided not to rescind a resolution (passed by the Vestry fifteen years ago) which fixed the minimum wage for the employees at 30s. and the hours at 48 per week. Two deputations attended and protested against any change. Had the resolution been passed the Council would have been asked to consider proposals for introducing trade union conditions and the practice of other councils.

* * *

The proposed extension of the Charing Cross, Euston, and Hampstead Railway from the present terminus at Charing Cross to the Embankment has been for the present abandoned, owing to the objections or difficulties with respect to tunnelling under the Hôtel Métropole or, alternatively, under the pillars of the South-Eastern and Chatham Railway bridge. The Bill has been therefore withdrawn from the House of Lords

* * *

A Committee of the House of Lords, presided over by the Earl of Kintore, passed, on Wednesday last, the Bill authorising the Cambridge University and Town Waterworks Company to raise further capital for the extension of their undertaking and the sterilisation of the water supplied to the University and town of Cambridge and the surrounding district. The original intention was to construct, at a cost of £167,500, new works in the rural district of Chesterton; but the sinking of certain wells having become unnecessary that figure will be reduced by about £44,000. When the Bill reaches the Commons, it will probably be opposed by the Corporation of Cambridge, who complain that their powers of purchasing the waterworks and carrying them on as a municipal undertaking may be prejudiced.

NOTES FROM FRANCE.

The Municipal Council of Paris is occupied about a proposal for purchasing an hôtel built some years ago in the Place Malesherbes by a rich art collector named Gaillard. The façade, in stone and brick, is a reproduction of part of the Louis XIIth wing of the Château of Blois. The house cost 11 million francs, and is now offered for sale at 2 million. This is, of course, a tempting bargain, and it is proposed to buy the place and make it a museum to receive the Dutuit collection, now in the Petit Palais. The proposal is a good deal criticised, the house being only a modern imitation of old work, and it is thought that the Council might spend the money much better in purchasing the ancient Hôtel de Sens, built at the end of the fifteenth century by the Archbishop of Sens, Tristan de Salazar. This and the Hôtel de Cluny (the well-known museum) are the only examples of fifteenth-century domestic architecture still standing in Paris; and the Hôtel de Sens, unless officially purchased, is likely to be destroyed. As it is near the Faubourg St. Antoine, it would be an excellent place for a museum of applied art for the benefit of the artisans of this quarter, who never get as far west as the Galliera Museum.

* * *

The Department of the Marne has advertised a competition, open to all French architects, for a new Palais de Justice at Reims, at a proposed cost of 1,700,000 francs.

* * *

Parliament has passed a law prohibiting from henceforth the affixing of any advertisements or trade announcements on buildings classed as "monuments historiques," or in any places of picturesque or historic interest. Committees are to be appointed in each department to see to the carrying out of this measure according to local circumstances.*

* * *

M. René Binet, the architect, has just completed the first portion of a large addition to the "Magasins de Printemps," built 26 years ago from the designs of the late Paul Sedille, a building which made his reputation at the time. The new portion, when complete, will have a turret at each angle decorated with bas-reliefs, mosaics, and statues, the sculptor being M. Guillot, a pupil of Falguière, and will be crowned by a large dome filled with stained glass.

* * *

The Chamber of Deputies have under consideration a scheme for completing the Conservatoire de Musique in the Rue d'Edinbourg, by the erection of a concert-room to seat 1,200 people, to be carried out under the direction of the architects of the Service des Bâtiments Civils.

* * *

The restoration of the Palace of the Popes, at Avignon, is steadily proceeding, and numerous interesting archæological discoveries are being made during the progress of the work. The apartment called the "Salle des Audiences" is now completely restored, and in the chapel the stained glass which was destroyed during its occupation as a barracks has been replaced according to its original design. The municipality of Avignon are occupied with the restoration of the ancient battlements extending along the bank of the Rhone, between Porte Saint Dominique and Porte de l'Oulle.

*This appears to have been suggested by the English Society for Checking the Abuse of Public Advertising.

In the course of the work carried on under M. Tournaire at the Palais de Justice at Paris, a part of the ancient Gallo-Roman wall of the fourth century has been discovered, at a depth of 10ft. below the present ground level. The "Vieux Paris" Committee are about to undertake further explorations on the spot, in the hope of finding other remains of interest.

* * *

The Société Nationale des Architectes de France holds a general meeting at 15, Rue de la Cerisaie, Paris, to-morrow, at what would be regarded in this country as the unearthly hour of half-past nine in the morning. The programme includes a visit to the Apprentices' School in the Rue des Epinettes. The thirty-eighth congress of French architects takes place this year in Paris, from the 20th to the 25th of June. The opening session will be held at the Ecole des Beaux Arts on the morning of Monday, June 20th, at 10 a.m.

* * *

On the initiative of M. Bergevin, general secretary of the Union Syndicale des Architectes Français, suburban associations or groups of Paris architects are being organised. The Société des Architectes de la Banlieue Est de Paris has been already formed, and its bureau comprises the following names: President, M. G. Damotte (Nogent-sur-Marne); vice-president, M. Wattier (Alfortville); general secretary, M. Léon Travailleur (Montreuil); assistant secretary, M. Trudon (Rosny-sur-Bois); treasurer, M. Carr (Champigny). Northern and southern groups are being formed.

ART NOTES.

The Yerkes Collection. The sale of the Yerkes collection of art treasures, which was begun the week before last comprised two hundred canvases. On the first day forty-three pictures realised £35,000, the highest price being £4,500 for Sir L. Alma-Tadema's "Spring." Only one canvas by an American artist was in the collection—a "Landscape at Sunset," by George Inness—which fetched £1,700. Many of the pictures went for less than Mr. Yerkes had paid for them, notably Meissonnier's "Reconnaissance," which fetched only £1,060 against the £2,700 paid for it in 1891, and a Burne-Jones "Princess Led by a Dragon," bought in 1901 for £1,200, was knocked down for £410.

On the second day, the total proceeds amounted to 769,200 dollars. The highest bid was £25,800, which secured for Messrs. Duveen Brothers what is regarded as the finest example of Turner's genius ever seen in the United States—the "Rockets and Blue Lights." The same painter's "St. Michael's Mount" realised about £5,000. Corot's "Morning" fetched £10,000, and his "Fisherman" £16,100. A Reynolds ("Lady O'Brien") fetched £4,500. The sale in all realised over £450,000.

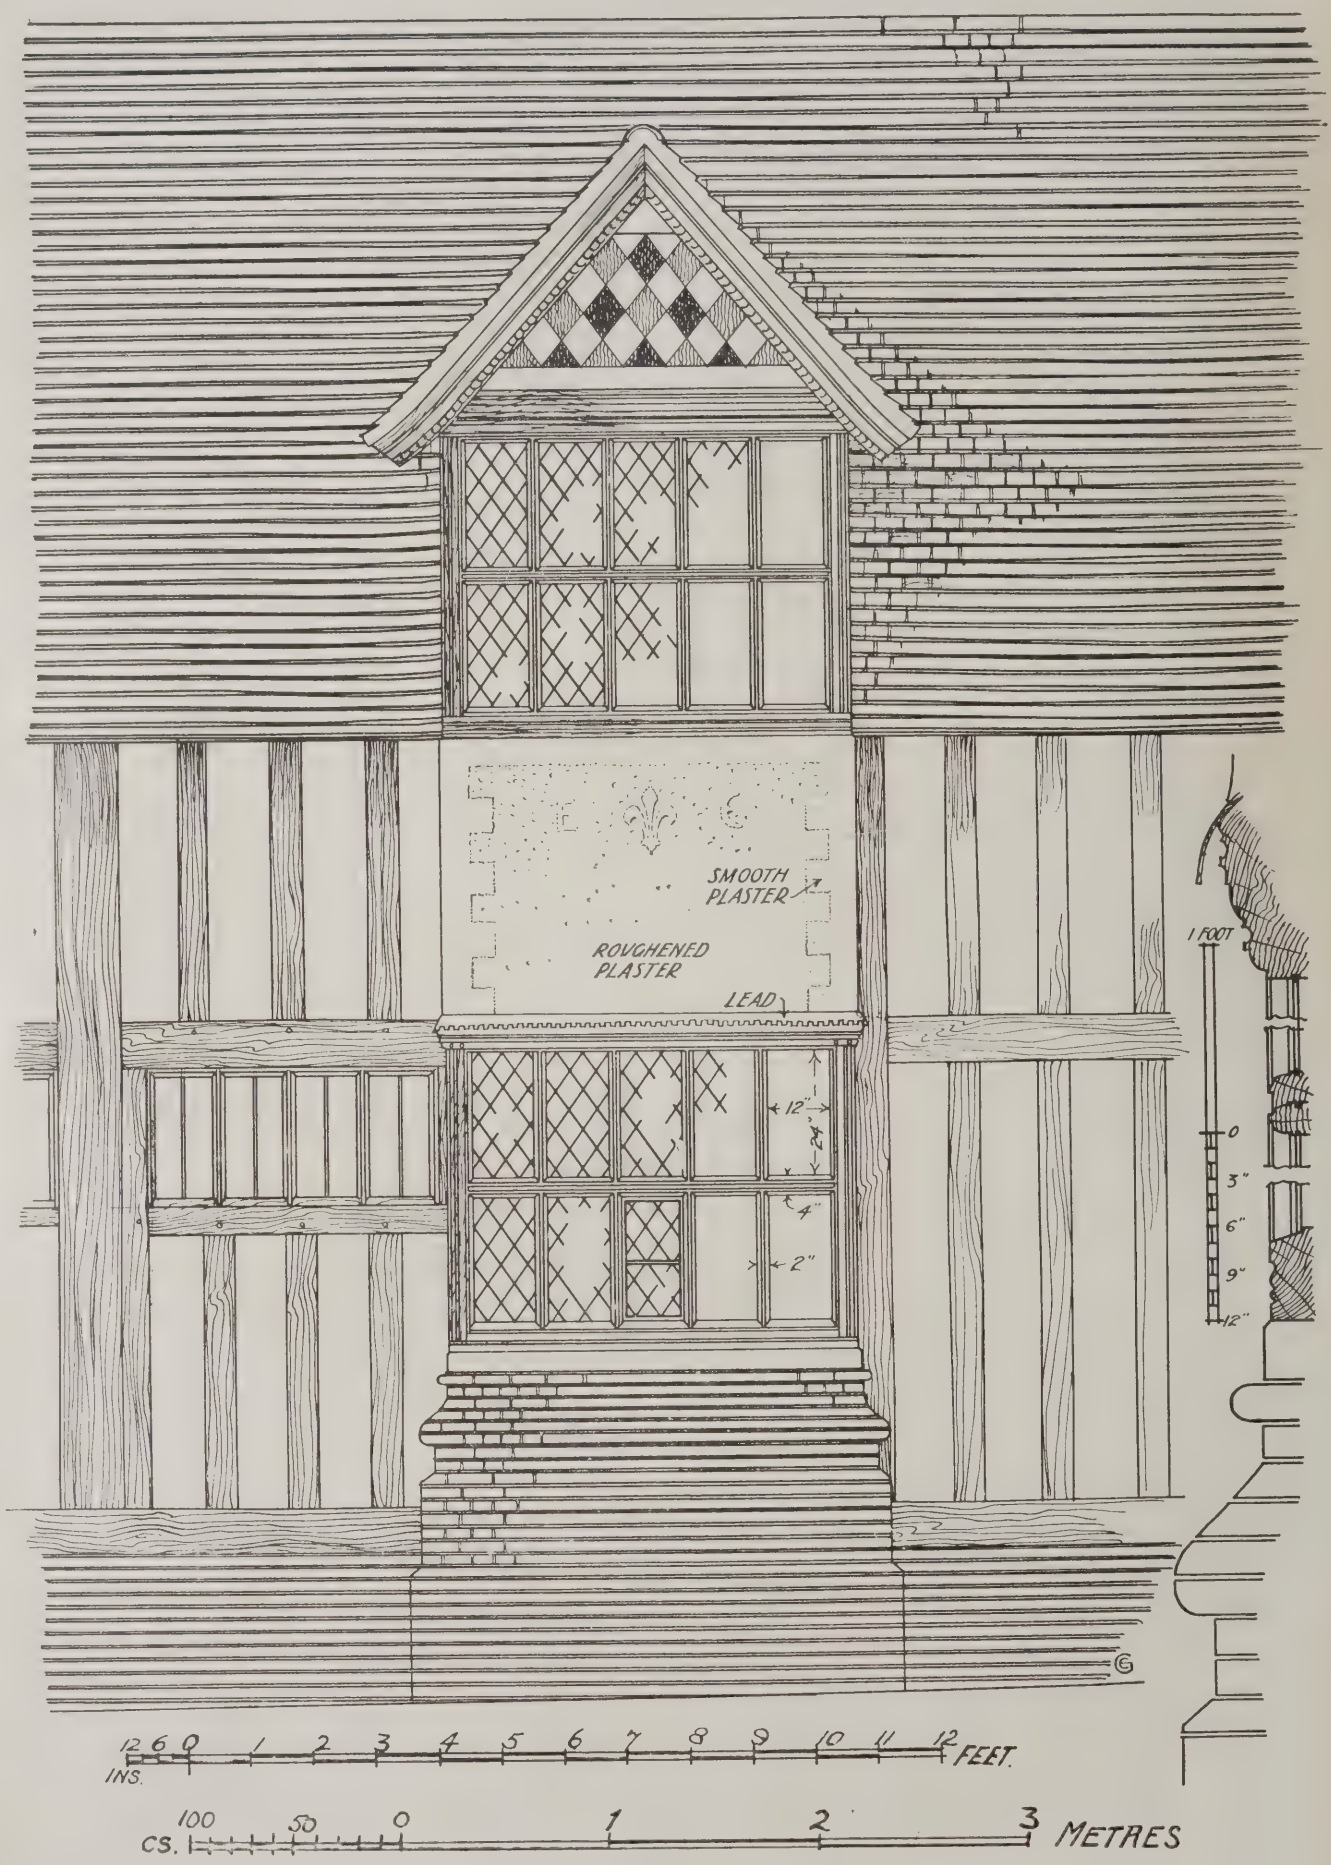
The Rokeby Venus. Mr. James Greig, who some time ago announced in the "Morning Post" his discovery of the signature of Bol on the picture ascribed to Rembrandt in the Winter Exhibition at Burlington House, and who afterwards recorded the finding of the signature of Samuel van Hoogstraeten on an alleged De Hoogh in the Salting Collection, has now announced (in the "Morning Post" of April 5th), "with every sense of responsibility," that on careful examination of the Rokeby Velasquez, which was purchased for £45,000 and presented to the nation, he has found on the low left-hand corner of the painting, about 12ins. under the left foot of the Venus, close to the frame, a signature which suggests to him the initials J.B.D.M., which he takes to be those of Juan Bautista Del Mazo, son-in-law of Velasquez, and his successor as Court Painter to Philip IV. Mazo, it is explained, was a wonderfully expert mimic of the methods of other artists, especially those of Velasquez, and was the real author of the portrait of Admiral Adrian Pulido Pareja, which was bought as a Velasquez for the nation at about £18,000. Mr. Greig, however, is careful to qualify his statement by saying that it is "without prejudice," and he has no doubt that the authorities will have the glass removed so that a careful examination of the picture may be made and a photograph taken of the canvas in which Mr. Greig sees the signature. It strikes us that perhaps it would have been more satisfactory if the statement had been post-

WATER; EARTH; FIRE: MURAL PAINTINGS BY M BONNEFOY ON THE WALLS OF AN INFANTS' SCHOOL, RUE CHARLES BAUDELAIRE, PARIS.

AIR; WIND; THE PLAIN: MURAL PAINTINGS BY M. BONNEFOY ON THE WALLS OF AN INFANTS' SCHOOL, RUE CHARLES BAUDELAIRE, PARIS.

poned pending the exhaustion of all means of verification; and we must also confess to a feeling of dread lest such revelations, whether or not they are fully authentic, may deter the owners of supposed old masters from lending them for exhibition in public. Sir W. B. Richmond, who has for some time held strongly the opinion that the "Venus" is not by Velasquez, whose technique, he declares, "was entirely unlike any shown upon the picture in question," feels sure that the signatures of a different artist are present, but declines at present to commit himself to an opinion as to their identity.

A committee of scrutiny, comprising Messrs. Claude Phillips, Herbert Cook, Lionel Cust, Roger E. Fry, C. J. Holmes, Robert C. Witt, D. S. MacColl, and Sidney Colvin, having minutely examined the picture in the presence of Mr. Greig, report that they have satisfied themselves "that the marks and cracks detected by that gentleman and pointed out to him by us do not show the vestiges of any monogram or signature."



Mr. Charles Sims's Exhibition. Mr. Charles Sims, A.R.A., has now completed the exhibition of paintings in oil and water colour upon which he has been engaged for the last four years, and it was opened at the Leicester Galleries, Leicester Square, on Saturday last, April 16th. Included in the collection will be the finished sketches for his well-known academy pictures, "The Land of Nod," "An Island Festival," and "The Fountain," the latter of which was purchased under the funds of the Chantrey Bequest in 1908, and hangs in the National Gallery of British Art.

"Parking" Wimbledon and Putney Commons. The useful verb "parking," which we understand is already employed in America, may perhaps be used in describing the contemplated extensions of Wimbledon and Putney Commons. The Wimbledon and Putney Commons Extension Fund is being influentially backed, the Lord Mayor of London having promised to preside at a meeting to be held at the Mansion House on April 26th in support of the objects in view, while more than £3,500 has been already subscribed locally. By agreement with the owners of the land which it is sought to acquire successive belts or portions, the council of the fund desire to secure at once an area of about 30 acres when (1) the existing commons would be connected by a broad stretch of greensward and woodland with the Robin Hood Gate of Richmond Park; (2) a strip of finely wooded land more than a mile in length would be secured on the western side of the Beverley Brook (at present only one-half of the stream belongs to the common); while (3) the portion of the stream nearly half a mile in length between the common and Coombe Lane on the south would, for the first time, become accessible to the public, and would give access to the heart of the common for the districts on the south. The price of this mile and a half of wooded stream, and of the open meads connecting the commons with Richmond Park—in all, 29 acres—is £7,370, the average rate per acre being £251, but the purchase must be completed at an early date. All friends of town planning will wish the movement the utmost success.

The Art Journal. The "Art Journal" contains an article by Mr. Dircks on "Mr. Ernest George, A.R.A.," chiefly in regard to his drawings, of which a good many illustrations are given. We quite agree with Mr. Dircks's estimate of them, but a little more about Mr. George's architectural work, which, after all, is his central work, would not have been out of place. The only article touching on the arts connected with architecture is an original one on "Decorative Woodwork." The writer says truly that it would be a great pity if the development of fireproof construction in domestic architecture should lead to the abandonment of woodwork as a decorative feature of the house. There is not really much fear of that, however; in country houses, at all events, fireproof construction need hardly extend beyond the walls, floors, and roofs; in street houses it may be different. Among the illustrations there is an exceedingly simple staircase, praiseworthy for its characteristic treatment of the material, also a hall and staircase by Mr. G. L. Sutcliffe, with simple panelling on the walls, and balusters of the old spiral pattern, which is, after all, one of the most effective that have been invented. A bold piece of ornamental carving and a couple of strapwork panels, by the School of Art Wood Carving, deserve mention. As a whole, however, we do not know that the article helps forward the subject very much.

THE MOUNTAIN; THE RIVER; THE SEA: MURAL PAINTINGS BY M. BONNEFOY ON THE WALLS OF AN INFANTS' SCHOOL, RUE CHARLES BAUDELAIRE, PARIS.

In this drawing some restorations have been attempted, as in the case of the upper window, the original form of which is clearly evidenced. A modern window has been omitted; and the timber, at present roughly patched in cement, has been restored. Kersey was an important centre of the cloth trade during the fifteenth and sixteenth centuries, and the name is familiar in Elizabethan dramatic and other literature.

BAY AND GABLE TO OLD HOUSE, KERSEY, SUFFOLK. DRAWN BY EDWIN GUNN, A.R.I.B.A.

Few finer examples of old half-timbered houses can be found than this one of Kersey. The date of the house is probably fifteenth century, as evidenced by the mouldings of the blocked windows between the bays; but the latter are sixteenth century. One bears a Tudor rose, and the other a *fleur-de-lis* in plaster. The diaper in the gables is in black, white, and buff.

HOUSE, CARLTON HOUSE TERRACE, LONDON.

The interior of this house was entirely demolished and rebuilt; the external walls alone remained to retain the present uniformity of the terrace. The staircase and entrance hall are built of Painswick stone, with floors and staircase of Pentelikon and Irish black marbles. The balustrading to the staircase and galleries is of bronze. On the first floor are two drawing-rooms connected by a saloon from which the ballroom is approached. The second floor contains the private rooms of the family, and the third floor accommodates the household. The offices in the basement are connected with this floor by a lift and a staircase. Messrs. Detmar Blow and Fernand Billerey were the architects. The electrical work was carried out under the direction of Mr. E. Wingfield Bowles, the wiring being executed by Crittall and Co. The bronze balustrading and other work was made by W. Bainbridge Reynolds, Ltd., of Clapham, London. The staircase is lighted with fused silica glass supplied by the Thermal Syndicate, Walls-end-on-Tyne. The general contractors were George Trollope and Sons and Colls and Sons, Ltd., London.

NEW BUILDINGS.

PROPOSED.

Bishop's Stortford.—Sir Walter Gilbey's offer of a site to the Bishop's Stortford Urban Council for the erection of open-air swimming baths for the town, and also to give the Council the control of the sluice on the upper waters of the River Stort, to enable them to regulate the supply of water, has been accepted.

Chorley.—The Highways and Buildings Committee of the Town Council has decided to make application to the Local Government for their sanction to a loan of £4,350 for armouring the main road with granite cubes from the Fish Pond to the northern boundary of the borough. The committee has also approved the following plans:—House in intended street off Bolton Road, wash-houses to two houses in Bolton Road, bath-room and w.c. at Wheat Sheaf Hotel, St. Thomas's Road, two houses in Leigh Row, three houses in Regent Road, addition to house in Railway Road, house in Windsor Road, four houses in Congress Street.

Dundee.—The following plans and sections have been lodged at the office of the City Engineer:—Adelaide Place, addition to villa; Arkley Street, alteration of boiler-house; Duff Street, alteration of cottage; Farrington Street, dwelling-house; Farrington Terrace, cottage; Nelson Street and Wellington Street, temporary building; Paradise Road, addition to dwelling-house; Reform Street, alteration of property; St. Peter Street, stable, etc.; Union Street, alteration of property; Victoria Road, alteration of property; Hilltown, additions to property; Arbroath Road, additions to property; Stirling Road, alteration of property; Forfar Road, addition to villa.

Falmouth.—At a recent meeting of Falmouth Town Council, the General Purposes Committee further reported that they had considered an amended plan of a pavilion at Gyllyngdune at a reduced cost of £1,550, and had resolved that the same be approved, and that the necessary steps be taken for obtaining the Local Government Board's sanction to the borrowing of the amount.

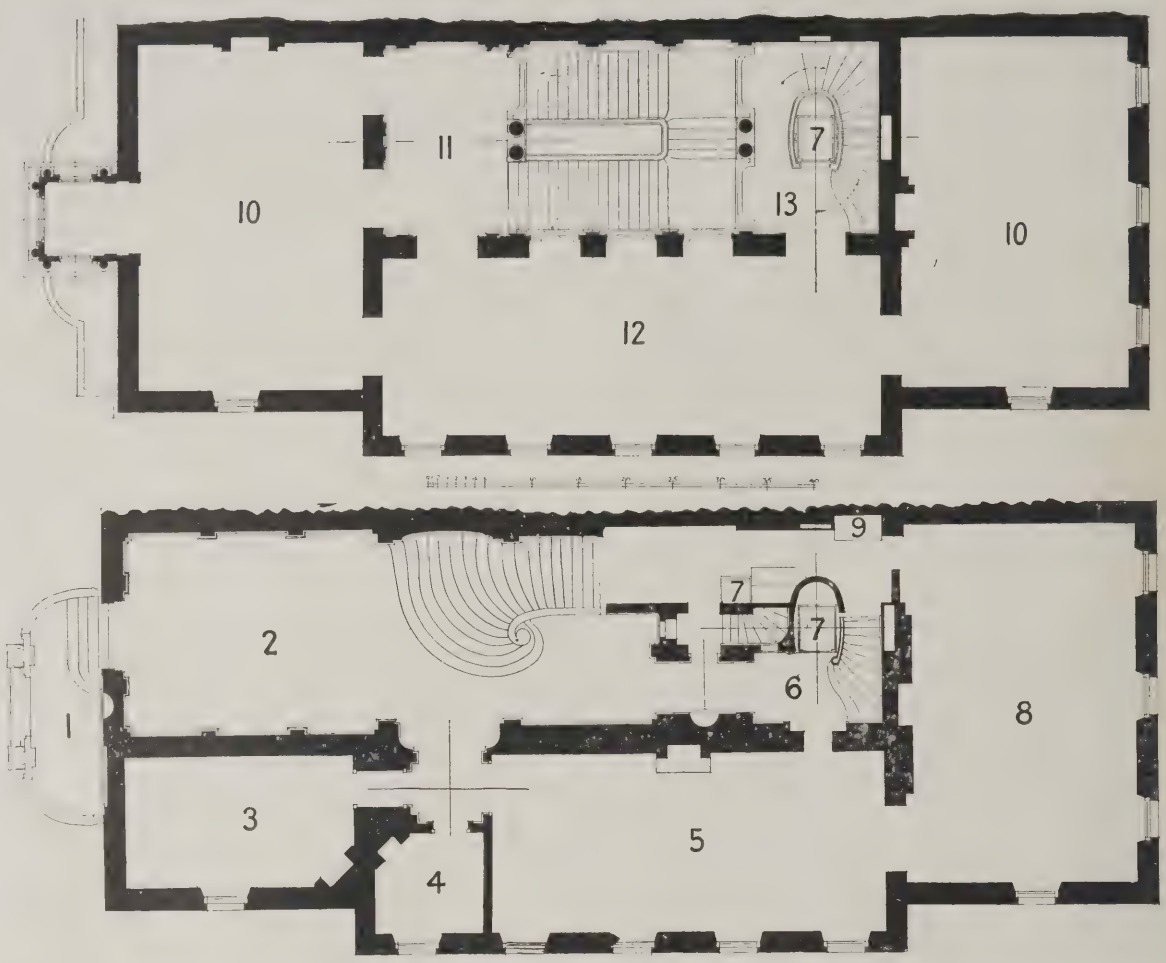
Glasgow.—It is expected that building operations in connection with the new Glasgow music hall—the Alhambra—to be erected on the site of the Waterloo Rooms—will be commenced in a few weeks. The hall will provide seating accommodation on the ground floor and two galleries for about 2,400 people.

Prestwick.—At a recent meeting of Prestwick Town Council it was reported that plans for the proposed kiosk and minstrels' stand on the beach, prepared by Mr. William Cowie, architect, Ayr, had been approved, and to meet the cost the Attractions Committee recommended that the Town Clerk be authorised to borrow £900.

Salford.—The Town Council has agreed to the recommendation of the Buildings and Bridges Committee to accept the tender of Messrs. Heenan and Froude, Limited, to carry out the work of strengthening and repairing the Palatine Bridge, at a cost of £5,642, for which sum borrowing powers have been obtained.

Swansea.—The Harbour Executive Committee, has let to the Welsh Fuel Company, Ltd., a site at the eastern end of the north side of the King's Dock, for a patent fuel works. The committee has also decided to advertise for tenders for a new swing bridge, across the passage connecting the access, to the area reserved for future dock extensions, costing from £6,000 to £8,000.

Saltburn.—The new Primitive Methodist Church has been opened, and will accommodate 500 worshippers. The cost of the church and schools was £5,200, and the style of architecture is of Late Gothic in red brick with terra cotta dressings. Electric light is installed, and the ventilation and heating are on the latest principles. The school comprises a large central hall with eight classrooms.



Southend.—The Town Council have passed the following plans:—Two houses in Leigh Road East; seven houses, Central Avenue; two houses, Belle Vue Road; twelve houses, Moseley Street; three houses, Southview Drive; two houses, Brightwell Avenue, 17 houses, Hainault Avenue; three houses, Electric Avenue; 20 lock-up shops, Eastern Esplanade, and an entertainment hall, Royal Hill; Welcome Club, Station Road; five houses, Brightwell Avenue; two houses, Gloucester Terrace; six houses and shops, Leigh Road West; flats, Whitefriars Crescent; two houses, St. Ann's Road; one house, Sea View Road; two houses, Hildaville Drive; two houses and shops, Station Road, and house and shop, near Whitefriars Crescent; a house, Cliff Gardens.

Photo: E. Dockree.

The staircase and hall are built of Painswick stone, with floors and steps of Pentelikon and black marble.

New Buildings Continued.

IN PROGRESS AND COMPLETED.

Balby.—It has been decided to proceed immediately with the enlargement of the Balby Church at a cost of fully £2,000, which will include the erection of a new east end, and the present seating accommodation will be doubled.

Barry Dock.—The foundation-stones of the new Wesleyan Methodist Chuch, which is in course of erection in Halton Road, were recently laid, and the building, when completed, will accommodate 650 persons, while beneath there will be a hall capable of seating several hundred. The contractors are Messrs. Lloyd and Tape, Barry Dock, and the architect Mr. Henry Budgen, Cardiff.

Blackpool.—The Corporation has approved the following plans:—New street, Preston Old Road; three houses, Preston Old Road; 13 houses, Hawthorn Road; house, Little Layton; house, Highbury Avenue; house, Norwood Avenue; houses, Norbury Avenue; houses, Lincoln Road; 2 houses, Holmfield Road and Warbreck Drive and Mere Road; 2 houses, Halifax Street; 2 houses and store room, Rothesay pump room and stores, New Road; alterations, Whinney Heys Hall; alterations, Metropole Hotel; alterations and additions, Central Beach; additions, Gorton Street; additions, Beech Avenue and Brian Road; bay windows, wash-house, etc., Preston Road; extensions, Kent Road; alterations, Brighton Hydro; additions, Clifton Street; alterations, Central Drive; shed, Gloucester Avenue; additions, Mere Road; alterations, Derby Road; alterations, Raikes Road; greenhouse, Caunce Street; additions, Victoria Hall, Waterloo Road; alterations, Bolton Street, Manchester; additions, Ribble Road, Tadcaster Brewery; verandah, Carshalton Road and Boothrodon.

Fenton.—The new school, designed by Mr. S. B. Ashworth, architect to the Education Committee, has been completed at a cost of £3,400. The general contractors were Messrs. Ball and Robinson, of Stoke-on-Trent, and the principal sub-contractors were: Minton, Hollins and Co., glazed tiles; Homan and Rodgers, fireproof floors, etc.; J. Gibbons, Wolverhampton, steel casements, gas and cloak-room fittings; and Mellows, Sheffield, roof glazing. The school will accommodate 380 children.

Gretna.—The old Parish Church, which has been undergoing extensive alterations, including addition of a bell tower, an aisle and short transept, and the filling of the four pointed front windows with plain geometrical stone tracery, has been completed, at a cost of £1,500. Mr. Barbour, of Dumfries, was the architect.

Huntly.—The Dean of Guild Court has approved the plans of extensive additions to the hosiery factory of Messrs. W. Spence and Son, Gordon Street, and two new dwellings, Littlejohn Street.

Leyland.—The Urban District Council has approved a plan for seven cottages in Spring Street, subject to the requirements of the surveyor being complied with.

Llanelly.—Messrs. Richard Thomas and Co. (Limited), tin-plate manufacturers, have just started the building of a new tin-plate works at Llanelly. The site of the new works is adjoining the South Wales Works, and it will be built on the most modern lines.

Northampton.—The new parochial building adjoining St. Lawrence Church have been opened on completion. The work has been executed at a cost of upwards of £2,000 by Messrs. E. D. Sharman and Son, builders, Northampton, from the designs of Messrs. M. H. Holding, A.R.I.B.A., and Edward de W. Holding, of the Corn Exchange, Northampton.

Oban.—The new post office, erected on ground adjoining the municipal offices, has been completed, and has a frontage of 82ft. to both Albany and Shore Streets. The whole building is constructed on fire-resisting and hygienic principles. The elevations to Albany Street, which are designed in the style of later Scottish baronial, are faced with granite rubble from Balachulish quarries, with Giffnock sandstone dressings. The cost of the buildings was over £9,000. The architect is Mr. W. T. Oldrieve, F.R.I.B.A., H.M., Principal Architect for Scotland.

Peckham.—The re-building of St. Mary Magdalene Church has been commenced owing to the risk of injury incurred by the worshippers. A surveyor reported that the east end was liable to collapse, and that the whole edifice was in an extremely unsafe condition. A contract has been signed for £2,600.

Marsden.—A scheme begun in 1892 at St. Bartholemew's Parish Church, is now about to be completed by the erection of a tower 100ft. in height, at the west end of the nave, involving an expenditure of £3,800.

Southampton. — The Polygon Baptist Church and Schools, of which the foundation-stone was recently laid, will be faced with red bricks with Bath stone dressings, and the complete scheme embraces church with tower, and schools, a portion of which are to be omitted for the present. The contract for the present portion amounts to £5,795, and is let to Mr. J. Nichol, of Bitterne Park, Southampton. The architects are Messrs. George Baines and Son, 5, Clements Inn, Strand, W.C., whose designs were selected in a recent competition.

hoto : Bedford Lemere ana Co.

HOUSE, CARLTON HOUSE TERRACE, LONDON: THE SALON DETMAR BLOW AND FERNAND BILLEREY, ARCHITECTS

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

Southgate.—The Urban District Council has approved the following plans:—Extension at the rear of No. 8, The Market, Green Lanes, Palmers Green; 8 stables and coach-houses at the rear of Nos. 14a to 19, The Promenade, Palmers Green; 2 dwelling-houses in Conway Road, Southgate; 10 dwelling-houses in Greenwood Gardens, Palmers Green; 3 dwelling-houses in Broomfield Lane, Palmers Green; 7 dwelling-houses in Burford Gardens, Palmers Green; 5 dwelling-houses in Fernleigh Road, Winchmore Hill.

Sutton-on-Sea.—The new Wesleyan Church and Schoolroom have been opened on completion at a cost of £4,200, the architects being Messrs. John Wills and Son, Derby and London, and the contractors Messrs. D. Panks and Son, Grantham.

Uxbridge.—The Streets and Works Committee of the Urban District Council has approved the following plans:—Additions at rear of No. 4, Vine Street; pair of houses, Chiltern View Road.

Wanstead.—The foundation-stone of the new West Ham Union Receiving Homes, situate in Aldersbrook Road, has been laid, and the building when completed will consist of three blocks with accommodation for 250 children. The builder is Mr. F. J. Coxhead, Leytonstone, whose price is £20,493, and the architects are Messrs. William and John Jacques, 2, Fen Court, E.C.

York.—The Streets and Buildings Committee of the Corporation has approved the following plans:—Rebuilding staircase wing, 38, Stonegate; 10 cottages, Moorgate; temporary store, Prospect Terrace, Bishophill; Promenade Road Club, w.c. and re-drainage, Promenade Road; 4 houses, Grosmont Terrace; 2 cottages, Howe Hill Road; 2 houses, Lime Avenue, Stockton Lane; St. Peter's School, w.c.'s and urinals, Clifton Garth, Clifton; new factory, Haxby Road; combined drainage, Faber Street.

Ynysybwl.—The erection of Christ Church Parish Hall at a cost of £1,150 is in progress, and the foundation-stones were recently laid. Messrs. T. E. Richards and Kaye, Pontypridd, are the architects, and Messrs. Williams Bros., Ynysybwl, the contractors.

FOREIGN NOTES.

New Law Courts for St. Petersburg.

The Russian Ministry of Justice has decided to erect new law courts for St. Petersburg at a cost of £250,000, exclusive of the land, which the municipality is asked to provide free or on easy terms of payment.

Harbour Works at Venice.

The accommodation at the maritime station at Venice is shortly to be extended at an estimated cost of £240,000, and arrangements have been made for the execution of the work by Signor Edoardo Almagià. The extensions include a dock parallel to the existing one, the opening of subsidiary canals, the construction of embankments, quays, and walls, and other accessory work, the whole to be completed within 52 months. The main navigation canal leading to the large basin to be built at the Bottenighi, near Mestre, is then to be excavated to a depth of 10 metres. The basin itself will be 1,000 metres long, 200 metres wide, and 10 metres deep, and the quays will be provided with cranes, stores, and other necessary equipment.

Italian Builders' Huge Strike.

Thirty-five thousand workmen at Milan have been thrown out of work as the result of a proclamation of a general strike in the building and allied trades. All work of this kind is at a standstill not only in the city but within a five-mile radius of Milan. A similar strike is fast extending over the entire province of Piacenza. The situation is regarded as very serious, because, apart from the failure of the local prefects in their efforts to promote an understanding, there is the coincidence of a great building strike in Germany, which involves another 100,000 Italian hands, and precludes the possibility of an interchange between the two countries.

Labour Troubles in Germany.

The "Tageblatt" stated that the Government had decided to offer its mediation with a view to prevent the imminent general strike in the building trades. A conference of representatives of the masters and men was subsequently held at the Imperial Ministry of the Interior. Individual firms are also making energetic efforts to effect a reconciliation at the eleventh hour, and the tone of the Press became more hopeful than it was when reporting, a day or two before, that delegates representing about 300,000 of the masons and joiners of Germany had been holding sittings at Berlin in order to determine what attitude they should adopt towards the conditions which have been laid down by the Employers' League for the German building trade. If the negotiations fail, a general strike will begin on April 23rd. The agreement between employers and employed, which was drawn up in 1908, expired on April 1st for all branches of the building and allied trades. The Employers' League resolved a fortnight before upon a new form of agreement, acceptance of which they now demand. The main points are that in future all agreements shall be concluded between the central bodies of employers and the workmen's organisations respectively, that the system of piecework shall be definitely recognised, that labour exchanges organised by employers alone shall be secured from interference by workmen's organisations, and that the whole agreement shall hold good for three years. The attitude of the workmen's organisations towards these proposals is distinctly hostile. The employers, backed by bankers and other opponents of socialism, are determined to crush trades-unionism.

Dwellings and Workshops in Vienna.

At last Vienna has set about the task of improving the housing of the working-classes, and not only the housing but the workshop condition of the workers. In the Margarethen suburb an imposing square block of workshops and living-rooms has been erected, and at a rentage below that usually charged for damp, dark, and unhealthy quarters. This seven-storeyed building contains 150 separate workshops, and some forty model dwellings, and is but the first instalment of the new improvement scheme.

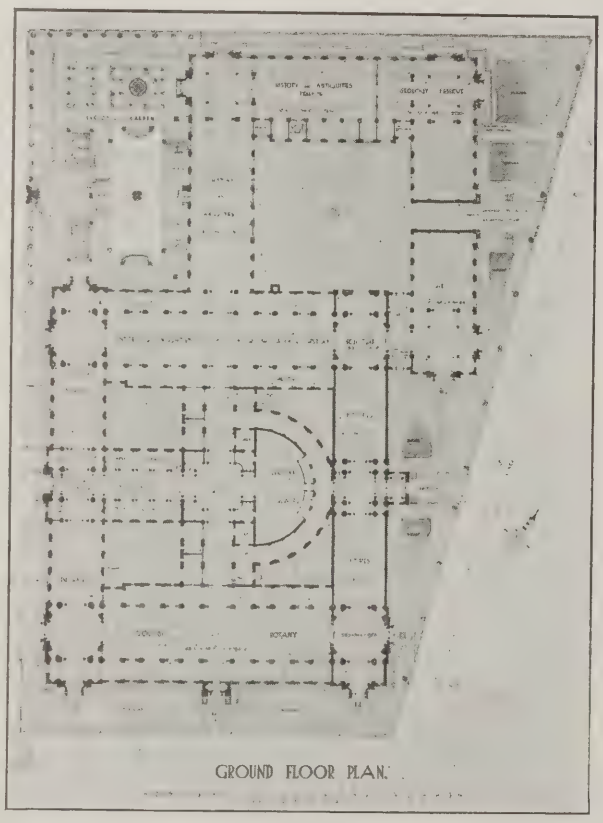

Photo: E. Dockree.

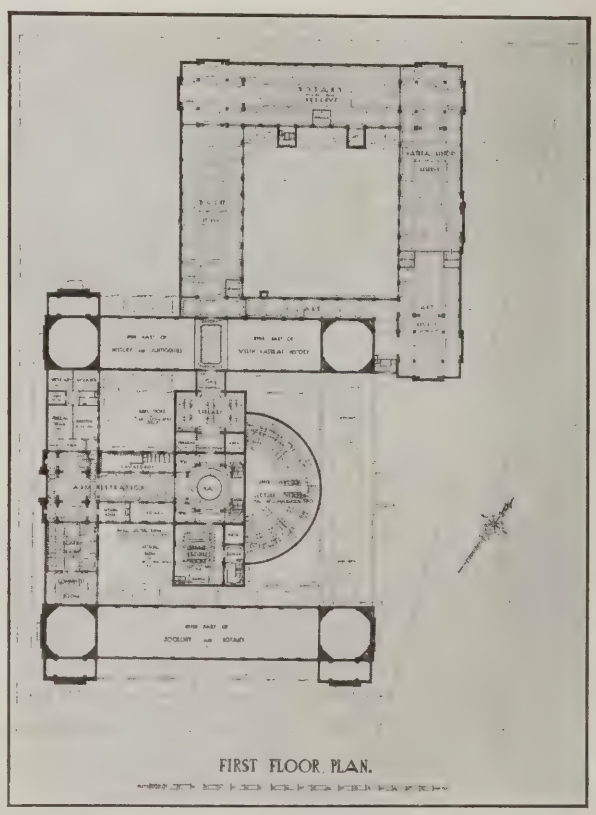

The walls are of Painswick stone, the steps of black marble. The balustrading (only partly fixed as shown here) is in bronze.

CORRESPONDENCE.

[The Editor declines responsibility for the statements made or opinions expressed by correspondents.]

Licentiates R.I.B.A.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—May I venture to commend to the careful consideration of all architects (whether principals or assistants) who are not members of the R.I.B.A., the advisability of taking the present opportunity of becoming Licentiates of the central representative body. The title of Licentiate is conferred by Royal Charter; as a title it has its parallel in the L.R.C.P. of the medical profession, and the power for Licentiates to become Fellows, should they so desire, is secured by the Charter. There are already several hundreds of applicants, and it is hoped that every bona-fide architect will be enrolled. The next step will be the consideration by the general body of the Bill now being drafted to secure statutory recognition.

EDWIN T. HALL.

London, W.C.

NOTES ON COMPETITIONS.

New School, Dumbarton.

The report of Mr. Samuel Preston, Master of Works, Govan School Board, assessor, on the plans submitted for the proposed new school at Braehead, Dumbarton, has been considered by the Dumbarton School Board. Mr. Preston has selected the design of Mr. John Rogerson, Dumbarton, and the Board has appointed Mr. Rogerson as architect, subject to some modifications to reduce the cost.

Church Schools, Bromley, Kent.

The award of the assessor, Mr. H. P. Burke Downing, F.R.I.B.A., of Westminster, in the limited competition for Church Schools at Masons' Hill, Bromley, was submitted at the last meeting of the trustees and managers and unanimously adopted. In his report Mr. Burke Downing says:—

"I award the first place to the design marked 'D.' The main building is well situated on the site and the entrances and exits are well placed. The scheme is an economical one, and the plan solves the problem of arrangement of the classrooms and halls in a very workable manner, and one most helpful to good school administration. The design is very happy in its suitability to the character and purpose of the building. The estimate of £4,930, based on a foot cube rate of 7d., is, in my opinion, a fair one, and it should be practicable to erect the building at that cost."

When the sealed envelopes containing the names and addresses of the competitors were opened, it was found that the author of the design placed first was Mr. C. H. B. Quennell, F.R.I.B.A., and he was appointed architect for the erection of the schools. On the recommendation of the assessor an honorarium of 20 guineas was assigned to the authors of the design marked "A," Messrs. Russell and Cooper, FF.R.I.B.A. To each of the remaining competitors an honorarium of 10 guineas will be paid. The drawings are hung in the Art School, Bromley.

LIST OF COMPETITIONS OPEN.

APRIL 23. COUNTY OFFICES, NAVAN. Particulars given in our issue of March 16th.

MAY 2. STOCKPORT NEW LIBRARY. Architects desirous of competing for the designs of the library which the corporation propose to erect are invited to send their names, with information as to their experience in and qualifications for carrying out such work, to the undersigned on or before Monday, May 2nd, 1910. From the names sent in the corporation propose to select a number to compete for the work. Canvassing will be regarded as a disqualification. Robert Hyde, Town Clerk, Town Hall, Stockport.

MAY 31. MUNICIPAL OFFICES, KARACHI. Particulars given in our issue March 16th.

JUNE 11. COVENTRY. ENLARGEMENT OF SCHOOL at STOKE. Limited to Architects practising in Coventry. Particulars given in our issue of March 16th.

JUNE 15. ELEMENTARY SCHOOLS, ACTON. Particulars given in our issue of March 16th. The Royal Institute of British Architects has requested architects not to compete.

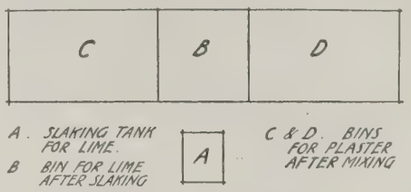
AUGUST 31. COVENTRY. NEW ELEMENTARY SCHOOL in Centaur Road. Limited to Architects practising in Coventry. Particulars given in our issue of March 16th.

NO DATE. PROPOSED USHER HALL, EDINBURGH. The Corporation of the City of Edinburgh desire to receive competition designs for the erection of a new hall in Lothian Road, Edinburgh. They have appointed Sir Aston Webb, C.B., R.A., London, as assessor, Mr. J. A. Williamson, A.R.I.B.A., City Chambers, being associated with him. Three premiums are offered. Particulars and plans of the site will be supplied to competitors on payment of a fee of two guineas, which will be returned on receipt of a design in accordance with the conditions. Should architects on receipt of the particulars not desire to compete, the deposit will be returned, provided the papers are returned within four weeks. Inquiries to be addressed to Thomas Hunter, Town Clerk, City Chambers, Edinburgh.

PRACTICAL NOTES.

Defects in Plastering.

Such frequent trouble is now experienced by architects and builders in connection with plastering on walls and ceilings that it is perhaps a question whether more attention may not deservingly be bestowed on this rather subsidiary but none the less very evident item in a building's visible factors, in order to ascertain the probable causes and possible remedies for such oft-recurring defects.



The failures may be attributed to two main sources—(a) careless workmanship, (b) unsuitable material.

(a) Perhaps the most common of all defects comes under the former head, viz., the crazing of surfaces with a network of fine hair cracks, quite distinct from the occasional more serious cracks and blisters caused by the blowing particles of unslaked lime. This defect is probably as largely due to scanty application of "elbow grease" as to any other cause, though it is aided by too rapid absorption of moisture by dry undercoats.

The remedy is the proper moistening of the surface of each coat of plaster before the next coat is applied, and insistence on the floating being consolidated by well scouring with a hand float, and plenty of "elbow grease" after the stuff has been laid.

This scouring should be done after the coarse stuff has stood long enough to permit of shrinkage, and of the formation of a firm surface, but not so long as to allow it to become dry. The plasterer holds the float in one hand and a stock brush in the other, with which he sprinkles water on the surface, vigorously working the float with a rapid circular motion meanwhile. Any slight inequalities left from the floating rule can be filled in with a little soft stuff. The success of the work is wholly dependent on the workman performing this work evenly, neither missing any part nor scouring one part more than another. All floating should be scoured twice, with an interval of between three and five hours between the operations, and first-class work should be finally scoured again after a further interval of one day, the scouring being continued until little or no moisture is left on the surface. This of course leaves a close grained and somewhat smooth surface, offering little adhesion to the setting coat, and if setting is intended, it should be keyed or roughened as soon as finished. Many architects now, however, apply Duresco or other washable distemper direct on a floated surface, the result giving an agreeable texture in the finished work.

Ordinary "coarse stuff," composed of lime, sand, and hair, is commonly mixed upon large building works in the following manner:—Bins are constructed as shown.

The lime is slaked in tank A, then run through a fine sieve into bin B. When the lime has sufficiently cooled, the hair is added and well mixed in with a hair hook, which distributes the hair in the lime. When thoroughly mixed the sand is added and again larried with the hair hook. The mixed coarse stuff is left for a time, to allow surplus water to drain off, and when sufficiently consolidated it is turned out into bins C and D, and again larried to obtain thorough mixing.

The quantities dealt with at each mixing of a 2 to 1 plaster would be about 4 cube yards unslaked lime, 8 cube yards sand, and one hundredweight bag of hair. The proportions of the various materials are ordinarily specified by architects with considerable care, but an important detail frequently omitted or left to the doubtful initiative of the workmen, is the stage in the operations at which the hair is to be added. It should not be mixed with the plaster until immediately before application, as if left too long in contact with hot lime, the quality of the hair may be entirely destroyed—losing all tenacity and becoming brittle and thin.

An examination of mixed "coarse stuff" immediately before application should always be made, and will frequently disclose the hair to be in this condition, which may be from the above cause, or (b) the use of hair from an American tannery. A common form of specification reads, "fresh bullocks' hair well beaten free from dust, but on no account to be washed or wetted before using."

In the case of hair removed from the hides after treatment of the latter with lime, as practised in old-fashioned bark tanneries, this stipulation was probably quite right. Now that chemical processes have almost entirely supplanted this old-time treatment (surphuric aid being one of the chemicals employed), it is a question whether washing should not be specified as likely to do less harm than good, though it may be doubtful whether hair once acted upon by destructive chemical solutions will ever be entirely freed or retain its toughness. It is probably now wiser to omit hair altogether from the plaster, substituting manila, jute, or cocoanut fibre. The latter is already largely used by manufacturers of slab plaster, and appears to give satisfactory results.

The use of unsuitable sand is another frequent cause of the failure of plastering, which in the case of ceilings often becomes sufficiently friable to fall within a very short period of its execution.

Admittedly inferior sands of a loamy nature are of course mistrusted and frequently rejected in good class work, but a certain type of clean ferruginous sand making very excellent cement mortar for ordinary building work, and on that account often preferred, may also be very dangerous for use in plastering. It is well known that common lime plastering is a very porous material, and readily absorbs a considerable amount of moisture from the atmosphere. It may be conjectured that oxidation and swelling of the ferruginous particles takes place from this cause, destroying the cohesion of the plaster with the result before mentioned.

SOCIETIES' REPORTS.

R.I.B.A.

The following gentlemen have been nominated for election at the meeting on June 6th, 1910:—*As Fellows*: E. R. Barrow, London; A. W. Cooksey, London; W. D. Dawson, London; H. Gilbert, London. *As Associates*: G. L. Alexander, London; W. J. Beall, Pietermaritzburg; N. W. Hadwen, Triangle (Yorks), J. F. Munnings, India; D. J. Roberts, Erdington, Birmingham; H. Sutcliffe, Melbourne, Australia; E. A. Taylor, Sydney, N.S.W.; M. Thompson, Doncaster.

The Concrete Institute.

The deputation of members of the Concrete Institute have returned from Paris, where they have been making a special enquiry into the durability of reinforced concrete. For this purpose, visits were paid to about a dozen important structures in and near Paris, including bridges, culverts, tunnels, reservoirs, and buildings, all of reinforced concrete. These were of various ages, the oldest being the roof of a large house constructed no less than 58 years ago by the late M. Coignet, whom many consider to have been the first inventor of this material. The programme of visits was arranged by Professor Rabut, the Chief Engineer for New Works of the French State Railways. The deputation were specially invited to dine with the "Association des ingénieurs des Ponts et Chaussées." In the absence of the president, the visitors were received by M. Colson, Membre de Conseil de l'Etat, a former Inspector-General of this distinguished Corps. The visitors were also hospitably entertained by the "Chambre Syndicale des Constructeurs en Ciment armé," whose president, M. Edmond Coignet, is a son of the famous inventor, and by M. Hennebique, whose reputation as a designer of reinforced concrete is world-wide. The deputation consisted of:—Sir Henry Tanner, K.S.O., F.R.I.B.A., Mr. William Dunn, F.R.I.B.A., Mr. F. A. White, Mr. A. Ross, M.Inst.C.E., Mr. C. H. Colson, M.Inst.C.E., Mr. W. G. Kirkaldy, A.M.Inst.C.E., Mr. J. S. E. de Vesian, M.Inst.C.E., Mr. F. E. Wentworth-Sheilds, M.Inst. C.E., Mr. E. P. Wells, J.P., Mr. H. K. Dyson, Mr. H. K. G. Bamber, A.M.Inst.C.E., F.C.S., Capt. Gibson-Fleming R.E., Mr. G. C. Workman, Mr. P. W. Leslie, Mr. H. Anderson, and Mr. P. M. Fraser, A.M.Inst.C.E. It is understood that the deputation were well satisfied with the results of their inspection which will form the subject of a special report.

TRADE AND CRAFT.

Barrel Locks and Latches.

We have received for examination a sample of Stevens's patent barrel locks and latches, which have been devised upon a new principle as regards the mechanism. The chief advantages which the new lock affords are that the comparatively small tube can be fixed in a boring made with a 1in. centre-bit, thus saving very considerably on the labour of mortising, while it does not weaken the door to the extent inevitable under the old system; and that there are no delicate parts in the mechanism, in which a strong spiral spring offers a satisfactory guarantee of long life and efficiency—a most important point for the tenant, who knows that the spring of the ordinary mortice lock is a chronic nuisance. It is evident that the Stevens' lock, owing to the strength and simplicity of its mechanism, will stand any amount of hard wear, and thus not only overcomes the domestic worry consequent on the liability of the spring to get out of order, but is peculiarly adapted for use in public buildings or other places where the doors are in constant use. The lock is made by Messrs. Simkins and Hadley, of Baltic Works, Willenhall, Staffs, and can be had of all builders' merchants.

A Self-acting Room Ventilator.

To obtain ventilation without draught is to achieve health and comfort combined, and in the matter of ventilation, it is rather difficult to conceive that the draught which gives rise to discomfort is in any way healthy; the very feeling of discomfort being, in fact, in the nature of a warning of impending danger. Yet it is not easy to secure a regular supply of fresh air, nor even to provide for the escape of vitiated air, without, in the same action, setting up a draught, which may possibly do at least as much harm as good. Mr. E. G. Wright, of Guildford, is the inventor of cowl ventilators and appliances for the prevention of down-draught, and has now turned his attention to the ventilation of rooms by means of a modification of the principle which he has successfully employed in his cowls. The device is at once quite simple and very ingenious. The object is to prevent back draught. Obviously, a plain grating, or a simple air brick, in a wall is rather apt to become a pronounced nuisance when it happens that the wind blows directly against it. Either the vitiated air is denied egress, or is blown back by an uncomfortable inrush of air of lower temperature. Mr. Wright's self-acting room ventilator has been designed to overcome this difficulty. It consists of an oblong metal box, of about the length and breadth of an ordinary brick, open at the ends, and provided internally with an arrangement of plates set at angles which have been nicely adjusted so as to receive and carry across the outer air, no matter how strong the wind, which, in fact, instead of opposing the egress of air from the room, actually assists in extracting and carrying it away; and any fresh air that can find its way into the room does not arrive in gusts, but flows in gently and imperceptibly. It is suitable for many services, and apparently has a particular application to geysers, for which the inventor provides a special form of adjustment, by means of which the noxious fumes are conducted to the outer air, rendering the use of the geyser safe and convenient.

Imitation Marbles.

For the decoration of hotels, theatres, and business and other premises where considerations of cost rule out real marble, excellent effects, otherwise unattainable, are secured by the use of the close imitations which are now possible. Among these the Fassio marble is strikingly successful in its close resemblance in colour, figure, and finish to the actual article. It is manufactured from non-inflammable material, in ¼in. thickness, and is supplied from a large range of stock patterns, in slabs, 3ft. by 2ft., and 2ft. by 1ft. thick, for wall lining. It is also made in various thicknesses as required for various other purposes. It is easily and quickly fixed, does not craze, and is not only decorative, but sanitary. Samples may be seen at the offices of Fassio Marble (1909), Ltd., 59 and 60, Chancery Lane, London., W.C.

TRADE NEWS.

We regret to hear of the death, on Sunday, April 10th, of Mr. George Henry Johnson, at his house, "Bryncliffe," Bennetts Hill, Oxted, Birkenhead. Mr. Johnson was formerly in partnership with Mr. J. B. Johnson, of Crown Street, Liverpool, for seven years, from 1890 to 1897, and latterly with his brother, Mr. Ben H. Johnson, trading as Henry Johnson and Sons, from 1897 to March 5th, 1910. This partnership was only just dissolved when Mr. Johnson was taken ill and died from pneumonia. As a member of the firm of Henry Johnson and Sons, he was associated with some of the most important work in England; especially may be mentioned that in connection with the Cotton Exchange, Liverpool; Selfridge's Store, London, and Lancaster Town Hall.

We are asked to announce that Mr. T. Percival Chubb, of Bowley Street, London, E., has been appointed by the (U.K.) "Winget" Concrete Machine Co., Ltd., of Newcastle-on-Tyne, as their sole agent for London and the home counties, for the sale of their well-known "Winget" concrete block-making machines and "Express" concrete mixers.

We are advised that Mr. J. J. S. Davidson has resigned the managing directorship of the British Uralite Company, Ltd., of London and Higham, as, owing to his other engagements, he is unable to give the close personal attention that the interests of the company demand. Mr. Davidson is not severing his connection with the company entirely, as he will continue to act as director. Under his management the company has been put on a sound financial basis; the factory has been reorganised, new markets have been developed for Uralite at payable prices, and the manufacture of Asbestone has been initiated to compete with the cheap Continental materials. We are informed that Mr. Davidson has prepared a scheme for a new power system, and that when this is carried into effect, the company may confidently look forward to a period of continued and expanding prosperity.

COMING EVENTS.

Wednesday, April 20.

ROYAL SANITARY INSTITUTE.—Sir John A. Cockburn, K.C.M.G., on "The Public Health Aspect of Food Supply in the Colonies," 5.15 p.m.

Thursday, April 21.

R.I.B.A.—Literature Committee meets.

ROYAL SOCIETY OF ARTS (Indian Section).—Mr. J. Claude White on "The Arts and Crafts of Tibet and the Eastern Himalayas," 4.30 p.m.

Saturday, April 23.

R.I.B.A.—Council's Annual Report issued.

Monday, April 25.

ROYAL SOCIETY OF ARTS.—(Cantor Lecture). Mr. A. B. Searle's Third Lecture on "Modern Methods of Brickmaking," 8 p.m.

Friday, April 29.

ARCHITECTURAL ASSOCIATION.—Mr. Mowbray A. Green on "The Architecture of Bath." Election of officers. 7.30 p.m.

Monday, May 2.

R.I.B.A.—Annual general meeting.

ROYAL SOCIETY OF ARTS (Cantor Lecture).—Mr. A. B. Searle on 4th and concluding lecture on "Modern Methods of Brick-making," 8 p.m.

Wednesday, May 4.

R.I B.A.—Art Committee meets.

Thursday, May 5.

ARCHITECTURAL ASSOCIATION.—Members' dinner.

Friday, May 6.

ARCHITECTURAL ASSOCIATION DEBATING SOCIETY, 7 p.m.

Saturday, May 7.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Visit to Newliston.

R.I.B.A.—Issue of voting papers; election of Council and Standing Committees; publication candidates for membership, June 6th election.

MUNICIPAL AND HEALTH EXHIBITION.—Royal Agricultural Hall, London; opens and continues to May 14th.

Tuesday, May 10.

R.I.B.A.—Practice Committee meets.

Thursday, May 12.

R.I.B.A.—Science Committee meets.

Friday, May 13.

R.I.B.A.—Last day for receiving applications and testimonies of study for June final examination and probationary work for special examination.

Saturday, May 14.

MUNICIPAL AND HEALTH EXHIBITION.—Royal Agricultural Hall, London, closes.

Monday, May 16.

Whit-Monday.—Bank Holiday.

Thursday, May 19.

R.I.B.A.—Literature Committee meets.

Saturday, May 21.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Visit to Broomhall, Fife.

R.I.B.A.—Last day for receiving notices of questions for discussion at meeting on June 6th.

LONDON SUBURBS.

WIMBLEDON

Wimbledon, situated about 7½ miles to the south-west of London, is to-day one of its most populous suburbs. Within recent years it has grown from an obscure urban district to an expanding borough, having a population of more than 52,000.

Haphazard Growth.

Wimbledon would serve pretty well for a "striking example" of the need for systematic centrally controlled town-planning. Its principal street is not a main thoroughfare, but merely a branch road, which, after climbing a steep hill, loses itself on the common. The rapid growth from village to town is traceable to three main causes:—(1) The rifle competitions formerly held here, which made the place notorious; (2) the now fast waning natural beauties of the place; and (3) the extraordinary railway facilities (the town is served by three companies).

Historic Houses.

Wimbledon was once insignificant as compared with its neighbour Merton, which, famous for its Augustinian Abbey, established in the 12th century, lost much of its importance on the Dissolution of the Monasteries. It was at Wymbaldune that, in the year 568, the West Saxons under Ceaulin defeated the men of Kent under Ethelbert. After the death of Thomas Cromwell, to whom Wimbledon belonged, Henry VIII. with fine magnanimity, passed Wimbledon on to the Queen who outlived him, Catherine Parr. Wimbledon, about this time, appears to have constituted a Royal plaything to be handed about as a reward to the most favoured courtier. Upon the death of Catherine Parr, or rather Lady Seymour as she was then, the property again became a possession of the Crown. After passing through the hands of many temporary owners, Wimbledon was brought by Thomas Cecil (afterwards first Earl of Exeter), who built the famous Elizabethan house, with its great flight of balustraded steps and its formal gardens. The house was demolished, however, at the instigation of "Queen Sarah," Marlborough's Duchess, upon her acquisition of the estate, and a new mansion was erected from the designs of the Earl of Pembroke. This building was destroyed by fire in 1785. Eagle House, a fine Elizabethan mansion erected in 1615, still stands, and is situated well back from the High Street, in proximity to the common. It is widely known as a rare and excellent example of Elizabethan work, and is the home of Mr. T. G. Jackson, R.A.

The Lay-out.

As to its lay-out, Wimbledon, located as it is, half in a valley and half on the side of a hill, is sharply divided into two distinct parts, north and south, the line of demarcation being that of the railway, which is crossed by a wide bridge. The railways have had a lamentable influence upon the disposition of the southern part of the town. Running from the north-east in a south-westerly direction, the L. and S.W. Railway is joined just before reaching the station, by, on the left, the L.B. and S.C. Railway, and on the right, the District Railway, the junction forming a sharp arrow-head on plan. This has naturally involved the wasting of two triangular pieces of land, and completely ruins the lay-out of this part of the borough. The roads have naturally followed the curvature of the railways, thus rendering impossible any comeliness of town-planning. This is the chief reason why Wimbledon to-day, like many another London suburb, is a hopeless jumble of incongruities.

Lost Opportunities.

This failure is the more regrettable when it is remembered that, but little more than twelve years ago, the greater part of South Wimbledon was open meadow land. The possibilities of convenient and dignified development were enormous, and a little intelligent forethought could have made Wimbledon a model suburb. But the roads were laid out without any obvious consideration for any rational principle of town-planning. The capricious setting-out of thoroughfares in inconvenient and illogical order seems, even at that comparatively recent date, to have been regarded as a merit. Nevertheless, a prosperous time of building activity set in, and very soon the district was covered with rows of small houses with monotonous square bay-windows, each house exactly similar to the others, and most of them covered with creeping plants which lend them the only grace they possess.

Wimbledon is in one way fortunate in having its most important buildings situated at one centre; the Town Hall, the fire station, the police station, and the police court, all being within a few yards of each other, and but a short distance from the railway station. The Town Hall, lately the Urban District Council Offices, is an ordinary example of suburban Renaissance in red brick, with terra-cotta quoins, pilasters, window frames, entablature, etc. The small pediment which surmounts the central first floor triple window has been smothered by the addition of a large two-faced projecting clock. A protracted controversy still rages round the question of a new town hall; and apart from the eternal question of expense, it must be admitted that the town is worthy of a finer building than that in which the affairs of the borough are now administered.

South Wimbledon.

To put the case very mildly, South Wimbledon is not rich architecturally, despite the presence of several churches, of which St Winifride's (Roman Catholic), is perhaps the most notable. Romanesque in feeling, the church consists of nave, aisles, and transepts, and has an impressive interior. In close proximity is the Wesleyan Church, which, although comparing unfavourably with its neighbour externally, has an attractive interior. Both churches are situated on a part of the main road where it turns at an abrupt angle and meanders in the direction of Merton to join the High Street. The most recent addition to Wimbledon's ecclesiastical architecture is the church of St. Andrew's, which has been erected in the south-western quarter of the borough from the designs of Mr. William Thorold Lowdell. The Technical Institute, which is also in this neighbourhood, is a large red-brick building, with stone dressings, and is even now undergoing considerable enlargement.

The extreme verge of the south side of the town houses the poorest classes; and it is in this quarter that some excellent open spaces have been provided. Wandle Park is a recent addition to the Corporation's recreation grounds, which are now five in number. The park, some twelve acres in extent, situated on the river from which it derives its name, is a beautiful piece of scenery in spite of the squalor of its surroundings.

Street Widening.

The recent arrival of the London United Tramways Company, with their heavy and noisy cars, was productive of one good result, namely, the widening of the main thoroughfare. North Wimbledon, that part of the town situated upon the hillside and extending to the common, is mainly made up of middle-class dwellings of fair size. The electric cars run no further than to the foot of the hill, which is of very steep gradient. The main track, however, is continued along Worple Road, through Raynes Park, a rapidly growing district, and on to Kingston and Hampton Court. Having to economise in the matter of widening roads, the Tramway Company have laid only a single track over several sections of the thoroughfare mentioned, giving an appearance, on plan, as of a long snake that has swallowed a series of big boluses at considerable inconvenience to its digestion.

Wimbledon Hill, the continuation of the main thoroughfare, is a broad, steep road, well wooded on each side, the pathway on one side being separated from the roadway by a wide bed, in which shrubs and trees are cultivated. The houses on the other side are chiefly of early Victorian origin, while those on the right are modern and far more comely. At the top of Wimbledon Hill runs the Ridgway, which is said to be one of the early Roman roads; and at the further end of the picturesque High Street, a little beyond Eagle House, stands the "Rose and Crown," where Algernon Charles Swinburne was wont to drink a daily glass of ale. The large area of undulating ground that flanks the greater part of the south-east side of the common, latterly a private demesne, in which the great Elizabethan mansion stood, is now being developed in the builders' sense. The hilly nature of the estate has had considerable influence upon the setting-out of the roads, and consequently the architects have encountered many interesting problems. A little beyond the confines of this estate stands the Parish Church of St. Mary, a somewhat uninteresting version of Late Gothic, erected in 1843. The Conqueror's Survey mentions a church as standing within the Manor. The church, situated on a lofty eminence, commands a delightful prospect of the park below; and a short distance past the church, along the Arthur Road, may be obtained a view of what is undoubtedly the finest piece of scenery in Wimbledon. A deep valley curves away from the feet and stretches up to wooded heights beyond. A large lake shimmers at the bottom, and the club house of the Wimbledon Park Golf Club stands on its edge. The links are immensely popular. In north-west Wimbledon is situated the Roman Catholic Church of the Sacred Heart, an ornate building of modern erection in fifteenth century Gothic style. Approached from the south, the church, which consists of nave, aisles, side chapels, and chancel, standing upon a large sloping site, appears of almost cathedral-like dimensions. There is a fine range of flying buttresses round the chancel end. One of the side chapels has an intricately vaulted roof. At the top of Edge Hill, the very steep road in which the church stands, we again come upon the Ridgway, beyond which, and situated in extensive grounds, is King's College School, moved here from London some few years ago. The common is so well known that it calls for no remark.

THE DANGERS OF FÊTES.

The terrible fire in Hungary, which resulted in the loss of about 300 lives, is an astonishing revelation of almost incredible human folly. A large barn-like structure, the coach-house of an inn, was profusely decorated with pine branches, which had become as dry as tinder. To these were added Chinese lanterns with candles burning in them. The occasion was a dance; and all the ticket-holders having arrived, the single narrow door to the building was nailed up to prevent the intrusion of unauthorised persons. One of the pine branches caught fire. There was an instant rush towards the nailed up door, against which many persons were crushed to death. The blazing roof fell in, apparently before anyone could escape; and it is a marvel that any human being got out alive from the inferno that was thus gratuitously created. It is easy to say that such an extraordinary disaster could only have happened among the ignorant peasantry of a country that has no great reputation for practical wisdom; but is it not only too probable that all the elements of a similar capacity, except the nailing-up of the one exit, exist in sundry districts of our own land? There is no doubt that the public of all countries are greatly in need of instruction in the mere elements of precaution against fire. Hence our repeated advocacy—so sadly enforced by this disaster at the Hungarian village of Oekoerito—of systematic teaching on the subject in the elementary and other schools.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about five days or longer after the date of this issue.
Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders.
The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the Contract, which requires them to pay the rates of wages current in the district.

BUILDING.

April 9—May 3. **DEPTFORD.**—Erection of a branch library on the site in New Cross Road, S.E., for the Corporation, according to the drawings and specification prepared by Castle and Warren, Architects, and to be seen at their offices at Talbot House, Arundel Street, Strand, W.C. Persons intending to tender were to send in their names to the Town Clerk so as to be received by him on or before Saturday, April 9, 1910, accompanied by a deposit of £2 2s. Bills of quantities, prepared by Dow, White, and Gee, of 12, Craven Street, Strand, W.C., together with the conditions of contract, would then be forwarded. Tenders must be delivered to the Town Clerk at the Town Hall, New Cross Road, S.E. The contractor will be required to subscribe to the wages clause embodied in the conditions of contract.

April 25. **BIRKENHEAD.**—(See "Plumbing and Sanitary.")

April 25. **SALTFLEET.**—Rebuilding of the Golden Lion Inn at Fishtoft, and the Crown Inn at Saltfleet, for Soulby, Sons, and Winch, Ltd. Plans may be seen and bills of quantities obtained on application to R. H. Fowler, Architect, Louth.

April 25. **KEIGHLEY.**—Erection of a foundry and machine works at Strong Close, Keighley. Drawings may be seen and bill of quantities obtained, and tenders to be delivered at the offices of Moore and Crabtree, architects, York Chambers, Keighley.

April 25. **SENGHENYDD.**—Erection of 16 houses including sewers and lanes. Plans and specifications may be seen at the office of Arthur Ll. Thomas and Gomer S. Morgan, Architects, Church Street Chambers, Pontypridd, to whom tenders must be sent.

April 25. **HALIFAX.**—Alterations and additions to the Halifax Golf Club. Plans and specifications may be seen and bill of quantities obtained at the offices of Utley, Hebblethwaite and Utley, architects, 10, Waterhouse Street, Halifax. Tenders are to be sent to the architects.

April 25. **EAST MOLESEY.**—Alterations and additions to manufacturing premises at Creek Road. The drawings may be seen, and specification and form of tender obtained, upon deposit of £1 1s. Tenders to be delivered at the office of the Architects, Fuller, Horsey, Sons, and Cassell, 11, Billiter Square, E.C.

April 25. **EASTBOURNE.**—Alterations and additions to the entrance lodge at Ocklynge Cemetery, for the Burial Board. For plans and specifications apply to C. Montague Wood, architect, 79, Whitley Road, Eastbourne. Tenders to be sent in, addressed to Coles and Sons, and Tilburn, Clerks, Claremont Chambers, Eastbourne.

April 25. **ORRELL (Wigan).**—Persons desirous of tendering for the whole or any separate trade required in the erection of the Primitive Methodist Sunday School, are requested to forward their name and address and trade to W. G. Smithson, A.R.I.B.A., 13, Bond Street, Leeds, when bills of quantities will be supplied when ready.

April 25. **BEDWAS.**—Erection of fourteen semi-detached houses at Bedwas for the Tydfil Road Building Club. Plans and specifications may be seen at the Blackwood office of Ralph Simmonds, Architect and Surveyor, Blackwood, or at Bedwas by appointment. Tenders to be delivered to the Chairman, E. Lewis, Church Street, Bedwas.

April 25. **EGREMONT (Cumberland).**—Converting buildings into masonic hall, and for building ante-rooms, lavatories, etc. Also for gutting and reconstructing dwelling house, erection of boundary wall, gates, etc. Particulars can be obtained upon application to James Lowery, secretary to the Trust, 59, Main Street, Egremont, and tenders will be received by the Secretary.

April 25. **COVE (Southampton).**—Erection of a new Council school for 140 children at Cove. Plans, specifications, and conditions of contract (no quantities) may be seen, and other information obtained, at the office of W. J. Taylor, County Surveyor, The Castle, Winchester, on and after Monday, April 4. A copy of the plans and specification will also be deposited at the existing school at Cove. Tenders are to be delivered to H. Barber, Clerk of the County Council, The Castle, Winchester.

April 25. **KEADY AND GORAGHWOOD (Ireland).**—Erection of station-master's house at Keady, and two cottages at Goraghwood, for the Great Northern Railway Company (Ireland). Parties wishing to tender may see the plans and specifications at the office of F. A. Campion, chief engineer, Amiens Street Terminus, Dublin, or copies of them at the office of the District Engineer, Belfast, and can obtain at the offices forms of tender. Tenders should be delivered to T. Morrison, secretary, Amiens Street Terminus, Dublin.

April 25. **EASTWOOD (Essex).**—Erection of a cowshed for eight cows, on land adjoining the Council school at Eastwood, for the Essex C.C. The cowshed must comply with the dairies, cowsheds, and milkshops orders, and any regulations made thereunder, and also with any local bye-laws, and subject thereto, it should be constructed of weather-boarding on a brick foundation, with concrete floor and tiled roof. Tenders (with plans and specifications) should be sent to the Clerk of the Council, Shire Hall, Chelmsford.

April 26. **DURHAM.**—Erection of house. Plans, etc., at City Accountant's Office, 6, Saddler Street, Durham, where bills of quantities are obtainable.

April 26. **ABERCYNON.**—Erection of 16 or more cottages, for the Goitre-Coed Fawr Building Club. Plans and specifications may be seen at the office of William Dowdeswell, Architect, Treharris. Tenders to be delivered to Edwards Bros., Accountants, etc., Cambria Chambers, Dowlais.

April 26. **FRIZINGTON (Cumberland).**—Erection of a dwelling house, Frizington, for Jos. Jackson. Plans and specifications can be seen at The Result, Frizington, also on application to W. G. Scott and Co., architects and surveyors, 2, Park Lane, Workington, who will receive tenders.

April 26. **POOLE.**—Extension of the scullery at the workhouse, in accordance with the plan and specifications, which may be inspected on application to Ed. Van Schepdael, Architect, Tincleton Villa, Wimborne Road, Poole. Tenders must be sent to P. E. L. Budge, Clerk to the Guardians, Union Offices, 139, High Street, Poole.

April 26. **ILFORD.**—Erection of a block of offices at the Electricity Works, Ley Street, for the U.D.C. Plans, specification, and form of tender may be obtained on application to H. Shaw, M.I.C.E., Engineer and Surveyor to the Council, Town Hall, Ilford, on deposit of £2 2s. Tenders must be delivered to Adam Partington, Clerk and Solicitor to the Council, Town Hall, Ilford.

April 26. **ROCK FERRY (Birkenhead).**—Erection of a sorting office, Rock Ferry, Birkenhead, for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to W. Gilruth, H.M. Office of Works, Head Post Office, Liverpool. Bills of quantities and forms of tender may be obtained at H.M. Office of Works, Storey's Gate, London, S.W., on deposit of £1 1s. Tenders must be addressed to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

April 26. **CHELMSFORD.**—Works in their cattle market, for the B.C.:—1, construction of a roof over Rodd and Slipper's stand; 2, construction of a roof over Offin and Rumsey's auction ring; 3, erection of a small horse shed of corrugated iron; 4, fixing new manger in, and repairing, existing horse shed. Specification and form of tender, and full particulars, may be obtained, and the plans may be inspected, at the Borough Surveyor's Office, 16, London Road. Tenders must be delivered at the office of W. Smith, Town Clerk, Municipal Offices, 16, London Road, Chelmsford.

April 26. **GLASGOW.**—Clearing the site, putting in foundations, etc., in connection with the erection of a labour and telephone exchange in College Street, for the Commissioners of H.M. Works and Public Buildings. Tenders are required for the whole work, and not for separate trades. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to Kennedy, Clerk of Works, General Post Office, Glasgow (Hanover Street Entrance). Bills of quantities and forms of tenders may be obtained at H.M. Office of Works, 3, Parliament Square, Edinburgh, on deposit of £1 1s. Tenders must be delivered addressed to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

April 27. **DUBLIN.**—Erection of a building and other alterations, at the Queen's County Infirmary, for the Committee of Management. Plans and specifications to be had at infirmary.

April 27. **TONYREFAIL.**—Erection of 34 houses at Coed Ely, Tonyrefail, for the No. 2 Coed Ely Building Club. Plans and specification may be seen at the office of Arthur LL. Thomas and Gomer S. Morgan, Architects, Church Street Chambers, Pontypridd. Tenders to be sent to J. R. Thomas and Watkins, Market Chambers, Pontypridd.

April 27. **WIGAN.**—Erection of the People's Palace and Opera House in Wigan, for the William Benson Theatre Enterprises, Manchester Chambers, Market Street, Manchester. Persons desirous of tendering can see plans and obtain bills of quantities and particulars from the architects, Heaton, Ralph, and Heaton, King Street, Wigan, Lancashire. Tenders to be sent to the architects.

April 27. **BROOMFLEET.**—Erection of a house, stables, granary, cart and waggon sheds, and for the construction of a road, for the Humber Conservancy Board. Plans and specifications may be seen and further particulars obtained on application to the Engineer to the Board, A. E. Butterfield, and tenders should be delivered to Alfred W. Franklin, Clerk, Humber Conservancy Offices.

April 27. **KENNINGTON (Ashford).**—Rebuilding of Bybrook bridge, Kennington, near Ashford, for the Bridges and Roads Committee. Persons desirous of tendering can obtain the necessary bill of quantities and tender form at the office of Frederick W. Ruck, County Architect, 86, Week Street, Maidstone, when the plan and specification can also be inspected. Tenders to be delivered to the Architect.

April 27. **LONDON (Westminster).**—(See "Engineering.")

April 27. **CREWE.**—Erection of a sorting office, Crewe Station, for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to the Postmaster, Head Post Office, Crewe. Bills of quantities and forms of tender may be obtained at H.M. Office of Works, Storey's Gate, London, S.W., on deposit of £1 1s. Tenders must be addressed to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

April 27. **WOOLWICH.**—Additions, alterations, and repairs to a mission hall in Francis Street, North Woolwich, to adapt same for use as a branch public library, for the B.C. Persons or firms desirous of tendering may, upon depositing the sum of £1 1s., obtain copies of the drawings, specification and form of tender at the office of J. Rush Dixon, M.Inst.C.E., Borough Engineer, Town Hall, Woolwich. The person or firm whose tender is accepted will be required to pay Trades Union rates of wages, to observe Trades Union hours of labour, and to enter into a formal contract. Tenders must be sent to Arthur B. Bryceson, Town Clerk, Town Hall, Woolwich.

April 28. **GLASS HOUGHTON (Castleford).**—Erection and completion of the new "West Riding Hotel," at Glass Houghton, near Castleford. Send names to Ernest E. Pickersgill, Architect, Brewery Offices, Pontefract, before April 21. Quantities may be obtained, and plans and specifications inspected after that date at same address.

April 29. **DEWSBURY.**—Enlargement of the dispensary at the Dewsbury and District General Infirmary. Plans and specifications may be seen and bills of quantities obtained, from April 22, at the offices of Kirk, Sons and Ridgway, F.R.I.B.A., Architects, Surveyors and Valuers, Market Place, Dewsbury. Tenders to be delivered to the architects.

April 29. **DANBURY.**—Erection of a small brick water tower and other work incidental thereto at Danbury, for the Chelmsford R.D.C. Drawings may be seen and a copy of the conditions, specification, and form of tender obtained on application to James Dewhirst, A.M.I.M.E., Engineer and Surveyor, Bank Chambers, Chelmsford, to whom tenders must be sent.

April 29. **WHITBY.**—Erection of a new Drill Hall, and for carrying out sundry alterations to the Union Mill for converting it into headquarters for the local Territorial Force. Plans and specifications for the work may be seen at the architect's office, from whom bills of quantities may be obtained, and to whom tenders are to be sent. Edward H. Smales, A.R.I.B.A., Architect, 64, Baxtergate, Whitby.

April 29. **LEYTONSTONE.**—Erection of a new county high school for 300 girls, to be erected at Forest Road, Leytonstone, Essex, for the Education Committee, in accordance with plans and specifications prepared by the architect, W. Jacques, A.R.I.B.A., 2, Fen Court, Fenchurch Street, London, E.C., at whose offices the plans and specifications, together with forms of contract, may be seen on any day except Saturday. Builders and contractors wishing to tender must send their names and addresses, together with a deposit of £5, to the Architect, on or before Monday, April 11, 1910. The contractor whose tender is accepted will be required to give the bond of an approved guarantee society in the sum of £1,000 as security for the due performance of the contract. Tenders to be delivered to R. Dempsey, Clerk to the Leyton District Sub-Committee.

April 30. **BLENNERHASSET.**—Erection of new cloakrooms, at the Council school, for the Cumberland Education Committee. Plans and specifications can be seen at the office of the Clerk of Works, 13, Earl Street, Carlisle; or on application to F. Richardson, Solicitor, Aspatria.

April 30. **FALMOUTH.**—Additions and alterations to the Falmouth Grammar School, for the Governors, the work including heating of the premises by hot water, according to plans and specifications, which may be seen by appointment at the school, or at the office of the Architect, Sampson Hill, Green Lane, Redruth. Tenders to be sent to R. J. Loney, Clerk, 26, Norfolk Road, Falmouth.

April 30. **WINTERBOURNE (Dorset).**—Alterations and additions to farmhouse, buildings, and cottages, at Winterborne Zelstone Farm, in order to adapt them for small holdings, etc., for the Dorset C.C. Plans, specifications, and forms of tender may be seen at the cottage occupied by Leonard Young, Winterborne Zelstone. Tenders to be sent to E. Archdall Ffooks, County Council Office, Sherborne.

April 30. **GLASGOW.**—Materials and jobbing work required in the various departments for one year from June 1 next, as follows:—1, ashlar; 2, ashphalte grouting; 3, ashphalte paving;; 4, brick work; 5, Caithness and Arbroath pavements; 6, cartage work; 7, causeway work; 8, joiner work; 9, manholes and gratings; 10, painter work; 11, paving and drainage works; 12, plaster work; 13, plumber and gasfitting work; 14, repairing barrows, etc.; 15, smith work; 16, slater work; 17, whin and granite metal and blinding. Specifications and forms of offer may be obtained on application at the office of public works, City Chambers, 64, Cochrane Street. Offers must be sent to A. W. Myles, Town Clerk, City Chambers, Glasgow.

April 30. **GOODMAYES (West Ham).**—Alterations and additions, Little Heath House, Goodmayes Asylum, for the Borough Council. Plans and specification may be seen, and form of tender, bills of quantities, and further particulars obtained at the office of John G. Morley, Borough Engineer, Town Hall, West Ham, E., upon deposit of £1 1s. Note.—No tender will be considered unless the same is delivered at the office of the Town Clerk, Town Hall, West Ham, E., in the envelope supplied, by registered post. The contractor will be required to enter into a bond with one surety for the due performance of the contract, and no work will be ordered under the contract until such bond has been duly executed. The contractor whose tender is accepted will be required to pay the whole of his workmen such rate of wages and observe such hours of labour as are recognised by the workmen's trade unions, and shall not assign nor underlet or make a sub-contract with any person or persons for the execution of any part of such work. In the event of any breach of such agreement the Council will enforce the penalty clause in its entirety.

May 2. **SALFORD.**—Erection of a covered way to connect the Municipal secondary school for girls and the Education Office, for the Education Committee. Specification and drawings may be obtained from the Director of Education, Education Office, Chapel Street, Salford.

May 2. **PONTYPRIDD.**—Alterations and additions to Trallwn Bakery, Trallwn, Pontypridd, for Hopkin Morgan. Plans and specification can be seen and bills of quantities obtained on deposit of £2 2s. Tenders to be sent to A. O. Evans, Williams, and Evans, Architects, Pontypridd.

May 2. **LONDON.**—Erection of stables in Scotland Yard, for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to Sir Henry Tanner, I.S.O., at H.M. Office of Works, Storey's Gate, London, S.W. Bills of quantities and forms of tender may be obtained at the same address on deposit of £1 1s. Tenders must be delivered, addressed to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

May 2. **LUTON.**—Erection of school buildings to accommodate 350 children on Beech Hill, Dunstable Road,, for the B.C., in accordance with plans, specifications, and conditions of contract, which have been prepared by J. R. Brown and Sons, Architects, Castle Street, Luton, and which may be inspected at their offices. Bills of quantities and forms of tender may be obtained from the Secretary to the Committee, Town Hall, Luton, on deposit of £1 1s. Deposits must be made by cheque payable to the Corporation of Luton (Education Account) and crossed "Messrs. Barclay and Company, Limited, Luton Bank," or particulars will not be sent. The person whose tender is accepted will (subject to the consent of the Local Government Board to the necessary loan being obtained) be required to enter into a bond with approved sureties to an amount of £2,000, for the due performance of the contract. Tenders are to be delivered to Bruce Penny, Town Clerk, Town Hall, Luton.

May 4. **MANCHESTER.**—Alterations to the boiler-house at the Swinton schools, for the Guardians. Bills of quantities may be had from the office of A. J. Murgatroyd, Architect, 23, Strutt Street, Manchester, upon deposit of 10s. 6d. Tenders to be delivered to James Macdonald, Clerk to the Guardians, Poor Law Offices, New Bridge Street, Manchester.

May 4. **CAMBRIDGE.**—Erection of two cottages in Albion Row. Plans and specification may be seen at the office of the Surveyor, Guildhall, where further particulars, together with form of tender, may be obtained. Tenders to be sent to J. E. L. Whitehead, Town Clerk, Guildhall. The contractor will be required to enter into an agreement for the due performance of his contract.

May 4. **WANSTEAD.**—Erection of a foreman's cottage at the Wansted Sewage Farm, Empress Avenue, Manor Park, for the U.D.C. Copies of plans and specification can be obtained on application to the Surveyor, C. H. Bressey, Council Offices, Wanstead, N.E., on deposit of £1. Tenders to be delivered at the Council Offices, Wanstead, N.E. For terms of payment and other conditions, see draft contract, which can be inspected at the Council Offices during office hours.

May 6. **WEST RIDING (Yorkshire).**—Whole or separate tenders for the following:—Hensall Council School—Alterations and additions; Denby and Cumberworth Birdsedge Proposed Council School—Builder, joiner, slater, plumber, plasterer, painter; for the Education Committee. Plans may be seen and specifications with quantities obtained on application to the Education Architect, County Hall, Wakefield. A deposit of £1 in each case must be sent by separate letter to the West Riding Treasurer, County Hall, Wakefield. Tenders must be addressed to Francis Alvey Darwin, Clerk of the County Council, County Hall, Wakefield.

May 17. **BRIDGEND.**—Erection of a new boardroom and offices at the workhouse, for the Guardians. Plans, etc., may be seen, and all particulars obtained at the office of P. J. Thomas, architect, Bridgend. Tenders to be sent to R. Harmar Cox, Clerk, Union Offices, Bridgend.

May 17. **HARTLEBURY.**—Provision of all materials for, and the erection of new schools, in accordance with the drawings and specification prepared by the Architect to the Governors, S. S. Reay, F.R.I.B.A., 4, Unity Street, College Green, Bristol. Drawings and specification may be seen at the offices of the Architect. Quantities may be obtained on deposit of £2 2s. Tenders to be delivered at the office of C. Hugh Watson, Solicitor, Stourport, Clerk to the Governors.

No date. **HOLYWELL.**—Erecting new chancel and vestries at Greenfield Church, Holywell. Plans and specification may be seen and quantities obtained from Minshull and Muspratt, Architects, 25, Old Bank Buildings, Chester.

No date. **MOLD.**—Erection of a proposed residence at "Pendre," Mold, for John James Pownall. Those desirous of tendering should apply for further particulars, to F. A. Roberts, Architect and Surveyor, Earl Road, Mold.

ENGINEERING.

April 25. **ROTHWELL (Yorks.).**—1, laying of about 583 yards of deep sewer with 9in. earthenware pipes, together with manholes, etc.; 2, laying of about 197 yards sewer with 9in. earthenware pipes, together with manholes, etc., for the U.D.C. Plans and general conditions may be seen and form of tender and bills of quantities obtained (on deposit of cheque for £1 1s., made payable to the Treasurer of the Rothwell U.D.C.), upon application to J. Southwart, Engineer and Surveyor, Council Offices, Rothwell, near Leeds. Tenders must be delivered to Walter Dodgson, Clerk, Council Offices, Rothwell, near Leeds.

April 25. **CLECKHEATON.**—Provision, laying and jointing of about 1,820 yards of 12in. stoneware pipe sewer (partly in tunnel), together with the necessary manholes, etc., and also for the construction of settling tanks, storm tanks, percolating filter. Drawings and general conditions may be seen and specifications, bills of quantities, and form of tender obtained at the office of Clifton Lund, Engineer and Surveyor, Town Hall, Cleckheaton, upon deposit of £2 2s. The successful contractor will be required to enter into a contract and bond (with sureties), for the proper execution of the work. Tenders to be delivered to John H. Linfield, Clerk to the Council, Town Hall, Cleckheaton.

April 27. **WITTERSHAM (Kent).**—Laying about 650 yards run of 6in. pipe sewer, and other works in connection therewith; also for constructing a concrete retaining wall, in the parish of Wittersham, for the Tenterden R.D.C. Plans and specifications may be seen by appointment, at the office of W. L. C. Turner, District Surveyor, Tenterden. Tenders to be sent to J. Munn-Mace, Clerk, Tenterden, Kent.

April 27. **FISHGUARD.**—Construction of a sewer consisting of 66 yards of 9in. pipes, manholes, etc. Plans, specifications, and forms of contract can be seen with D. J. Wilcox, the Council's Surveyor, at his offices, High Street, Fishguard, from whom copies of specifications, quantities, and tender, can be obtained, on deposit of 10s. Tenders must be delivered to A. J. Hodges, Clerk to Council, Offices, Town Hall, Fishguard.

April 27. **LONDON (Westminster).**—Construction of a subway beneath Orange Street, Westminster, S.W., for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to H. N. Hawks, I.S.O., at which address bills of quantities and forms of tender may be obtained on deposit of £1 1s. Tenders must be delivered, addressed to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

April 28. **GUILDFORD.**—Providing and laying about 600 yards of 9in. stoneware pipe sewer in Warren Road, for the B.C. A plan may be seen and specification obtained on application to C. G. Mason, Assoc.M.Inst.C.E., the Borough Surveyor, at his office in Tun's Gate. Tenders to be sent to F. S. Miller, Town Clerk, Town Clerk's Office, Bridge Street, Guildford.

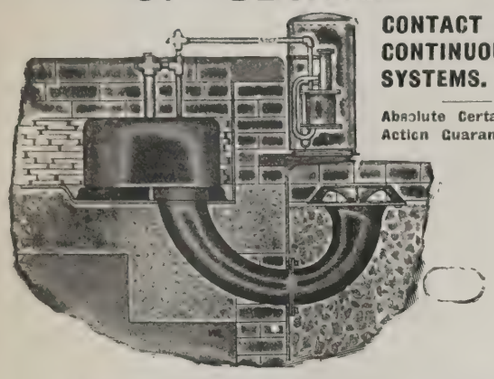
May 2. **PETERSFIELD.**—Heating apparatus and alterations to the ventilation of Petersfield Petty Sessional Court. Persons desirous of tendering may see plans and specification (no quantities) and obtain any further information at the office of W. J. Taylor, County Surveyor, The Castle, Winchester. Copies of the plans and specification will also be deposited at Petersfield police-station. Tenders on forms to be obtained from the County Surveyor, must be delivered to H. Barber, Clerk to the County Council, The Castle, Winchester.

May 3. **PADSTOW.**—Construction of a reservoir, trenching, and laying the pipes and fittings, etc., in connection with the Trevone water supply, for the St. Columb Major R.D.C. General and detail drawings and specifications may be seen and form of tender obtained at the office of the Engineer, G. A. Evanson, Market Hill, St. Austell, or at the office of Chas. E. Whitford, Clerk, Council Office, St. Columb. A deposit of £2 2s. will be required. Tenders must be delivered at the Council Office, Fore Street, St. Columb, and sureties will be required.

May 4. **COWES.**—Construction of a breakwater, 900ft. in length, on the Shrape in Cowes Harbour, in ferro-concrete (Hennebique system), for the Harbour Commissioners. Plans and specification may be seen, and form of tender, together with other particulars obtained from John W. Webster, engineer, Cowes, I.W. Tenders to be sent to H. C. Damant, Clerk to the Commissioners, High Street, Cowes, I.W.

May 4. **NAAS.**—Construction of pipe sewers, manholes, flush tanks, storm overflows, lamp holes, fences, filters, septic tanks, and concrete effluent carriers, the preparation including under drainage of about half a statute acre of land for irrigation ground, and other works, in strict accordance with plans and specification prepared by the Council's Engineer, F. Bergin, B.E., for the R.D.C. Plans, etc., can be seen at the office of D. J. Pursell, Clerk of Council, Council Offices, Naas, on any day (except Wednesdays and Saturdays), or at the office of the Council's Engineer, 36, Westmorland Street, Dublin. Tenders must be accompanied by a schedule of prices, and contain the names and addresses of two solvent sureties, willing to join in a bond of £500 for the performance of the contract within the specified period. The contractor will be expected to give preference to local labour.

May 7. **BELFORD (Northumberland).**—Mains, etc.—Supplying and laying of mains, etc., in connection with Beadnell and Swinhoe water supply, for the Belford R.D.C. Specifications and forms of tender can be had on application to C. A. Lake, district surveyor, Warenford, Chathill. Tenders to be sent to Adam Douglas, Clerk, Alnwick.



May 7. **SALE.**—Widening of Sale bridge, in reinforced concrete, for the Sale U.D.C. Full particulars, together with plans, may be obtained on application to the engineer, Henry Mattinson, A.M.I.C.E., 55, Piccadilly, Manchester, on deposit of £2 2s. Designs and estimates to be addressed to D. Hallewell, Clerk, Council Offices, Sale.

May 7. **SALE.**—Designs, estimates, etc., for a portion of the widening of sale bridge, Sale, in the County of Chester, in reinforced concrete, for the U.D.C. Full particulars, together with plans, may be obtained on application to the Engineer, Henry Mattinson, A.M.Inst.C.E., 55, Piccadilly, Manchester, on deposit of £2 2s. Designs and estimates to be addressed to D. Hallewell, Clerk, Council Offices, Sale.

May 18. **BIGGLESWADE.**—Construction of about 7¼ miles of stoneware pipe sewers, varying in size from 15in. to 6in., together with manholes, lamp-holes, ejector chambers, and other works; also for the laying of about 1¼ miles of cast-iron and steel rising and compressed air mains, from 10in. to 2½in. diameter, for the U.D.C. Plans and specifications may be seen, and bills of quantities and schedule of prices obtained, at the offices of the Engineer, J. T. Eayrs, M.Inst.C.E., 30, Corporation Street, Bir-

DOULTON & Co. LIMITED.

The "Hygeian" Gully.

This Gully affords great facility for inspecting and sweeping the drain. The Inspection Cover being on the surface, is readily accessible and always in sight. The Cover consists of a plate fitting into a fixed frame with tongue-and-groove joint, and is secured by gun-metal screws.

DIMENSIONS: Grating, 6 in. by 6 in.; Outlet, 4 in. diameter.

See our Catalogue for full particulars.

THE "City" INTERCEPTOR.

(Regd. No. 432023.)

In this design are embodied all the features proved by experience to be desirable from the point of view of the most modern sanitary practice.

The shape provides cascade action at inlet and weir at outlet, with rapid and self-cleansing flush. The body of water retained in the trap is the minimum compatible with efficiency and there is ample seal.

The cleansing-arm is of large diameter to permit of ready access to sewer, and the rectangular shape of the front enables the brickwork to be built up to it in a neat and workmanlike manner.

The illustration shows the inspection socket fitted with brass patent lever stopper, which can be released from top of manhole.

H.D 27. **LAMBETH, LONDON, S.E.**

mingham, April 25 to April 30, and also at the office of the Surveyor to the Council, Market Place, Biggleswade, from May 2 to May 7, on deposit of £3 3s. Tenders to be delivered at the office of Henry Chaundler, Clerk to the Council, Council Offices, Biggleswade, Beds. It is hoped that only substantial contractors with extensive experience in similar works will apply.

June 1. **MONTE VIDEO (Uruguay).**—H.M. Legation at Monte Video have forwarded copies of the specification, plans, etc., in connection with the invitation, by the Administration of the port of Monte Video, for tenders for the construction of two reinforced cement warehouses and six reinforced cement sheds. Tenders will be received up to 3 p.m. on June 1, at the Oficina de Trafico y Conservacion, Consejo de Administracion del Puerto de Monte Video, Calle Cerrito 185, Monte Video. The above-mentioned copies of specifications, etc., may be seen by British firms at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, London, E.C.

IRON AND STEEL.

April 25. **CLECKHEATON.**—Gates and railings in connection with their new secondary school, for the U.D.C. Full particulars may be obtained upon application to W. H. Thorp and Son, Phœnix Chambers, South Parade, Leeds. Tenders to be sent to the Clerk to the Council, Town Hall, Cleckheaton.

April 25—May 2. **BRISTOL.**—Steel.—Supply of wrought iron and mild steel, during year ending December 31, 1910, for the Sanitary and Improvement Committee. Specifications and forms of tender may be obtained at the offices of the City Engineer, 63, Queen Square, Bristol, on deposit of 10s. Sample bars as named in the specification must be delivered at the offices by 10 a.m. on April 25. Tenders must be delivered to the offices of the city engineer.

April 27. **ROCHDALE.**—Manufacture and delivery of about 400 tons of 12in. cast-iron pipes, for the Corporation Waterworks. A copy of the specification and form of tender can be obtained at the offices of H. Rofe and Son, 8, Victoria Street, Westminster, on deposit of £5 5s. Tenders to be sent to Wm. Henry Hickson, Town Clerk, Town Hall, Rochdale.

April 27. **LEICESTER.**—Supply and delivery at their Beaumont Leys sewage farm of about 1,000 yards of 9in. cast-iron socketted pipes, also a quantity of 6in. cast-iron socketted pipes and various special pipes, for the Sewage Works and Farms Committee. Copies of the general conditions, specifications, and quantities may be obtained at the office of E. George Mawbey, M.I.C.E., borough surveyor, Town Hall, Leicester, on deposit of 10s., which will be returned on receipt of a bona-fide tender. Cheques, etc., should be made payable to the Leicester Corporation. Tenders must be addressed to the Chairman of the Farms Committee.

No date. **BUCKHAVEN.**—Iron and steel work required in connection with the erection of a public slaughter-house, for the T.C. Forms of tender, schedules of measurement, and any other information required can be had from William D. Telfer, Burgh Surveyor, Municipal Buildings, Buckhaven, on deposit of £1 1s.

PAINTING.

April 25. **NEW MALDEN.**—Cleaning, distempering, and painting at the Central Homes for Children, Kingston Road, for the Guardians. Specification can be obtained on application to Chas. W. Dash, Clerk, Union Offices, Coombe Road, Kingston-on-Thames. Tenders should be sent to the Clerk. Contractors to pay the fair rate of wages current in the district, and for this purpose the fair rate of wages shall mean Trade Union rate.

April 26. **DUNDEE.**—Painter work to be executed on Nos. 93 and 95, Commercial Street, for the Water Commissioners. Specification and form of tender may be obtained on application to George Baxter, Engineer and Manager, Water Engineer's Office, 93, Commercial Street, Dundee. Tenders should be lodged with Wm. H. Blyth Martin, Clerk of the Commissioners, City Chambers, Dundee.

April 27. **ABRAM.**—Internal decoration of the Council offices. Specification, with full particulars, may be obtained from W. H. Roby, the Surveyor to the Council. Tenders to be sent to William Aspinall, Clerk to the Council, Council Offices, Abram, near Wigan.

April 28. **BLACKHILL (Durham).**—Painting and colouring the following Council schools:—Burnope, Consett Infants', Iveston, Edmondbyers, and Waskerley, for the Durham C.C. Education Committee. Tenders must be sent to J. R. W. Sherwood, 22, Queen's Road, Blackhill, from whom forms of tender may be obtained.

May 6. **MANCHESTER.**—Painting the iron bridges on the line of aqueduct, from near Ambleside to Agecroft, near Manchester, for the Waterworks Committee of the Corporation. Specification, form of tender, and all other information may be obtained on application to the Secretary, Waterworks Offices, Town Hall, Manchester.

May 7. **STANWIX (Carlisle).**—Outside painting, etc., of Stanwix Cemetery, for the Burial Board. Specifications may be seen, and the work pointed out, on application to the Curator. Tenders to be delivered to Wm. Dobinson, Clerk, 10, Bank Street, Carlisle.

June 12. **KIRKBY-IN-FURNESS.**—Re-painting the cottages at Herschell Terrace, for the Kirkby-in-Furness Co-operative Society. Specifications can be seen at the stores on application to the manager.

No date. **LEEDS.**—Painting outside of Crown Works, Harehills, Leeds.—For particulars apply, S. T. Midgley and Sons (Ltd.), Bramley, Leeds.

PLUMBING AND SANITARY.

April 25. **BIRKENHEAD.**—Construction and completion of an underground convenience and lavatory in the Market Square and Hamilton Street, for the Corporation. Plans and particulars may be seen and form of tender, with a copy of specification and bills of quantities, obtained at the office of Charles Brownridge, M.I.C.E., borough engineer and surveyor, Town Hall, Birkenhead, upon deposit of £1. Tenders to be sent to James Fearnley, Town Clerk, Town Hall, Birkenhead. Rate of wages, etc., clause to be observed.

ROADS AND CARTAGE.

April 25. **UXBRIDGE.**—Supply of granite, gravel and flints, the haulage of materials, and the purchase of surplus road sand and trimmings, for the Uxbridge R.D.C. Tenders must be sent to John William Harrison, engineer and surveyor, Corn Exchange, Uxbridge. Forms of tender, and any further information required, may be obtained from the Engineer.

April 25. **BURGESS HILL (Sussex).**—Supply of 775 tons broken granite, between 1¼in. and 2in. gauge, and 70 tons fine granite for binding. To be delivered free at Burgess Hill railway station, as required, by June 24, for the Burgess Hill U.D.C. Tenders on forms to be obtained from A. F. Hardwick, Clerk, Burgess Hill, with samples, to be delivered to the Surveyor of the Council.

April 25. **PENGE.**—Private street works in Kingsdale Road, within their district, for the U.D.C. Plans and specification may be see, and copies of the bill of quantities, with form of tender obtained on application to Herbert William Longdin, Surveyor, Town Hall, Anerley, S.E., on deposit of £2. Tenders, accompanied by priced quantities, to be sent to C. W. Dommett, Clerk to the Council, Town Hall, Anerley, S.E.

April 25. **LONDON.**—Supply of about 100 to 200 loads of good binding small gravel, suitable for garden paths, to their workhouse, 42, Clifden Road, Lower Clapton, N.E., the same to be approved by the Master and delivered at such times and in such portions of the grounds as he may direct, for the City of London Guardians. Estimates to be addressed to Edward R. Woodward, Clerk to the Board, 61, Bartholomew Close, E.C.

April 25. **STEVENAGE.**—Tar-paving the footpath (about 2,200 superficial yards), along the east side of High Street, the south side of Basil's Approach, and the north side of Providence Row. Also for paving with tar macadam the roadways (about 500 superficial yards) in Middle Row and Baker's Row, within their district, for the U.D.C. A plan of the proposed work can be seen, and a copy specification and form of tender can be obtained at the offices of the Council in Orchard Road, Stevenage. Tenders to be delivered to Wm. Onslow Times, Clerk to the Council, Urban District Council Offices, Stevenage.

April 25. **REIGATE.**—Supply of the following materials:—Granite macadam, basalt, and flints; granite kerb and setts; Kent ragstone; tar-paving material; artificial stone paving; gravel; concrete beach; pea beach; compo, grit; Portland cement. Forms of tender, conditions of contract, and full particulars may be obtained upon application to Fred T. Clayton, the Borough Surveyor, and every person tendering will be required to deposit at his office, at the Municipal Buildings, Reigate, a sample of the materials for which he tenders. Tenders are to be delivered at the office of Alfred Smith, Town Clerk, Municipal Buildings.

April 26. **GOSFORTH.**—Carriageway and footway construction, for the U.D.C. All particulars may be obtained from George Nelson, A.M.Inst., C.E., Engineer and Surveyor to the Council, Council Chambers, High Street. A deposit of £2 2s. is required for quantities.

April 26. **HAZEL GROVE.**—Supply of broken stone, setts, kerbs, chippings, ashes, pipes, and other materials during the period ending March 31, 1911, for the U.D.C. Forms of tender and any other information can be obtained on application to G. Severn Doncaster, Surveyor, Council Offices, Hazel Grove. Tenders to be addressed to Frederick Pidgeon, Clerk, Council Offices, Hazel Grove, near Stockport. Contractors will be required to pay the trade union rate of wages and observe the trade union number of hours as are usually paid and observed in the district.

April 27. **HALE.**—Making-up of Alan Drive, for the U.D.C. Plans and specifications can be seen, and bills of quantities and forms of tender obtained, at the office of the Council's Surveyor, S. A. Pickering. Tenders to be sent to J. G. Whyatt, Clerk to the Council, Council Offices, Ashley Road, Hale, Cheshire.

April 27. **WOODHALL SPA.**—Supply of about 400 tons of granite (XX), to be delivered at Kirkstead or Woodhall Spa Stations, during the months of July, August, and September next, in such quantities, and at such times, as the Council or their Surveyor shall require, for the U.D.C. Samples to be sent to E. E. T. Bolton, Surveyor, Woodhall Spa. Tenders to be sent to J. E. Chatterton, Clerk, at 4, Church Lane, Horncastle.

April 27. **LEIGH.**—Supply of filtering material for six percolating filters, now being constructed for the Joint Sewerage Board, at their sewage works at Mather Lane, Leigh, Lancashire. The material may consist of suitable destructor works or other clean clinker, of clean stone, suitable slag, or other material fitted for the purpose. Particulars of the conditions may be obtained from Banks, Fairclough, and Stephen, Assoc.M.Inst.C.E., Leigh, Lancashire, the Board's engineers. About 11,000 cubic yards are required. Tenders to be delivered to D. Schofield, Clerk to the Board, Atherton Town Hall.

April 28. **CHATHAM.**—Supply of broken granite or other hard stone and surface picked flints, for the T.C. Specification, schedule, and form of tender can be obtained on application at the Borough Surveyor's Office, Town Hall, Chatham. Tenders to be delivered to Charles Day, Borough Surveyor, Town Hall, Chatham.

May 4. **ROMNEY MARSH.**—Supply and delivery of 220 yards of quartzite, to the following parishes and roads:—100 yards 2nd inch, Straight Road, Brookland; 200 yards 1in., Straight Road, Brookland; 20 yards 1in., Guldeford Road, Brookland; 20 yards 1in., Alliance Road, Brookland; 20 yards 1 in., Ivychurch Road, Brenzett; 20 yards 1in., Brenzett Road, Snave; for the R.D.C. To be delivered before September 1, 1910, and yarded at the expense of the constructor, in such manner and in such quantities as the Surveyor may direct, and subject to his measurement. Tenders to be delivered to William B. Smith, District Surveyor, New Romney.

MISCELLANEOUS.

April 30. **GLASGOW.**—(See "Buildings.)

April 30. **WAKEFIELD.**—Asphalting of play playgrounds at Westerton School, West Ardsley, and Wrenthorpe School, near Wakefield. Specifications of the work may be obtained from Alexander Angus, 128, Northgate, Wakefield, with whom tenders must be lodged.

Specification.

Price 3/6 nett, Annually.

No. 12, 1909-10, has been very drastically revised and brought up-to-date.

"Specification" provides in one volume all the information for professional men when preparing drawings, writing specifications, or compiling bills of quantities that had formerly to be sought in a large number of books. Invaluable to owners of land, building sites, country estates, and all connected with house property.

Price 3/6 nett. Postage 6d.

Practical Exemplar of Architecture.

Series I. and II. Price 12/6 each.

Edited by MERVYN E. MACARTNEY, B.A., F.R.I.B.A., F.S.A.

Being measured Drawings and Photographs of Fine Examples and Details for the use of those who desire to study the work of the masters in Architectural Design and Construction. The Plates are finely printed on stout art paper and collected in a neat portfolio so that each sheet can be detached for convenience of reference or study.

FIRST SERIES—120 Plates with Portfolio.
SECOND ., 112 Plates, 8 pp. Notes and Portfolio.

Price 12/6 nett. Post Free.

Recent English Domestic Architecture.

1908-9 and 1909-10.

Although the 1908 Edition is out of print and at a premium, copies can sometimes be obtained secondhand at 7s. 6d. nett, and applications should be sent to the Publishers.

1909 EDITION. PRICE, 5s. nett.

Both Volumes are superbly Illustrated. Printed on heavy art paper and bound in limp cloth.

Price 5/- nett. Post Free.

Practical Notes for Architectural Draughtsmen.

Price 12/- nett.

By ALFRED W. S. CROSS, M.A., F.R.I.B.A., and ALAN E. MUNBY, M.A., A.R.I.B.A

Gives in most convenient form for use on the drawing board, examples with concise rules, explanations, and dimensions for preparing designs, perspective, and working drawings for classical architecture. In handsome portfolio.

Price 12/- nett. Post Free.

New Cheap Binding Cases can now be obtained for THE ARCHITECTURAL REVIEW and THE ARCHITECTS' AND BUILDERS' JOURNAL. Price 1s. each; by post, 1s. 3d. Subscribers' Volumes being sent to the office will be bound in these Cases, complete with Index for 2s. 9d., carriage forward. A better class Binding Case can be obtained price 1s. 9d. each, or bound complete, 3s. 6d

The above Publications can be ordered at the Railway Bookstalls, at all Newsagents, or direct from the Publishers,

TECHNICAL JOURNALS, Ltd., CAXTON HOUSE, WESTMINSTER, LONDON, S.W.

(*Tenders continued from page xvi.*)

Guilford.—For erection of new premises, Haydon Place, Guildford, for the Guilford and District Co-operative Society, Ltd. T. J. Capp, 1, Stoke Road, Guildford, architect.

W. Smith and Sons	£2,700
A. Johnson	2,053
R. Smith	2,650

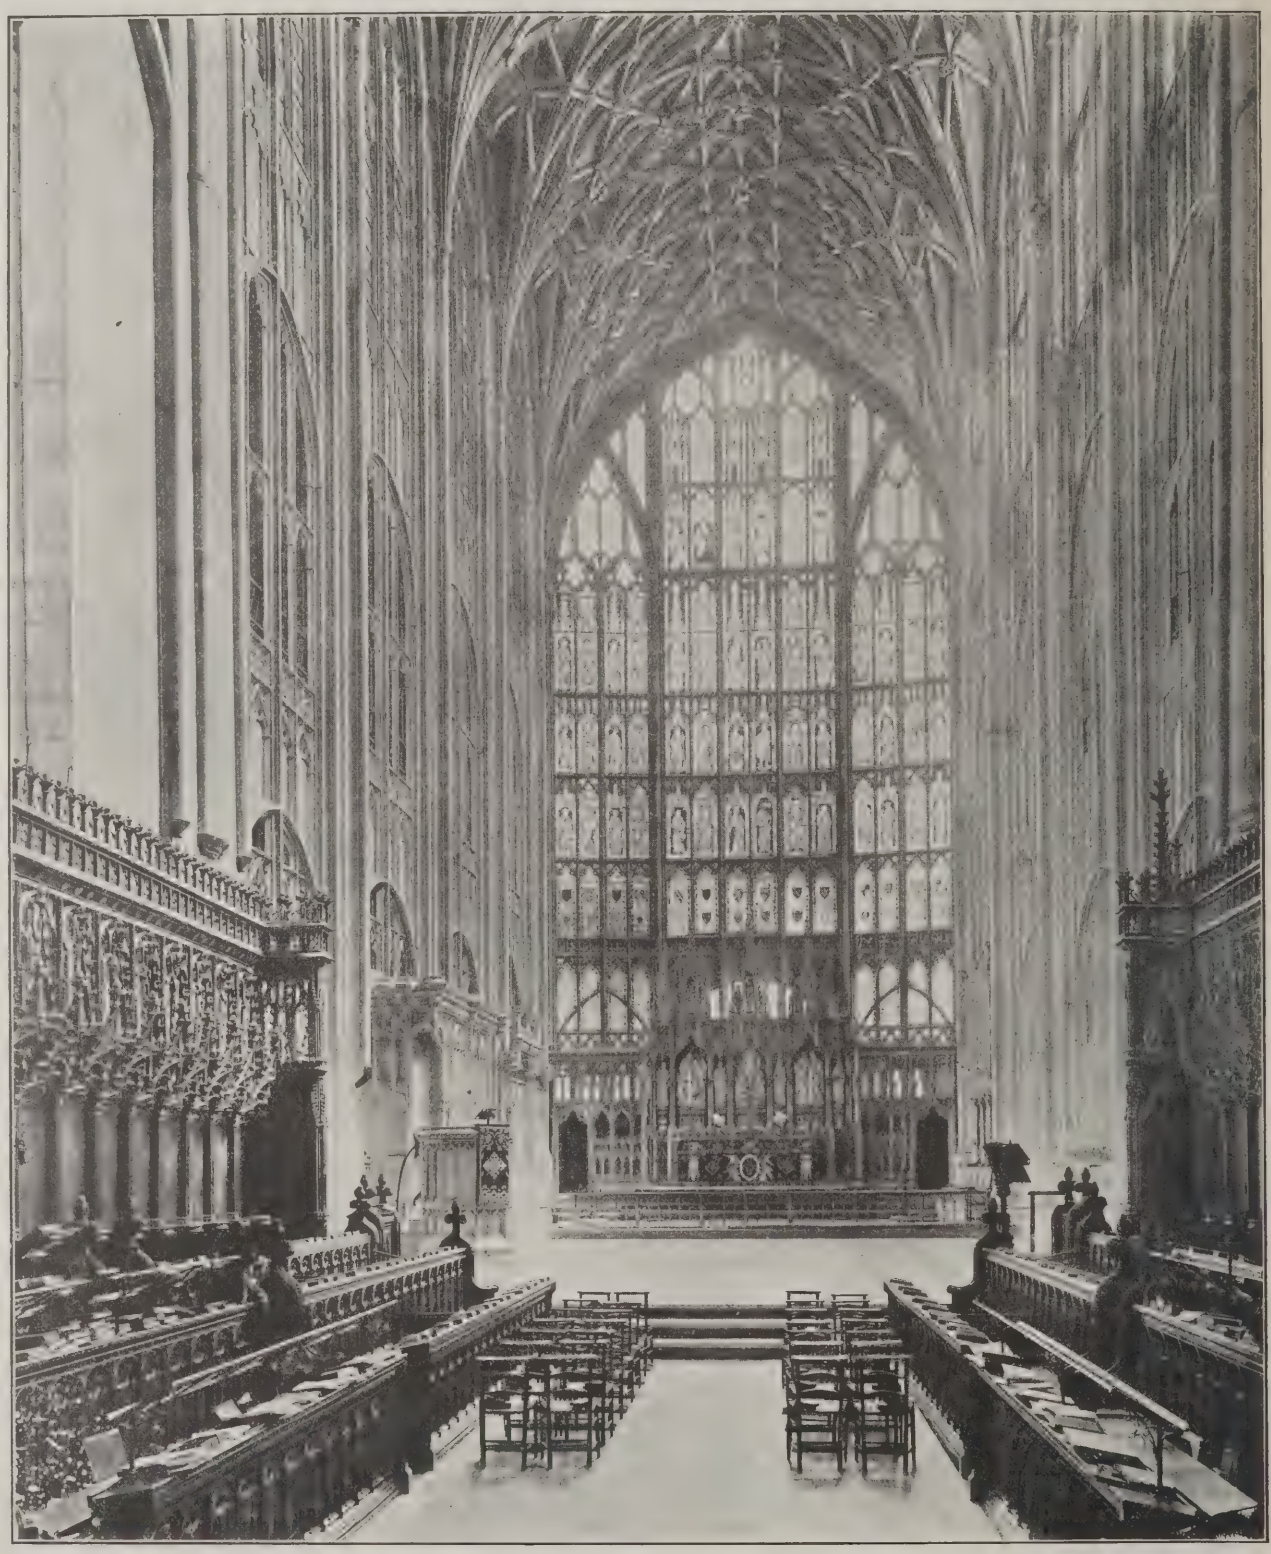
Volume XXXI. No. 795

St. Bride's, Fleet Street.



St. Dunstan-in-the-East.

St. Mary-le-Bow.

THREE CITY CHURCH SPIRES BY SIR CHRISTOPHER WREN.

The east window is a beautiful piece of Perpendicular work, its dimensions being 38 feet in width and 72 feet in height. It dates back to the years 1337-1377. The choir is mainly Norman, the visible Perpendicular work being cased over it. The stonework of the east window was repaired in 1862. The reredos was added by Sir Gilbert Scott, R.A., in 1873.

Do We Need a New Departure in Architecture?

EVERYTHING that Professor Lethaby has to say about architecture is worth serious attention. Not only does he bring to the consideration of architectural questions a very thoughtful and analytical mind, but he has also the great merit of entire earnestness and sincerity. His ideas upon architecture have often run counter to the prevailing theory and practice of the art; in some instances they may have been thought to be Utopian; but no one could ever doubt his sincerity, or suppose that he spoke or wrote merely for effect. And therefore his paper at the Institute, on "The Architecture of Adventure," deserves serious consideration as an attempt to suggest a new starting-point for modern architecture.

What Professor Lethaby means by "The Architecture of Adventure"—a title which occasioned a good deal of speculation in advance among those who saw it advertised—is the attempt to grapple with some new constructional problem, and his position is that this kind of effort has been at the root of all the great achievements in architecture in past times; *ergo*, that if we wish now to produce architecture which will be a real living art, and will have the same importance as the greatest architectural works of past times, we must found it on the attempt to solve new constructive problems; on "adventure" in grappling with new difficulties in construction.

There is undoubtedly a great deal that is very wholesome and stimulating in such a suggestion, and a good deal of truth connected with it; but the attempt to lay it down as the basis of all great architecture leads to paradoxes. In the first place, we must leave out Greek architecture, in some respects the most perfect of all; for it cannot be pretended that Greek architecture was based on the mastering of any difficult structural problem; the structural element in a Greek temple was of the very simplest, and in any case had been anticipated by the Egyptians. If we sought for some forming motive for Greek architecture, behind mere sense of beauty and fitness, we should look for it rather in the desire to produce buildings which were absolutely perfect in geometric relations of proportion. Secondly, Professor Lethaby's argument rather necessitated his assuming that all the greatest architects were actually engineers rather than what we mean by architect. This is pushing matters a great deal too far. There is no tradition that Ictinus was what we should call an engineer, though he was probably a learned geometrician; he was a man who knew how to set out temples in due proportion and refinement of parts. There was a great deal of the engineer, no doubt, in Anthemius, and Brunelleschi, and Wren; but there was surely something more than mere construction in their minds when they planned and erected their respective domes. Nor can one be satisfied with Professor Lethaby's definition of the mediæval cathedrals as merely the result of the effort to balance stonework high in the air. That is the constructional problem, no doubt, which made the style; but it did not make the designs for the separate buildings. No two cathedrals in England, even in portions of nearly the same respective dates, are alike; they are works of art; each of them produces a different effect on the mind. In France there is rather more similarity of type in buildings of the same date; but in the English cathedrals there is a remarkable freedom of individual design, which cannot be credited to mere construction. And it is the same with Wren's churches. Granted that Wren had a great deal of the engineer in his composition, and that St. Paul's is, in some respects, better engineering than architecture, there is evidence of remarkable versatility of fancy in the varied plans and designs of his churches, of which no two are alike; and that pleasing and interesting variety did not arise out of structural problems.

There are some very interesting remarks by Wren quoted in Professor Lethaby's paper, some of which are certainly new to many of us. It has been overlooked that Wren had, behind all his formal architecture constructed out of "The Renaissance box of bricks" (to quote a phrase of Professor Lethaby's on another occasion), a distinct idea of an art of architecture in the abstract, not necessarily connected with columns and pilasters; but he seems to have thought it hopeless to attempt to carry out architecture except "according to the taste of the age we live in"; a curious admission of the power of the Renaissance superstition—if it is so to be called. Professor Lethaby evidently regards it as such; he says the architects of that day looked to the past instead of the present. But if they had not, should we not have lost a great deal that is exceedingly charming, in the quasi-classic buildings of the Renaissance? And these were not mere copyism, either; Italian Renaissance produced a great deal that was new in architectural design. Another age may say the same of some of the buildings of this age; of two of them, at least, the Houses of Parliament and Westminster Cathedral. Both are founded on ancient styles; but both are effective and original.

To come back to the main question—do we need a new departure based on structural adventure, as Professor Lethaby phrases it? And if so, in which direction are we to venture? Because, after all, if we come to think of it, most of the possible ventures in construction have been gone into already. We can hardly build any larger domes than have been built. At present the one possible direction for Professor Lethaby's proposed adventure seems to be concrete-steel construction, and architects have yet to show what they can do with it.

The Forth Bridge, which was referred to in the paper, is the most remarkable example in modern times of a great structure evolved from a great constructional problem, that of bridging over a space much greater than had previously been attempted. But we can hardly call it architecture; and if we come to the monumental question, the best that the late Sir Benjamin Baker could say, when questioned as to the duration of the bridge, was that "with proper care, he did

not see why it should not last five hundred years." But five hundred years is not much of a time for monumental architecture. It is dangerous to prophesy about new methods in architecture. A very able man, the late E. L. Garbett, thought that the architecture of the lintel and of the buttressed vault having run their course, there was nothing left but the arch, with a tie at the springing; an engineer, he said, "could do as much with a pound of wire as with a ton of stone"; and the arch with tied skewbacks was, he confidently affirmed (some seventy or eighty years ago), "the destined architecture of the future." But his destined architecture has never come off.

What is really left in the way of valuable suggestion from Professor Lethaby's paper, after all deductions, is—first, that architects should be on the look-out for any new problem in construction that may arise, and regard it as a problem to be treated on its own basis, and not with mere reference to precedent; though at the same time we think that new problems in construction, of any such importance as to influence architectural design, are not likely to arise very often in the present day. Secondly, that we should endeavour, in designing a building for any special purpose, to think first of that purpose, and how it may best be provided for and expressed, instead of thinking first of producing a building with a certain external appearance, which would please the reigning taste of the day. This is only a secondary lesson derivable from Professor Lethaby's paper, but it is the most important one, because it is the one most generally applicable. Professor Lethaby, in his final notes of advice, recommended that Soane Medallion competitors should be set to study, for instance, the design and construction of a staircase, or something of that kind; but that line of competition is already especially provided for by the Grissell medal. The Soane Medallion competitions generally demand the plan and construction of a building for a special purpose. That is also a problem, and should be attacked from the practical point of view in the first instance, and let the architectural treatment express that.

Recurring to the question, "Do we need a new departure in architecture?" we should say, then, that new departures, or what are supposed to be such, are apt (like that proposed by Garbett) to prove illusory, and that they cannot be adopted or started self-consciously. If any important new departure does come about, it will probably be in the way suggested by Professor Lethaby, by the effect of a new problem in construction. Failing that, there is at least the secondary conclusion to be deduced from his paper, that architects should consider a church, for instance, not as a Gothic building with certain customary features, but simply as "a church"—what is the best form for it? That they should consider a theatre not as a building on a certain accepted pattern, but as a building capable of improvement on existing patterns, for its special purpose. An increased habit of regarding architecture in that spirit would at any rate save us from the repetition of devices with no meaning—bits of projecting panel cut short off, with meaningless wreaths depending like sausages from them; mere draughtsman's fashions. No permanent good can come to architecture from tricks of design of this kind.

An Archbishop on Art.

AT the opening of the new Art Gallery at Hull last week the Archbishop of York made some generally pertinent remarks as to the part which Art should take in the beautifying of modern life. Holding up for example the great cities of Greece, "so full of imperishable memories," he then referred to the example set for our own time by those gallant public-spirited cities of the Middle Ages in Italy; true enough for Florence and Venice, where there was, in their great days, a noble kind of passion for having all public buildings as artistically perfect as they could be made. There was nothing quite like that in England at any time. It may be true that "our old mediæval life, with its guilds and municipal institutions, was far more picturesque than now," but whether it was altogether "more happy," in its insanitary, violent, turbulent conditions, may be a question. It was happier, however, for the artisan, because in those days he made a thing in the way he enjoyed making it, and not merely in the way he was told to make it by a middleman. That is one thing we want in these days—to get rid of the middleman, who trades on what is falsely called art, and bring the real art-executant to the front and give him personal honour for his personal work; a point which the Archbishop did not touch on. But he made a good point in admitting the work which had been done in rendering our cities more healthy, while deprecating the dullness and the absence of imagination and romance in our modern municipal life. "Now," he said, "something more was wanted; we must bring into these well-built, well-trammed, well-streeted cities a little touch of the spirit of imagination, of colour, and of beauty." In referring to the new Art Gallery as a possible influence in this direction, the Archbishop touched on the importance of filling their Gallery with pictures of a superior order, and not the tawdry stuff which anyone could put upon canvas, "which might give a little passing pleasure, but would do no permanent good, and would certainly not fulfil the intentions of those who were present that day." Therein the speaker touched on one of the greatest difficulties in regard to art exhibitions for the masses—the difficulty of getting them to understand what painting is for, and what is the difference between good and bad painting. And therefore it is essential that the works of art—sculpture, painting, or applied art—for a public gallery should be chosen by a committee of artists or by a competent curator, and not by the municipal authorities. Give the people not what they like or would choose themselves, but what they ought to like. In time their taste will be educated to like it—and that is the real use of a public Art Gallery.

An American Report on American Art.

THE Report of the American Institute of Architects Committee on the present state of architecture and sculpture in America, a considerable portion of which is printed on another page, is in style and expression what might be called a *tirade*. A good many among us have thought it a pity that American architecture should be so much dragged at the heels of the Ecole des Beaux-Arts, instead of endeavouring to make and live a life of its own; but such criticism has hitherto been expressed, in this country at least, in considerate and measured language. The authors of the Report in question seem to think that the time for considerate talk has gone by. They seem, in fact, to have completely lost their tempers, and in the process to have become in places all but incomprehensible. "A period of existence is not a pin-prick in a dotted line, but is an integral increment in the ascending spiral." What are we to learn from this, and why is existence a "spiral"? The anger of the Report is specially directed against the unclean domination of Rome in American architecture; that is to say, that a number of public buildings are erected in the Classic style; very fine buildings some of them are. We read of "The canker of Rome," and find that "the Roman temple blisters the surface of the land, and worse, has gnawed into the brains of the people." One is tempted to exclaim with Mrs. Quickly, "By my faith, captain, these be very bitter words." For England, indeed, such an architectural slavery, we are told, is not surprising. "The social and political life of England, as expressed in its real democracy and its constitutional monarchy, is clearly echoed in its architecture, its half-hearted and lifeless governmental forms harking back to the Roman empire, and its beautiful homes telling of the life of to-day." But we in America, who "are not saddled with a monarchy," what have we to do with these Roman abominations? Well, we doubt whether politics have so much to do with the matter, after all. Under the

same political conditions we have had in England our Gothic revival, our mediæval Law Courts, and our Truro Cathedral; and (oddly enough) the American predilection for public buildings in the Classic style has been specially fostered by the architectural connection of America with another Republic, and by the fact that her leading architects are educated in the French art-school. So that it is evidently not monarchy (necessarily) that blisters a country with Roman temples. Architectural tradition has more to do with the matter than forms of government. Something might certainly be said against the tendency of modern America to take all her architectural ideas from France; but it should at least be put in a reasonable manner and with a perception that there in another side to the question. This Report is in the tone of a kind of scream, and stultifies itself by its own violence. One is reminded of the warning given to Artemus Ward when he went south with his show: "The American eagle, sir, is screaming all over the length and breadth of this bright and beautiful land"; and one is almost tempted to adopt Artemus Ward's reply: "An' what's he screaming for? Don't his victuals sit well upon his stomach?" In this case they evidently do not.

The Usher Hall Competition.

The competition announced for the building at Edinburgh to be called the "Usher Hall" seems likely to be an important one. The cost of the building is to be £65,000; designs which the assessors judge to exceed that sum by £5,000 to be excluded. The premiums are on a liberal scale—£250, £150, and £100 for the second, third, and fourth designs respectively; the author of the design placed first to carry out the building. The assessors are Sir Aston Webb and Mr. Williamson, the city architect. It will undoubtedly be a most fairly conducted competition; but there are some considerations in regard to it which ought not to be overlooked. We gather from the published information in the "Scotsman" that the building is essentially a concert hall; whether it is contemplated to use it also for any other kind of entertainment does not appear; yet this is a very important point. If it is for a concert hall only, the floor ought not to be flat, but to rise to a certain extent from front to back; if it is to be available for other uses, of course the floor would have to be flat, but it would not in that case be so good for a concert-hall. It is rightly said that "acoustics are of great importance, and particulars should be given of the principles adopted to ensure a satisfactory result." But who is to decide on this point? The acoustics of buildings is far from being an exact science—perhaps never will be so; but something is known of it by those who have given experience and observation to the effect of music in differently constituted rooms. Then there is the question of the planning of the orchestra and organ. Most architects know nothing whatever about this. Some years ago, when there was a competition for enlarging and rearranging a large concert-room in a provincial town, the assessor selected a design in which the planning of organ and orchestra was about the worst possible for musical performance. Someone who knows something about orchestras ought to be consulted on this head. One of our principal concert-rooms is completely faulty in the arrangement of the orchestra and in the placing of the organ. Then, among further conditions, we read: "The building must be constructed in all vital parts of fire-resisting materials." What is meant by "vital parts"? Corridors and stairs, no doubt, can be so treated, but if "vital parts" is to include the main floor, it will be a failure as a music-room. Nothing but a wooden floor is good for a music-room, and it ought to have a space under it. Wood-block on concrete has not resonance enough. There is one other point on which we are certain all intending competitors will be agreed; the time allowed is much too short. The 9th of July is fixed. The problem set to competitors is a very elaborate and difficult one, and it cannot be properly considered and the drawings made in that time

TOWN PLANNING IN PARLIAMENT.

In the House of Commons, on the 19th inst., a series of questions were addressed to Mr. John Burns, President of the Local Government Board, by Mr. Boyton, with regard to the carrying out of the Housing, Town Planning, etc., Act of 1909.

Mr. Burns said the question of prescribing general provisions under Section 55 of the Act was receiving his consideration, but he did not contemplate the immediate prescription of such provisions. When issued they would be laid before Parliament. Six local authorities had been in communication with the Board with a view to the preparation of town planning schemes, but he did not think it desirable at this stage to make the names of these local authorities public. For the purpose of inquiries in relation to appeals under Sections 15, 17, 18, and 19 (relating to contracts by landlord closing orders, and demolition orders, and the redemption of annuities) as well as for other inquiries under the Housing Acts, the services of the staff of inspectors attached to the Department would be available. He had increased this staff by the appointment of three inspectors selected by himself from a long list of candidates, as specially qualified for this purpose, namely, Messrs. Clifton, Collin, and Leonard. Each of these gentlemen had had ample experience in connection with building construction. For the purposes of inquiries under Section 16 of the Housing Act of 1880, he had made an addition to the staff of medical inspectors by the appointment of Dr. Carnwath, who was formerly assistant medical officer of health to the Manchester Corporation, and who had had special experience in the administration of the Housing Acts.

The regulations under Section 56 of the Act of 1909, were to be issued at an early date.

Mr. Boyton asked whether, pending the publication of such regulations, a local authority, to whom plans had been submitted by an owner of land which was about to be developed for building purposes might decline to approve or might delay their decision as to their approval of such plans, in a case where the plans were in accordance with existing by-laws in force in that district.

Mr. Burns said the answer was in the negative, but if the local authority contemplated the making of a town-planning scheme in regard to land for the development of which plans as to new streets and buildings were submitted to them for approval, they would probably think it desirable to draw attention to the provision of Section 58 (2) of the Act.

Mr. Boyton asked whether all appeals relating to questions arising in London and the provinces under Sections 15, 17, 18, and 19 of The Housing Town Planning, etc., Act, 1909, would be dealt with by officials in London, or whether officials would be allocated to and would reside in or near the various districts or counties for the purpose of dealing with matters arising within their respective districts; and whether, either before or after the passing of the Act, any, and, if so, what, estimate was prepared of the probable increased expenditure payable out of local rates which would be incurred by local authorities in consequence of the administration by them of the Act in the administrative county of London, elsewhere in England and Wales, and in Scotland, respectively.

Mr. Burns replied that inquiries in regard to any matters arising under the Housing Acts would be held locally by such members of the staff of inspectors as might from time to time be found convenient, having regard to the general arrangements which were made for the purpose of local inquiries under the Public Health Acts and other Acts. As regards the latter part of the question, no estimate, so far as he was aware, had been or could be prepared of the additional expenditure, if any, which would be incurred by local authorities.

THE A.A. PLAY.

[*The annual play of the Architectural Association was this year "Arctia: A Legend of the Far North," written by Mr. Gervase Bailey, with music by Mr. Leonard Butler. It was produced at the Royal Court Theatre on the 18th and 19th inst. with great success.*]

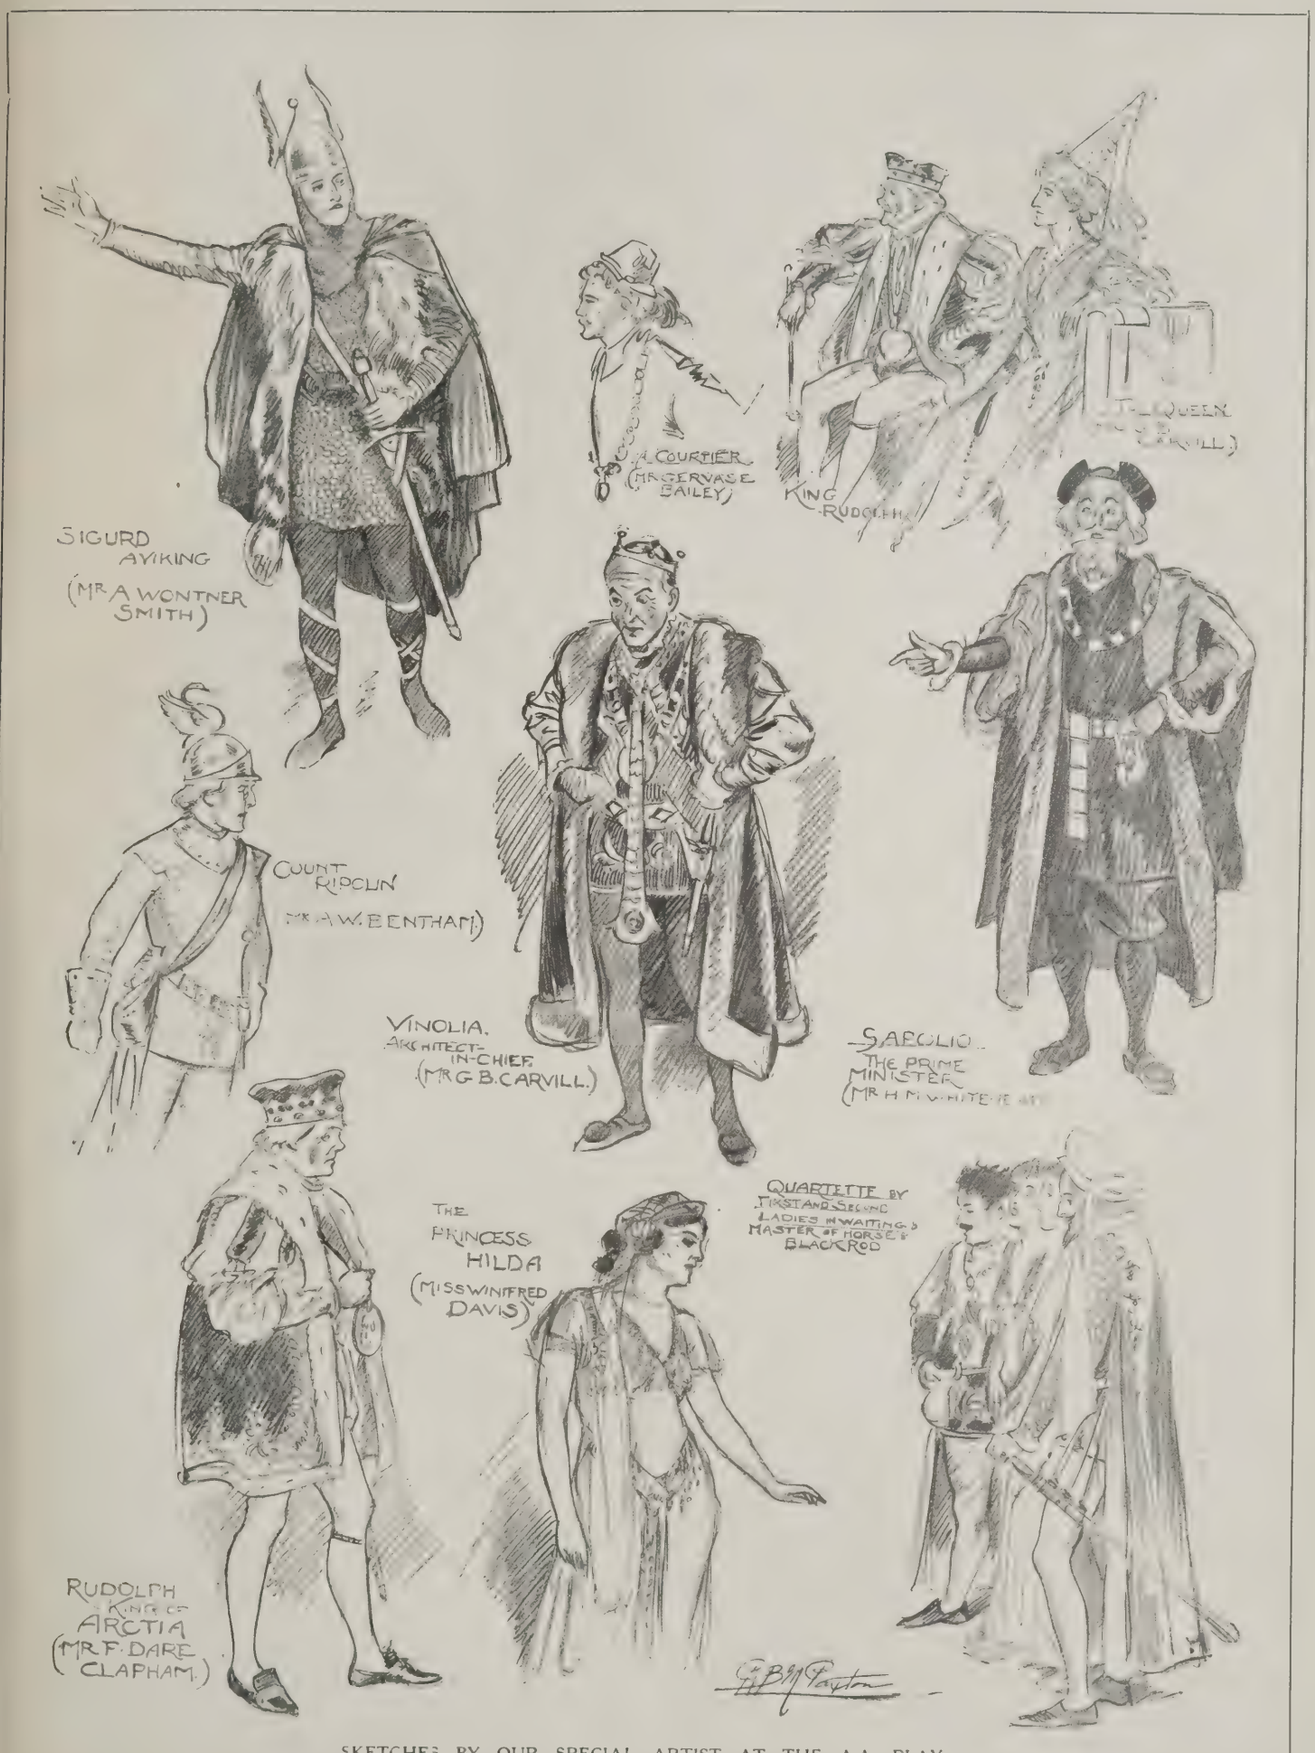
Remembering the heavy tax of last year's production, it was obvious wisdom on the part of the A.A. Players to take play less strenuously by reviving one of their old successes; and although "Arctia" was first produced, we believe, some eight years ago, the numerous topical quips and allusions were evidence of very thorough revision for the present revival. Yet so slight a plot on true love running unsmoothly retains some flavour of the musical comedy of eight years ago. Mr. Gervase Bailey finds his milieu in the old legend of a green land in the far north, where the sun shines and the flowers bloom all the year round. Arctia is the name given to this favoured spot, ringed round with an impassable barrier of ice mountains, over which the outer world has never advanced. The love interest necessitated the introduction, once more, of the fair sex, and the A.A. Players were assisted by many charming relations and acquaintances. These ladies of the Court of Arctia feel the disadvantages of their segregation. There are no nice men to marry; there has been so much intermarriage that the whole race is inter-related. Moreover, they feel convinced that their fashions have become positively prehistoric.

Deliverance, fortunately, is near at hand. Sigurd, a viking chieftain, with his friend Count Ripolin, arrive in the latter's airship; and, while the Count is detailing the story of their adventures, the Princess Hilda is deputed to show Sigurd the sights of Arctia. Sigurd finds no fairer sight than the Princess herself, and by the time they have returned from their tour the score, as Vinolia, the Chief Architect, observes, is "Two-love." Now, Rudolph, the King, in the words of Sapolio, the Prime Minister, is "a wobbler," with no particular desire except to find the North Pole. But his Queen is a very forcible lady, and having decided that her daughter is to marry Vinolia, she plots with the Architect to circumvent the lovers. Sigurd, Vinolia observes, "has declared hearts, presumably being weak in diamonds"; but the Queen declares that she holds the trumps, and will bring off a "grand slam." In the archives she discovers a law on immigration, which condemns to death the first alien crossing the boundaries of Arctia; and this unenviable distinction is held by Sigurd. Fortunately the Prime Minister keeps up his sleeve handy amendments to most of the Arctian laws, and he produces one which enables the venturesome immigrant to escape the death penalty by discovering the Northern Pole within twelve lunar months, in which event he is not merely secure from unhappy dispatch, but can claim the hand of the Princess in marriage. Accordingly, Sigurd sets sail in the airship to find the Pole, armed by the Princess with a magic staff which will indicate the position of the Pole by standing up without support when placed over it.

The twelve months have elapsed by the opening of the second act. Sigurd has not returned, and the Princess is once more condemned to matrimony with Vinolia. Preparations for the wedding have been made, the day has come, flags are flying, and bells are ringing. Into the middle of this festivity, Sigurd staggers, despairing and unsuccessful. He wonders at the general rejoicing, until suddenly the truth occurs to him, and he sinks overwhelmed on the steps of the Palace terrace. Here the Princess finds him, their troth is renewed, and they arrange to elope in the airship. But Vinolia, shadowing the Princess, overhears the plot, destroys the airship, and despatches a squad of troops to arrest the lovers when they enter the shed in which it is placed. So that later, as the wedding ceremony is about to commence, the two, as prisoners, are brought before the King. Sigurd welcomes his inevitable fate, but claims time to return the magic wand to the Princess, and, lo! as he kneels before her the staff straightens up in his hand, and remains without support, thus indicating the Pole, where, as the King says, "I never thought of looking for it." Thus the plotters are foiled and the lovers united.

Into this story Mr. Bailey has woven some clever repartee and several good songs. Vinolia gets the pick of the latter. From his first song we quote one verse:—

> In the days of competition,
> It was made the first condition
> That the Architect-in-Chief was to assess.
> With absolute discretion
> To announce in due succession
> Each competitor in order of success.
> But I found out to my pain,
> Plans would often cheques contain,
> Or a bank-note of a value past belief;
> So in order to checkmate them
> I resolved to confiscate them—
> 'Twas my duty as the Architect-in-Chief.
>
> Yes, in cases of commission,
> In a public competition,
> You must set an Architect to catch a thief;
> Like his Majesty's most implicated,
> Irritated, aggravated,
> Antiquated Architect-in-Chief.



His last song, to the prospective scholars of his newly founded Architectural College, is a parable on the A.A. itself. The last verse runs: —

> You shall make some full-size details—far too wonderful to use,
> Or trace a drainage block-plan which you'll paint in brilliant hues,
> Blue and pink, puppy, pink, pink, pink.
> And in time it is just possible, though not beyond a doubt,
> With care and with attention in three years or thereabout,
> You will suddenly discover you're beginning to find out,
> How to think, puppy, think, think, think.
> *Chorus*:—
> Drink, puppy drink,
> Let every puppy drink
> From the free-flowing fountain of knowledge;
> You shall learn your little duty
> To build in truth and beauty
> At the Royal Architectural College.

One does not require to look too closely into little points of detail; but it appeared to us as a rather unnecessary anachronism that a Viking Chieftain and a mediæval Count in chain armour should turn up together in an airship. It would have been more logical, considering the airship, to have made them and their followers modern men in modern dress; but we are not insensible to the fact that the *tout ensemble* would have been less picturesque, or that Messrs. Wontner Smith and Bentham would have been deprived of two good buccaneering songs.

Mr. Leonard Butler's music is melodious and delicate; his best number is perhaps the "Little Bird" duet of Sigurd and the Princess, quite the daintiest of all the songs. The setting of "Winds in the Night-Watch," sung by the Princess, and "There is One Hour," sung by Sigurd, are marked by considerable breadth and feeling. The quartette, too, in the second act must not be omitted from commendation.

Where all worked so ably for the general success consideration of the acting becomes somewhat invidious. Some of the principals had very little to do; Sigurd, for instance, had few opportunities, and for the greater part of the second act was absent from the stage altogether; and Mr. F. Dare Clapham had to work very hard to infuse life into the somewhat colourless part of the King. Mr. A. W. Bentham made a great deal of Count Ripolin. He played the part with just that dash of exaggeration and bravura which it required. To Mr. G. B. Carvill fell the part of the villain, the Architect-in-Chief, and he made him Machiavellian indeed; but we think his reading suffered at times by being taken too slowly. Mrs. Carvill played the shrewish Queen, and made the most of a small part. Miss Winifred Davis was a very beautiful and fascinating Princess, and her fine voice quickly captivated the audience. Messrs. H. M. Whitehead, W. O. Langbein, Alec Smithers, and Miss May Farnell gave ungrudging support in minor parts. Miss Dorothy Foster, a dainty Lady-in-Waiting, must be praised for her very graceful dancing. The chorus, in which the author figured, worked unflaggingly throughout.

NOTES AND NEWS.

The Late Lewis F. Day.

We hear with great regret of the death of Mr. Lewis F. Day, a decorative designer and critic of exceptional knowledge and good taste in his special subject. Himself a very able designer of ornament, he also possessed a remarkable faculty for analysing and explaining what may be called the philosophy of ornament, and of rendering such subjects really interesting and enlightening to the reader by means of numerous well-chosen and charming illustrations. In this respect his books on "The Anatomy of Pattern," and on "Nature and Ornament," serve the double purpose of promoting thought as to the meaning and application of ornament, and of educating the reader's taste by the study of numerous illustrations of the beauty of ornament. And Mr. Day's æsthetic perception as to right and wrong in decorative design was singularly sound and true. On questions of this kind it would hardly be too much to say that he was never in the wrong; his critical judgment could always be relied on.

The Licentiate R.I.B.A.

That the new class of practitioners to be admitted to the R.I.B.A. is not universally approved is evident from a letter we have received from an A.R.I.B.A. He says:—

"From the point of view of a country Associate, the action of the Institute in admitting architects as Licentiates does not appear a very wise one, nor fair to the Associates.

"Many Associates have studied hard and worked for years to pass the examinations of the R.I.B.A. They have also paid examination entrance fees, and they pay two guineas a year subscription. They are entitled to write A.R.I.B.A. after their names, and this is about the only advantage the country associates are able to derive from the Institute. It may be granted that it gives them in the eyes of the general public some standing in the profession.

"Licentiates are now to be admitted, without examination or election, probably on the most flimsy evidence as to their standing and ability. They will pay one guinea a year subscription, and will, I presume, be entitled to write L.R.I.B.A. after their names. From the rush there appears to be to obtain this distinction, one would gather that the failures in the profession, and those who have been too lazy or incompetent to pass the Associates' examinations, are seizing the opportunity.

"Do you think the general public will discriminate between A.R.I.B.A. and L.R.I.B.A.? I think not. That the incompetent failures in the profession should be placed, in the eyes of the public, on a level with Associates of the Institute appears very unfair.

"If the Institute wishes to gain the lasting gratitude and regard of the profession let them pass a Bill through Parliament that will prevent joiners, cabinet-makers, and undertakers calling themselves "architects." It does not appear likely that this end will be obtained more easily with the assistance of those now about to become 'Licentiates.'"

House Property Sold by Dutch Auction.

An experiment in the sale of house-property by Dutch auction, or "offer and acceptance," was attempted at the Mart, Tokenhouse Yard, last week, but the innovation does not appear to have met with much approval. Mr. Walter Hall, jun., who offered the property, explained that his chief reason for offering real estate upon a system that is usually associated with the fish market was the desire to discourage the tendency to withdrawals that besets the more usual method. The proportion of withdrawals, he said, is exceedingly high—something like ninety per cent. There is, it therefore appears, a growing custom of "withholding bids until after auction," and the effect of withdrawals is to depress unduly the prices of real estate.

THE LATE MR. LEWIS FOREMAN DAY.

Palace of French Industries for Aldwych.

At length there seems to be a reasonable prospect of the long-talked-of French building for the L.C.C. Aldwych site being realised. It is stated that designs have been passed by the L.C.C. for an imposing pile of buildings, to be called the Palace of French Industries. The site comprises 124,000 sq. ft., and stretches from the junction opposite the Gladstone statue as far as the lofty premises occupied by the Agent-General for Victoria on the Strand side. The architect is M. Ernest Gerard, with whom will be associated an eminent London architect. The main entrance to the Palace will be in Aldwych; and the Strand elevation will comprise five storeys, with, on the ground floor, about 100 shops, which will stand back from the footpath under a colonnade. The scheme includes a theatre to accommodate an audience of 1,500 to 2,000. The capital aimed at is £1,000,000.

Obituary.

We greatly regret to announce the untimely death of Mr. Lionel Gordon Detmar, who has been killed by a fall from his horse at Epsom. Educated at the Forests School, he served his articles with Mr. W. Hilton Nash, F.R.I.B.A., and, later, entered the offices of Mr. Gibson, F.R.I.B.A., and of Mr. John Belcher, R.A., subsequently joining Mr. W. Hilton Nash in partnership. On the last-named retiring from practice in 1905, he entered into partnership with Mr. Theodore Gregg, of 1a, St. Helens Place, E.C. He obtained a gold medal at the Institute of British Architects, became one of the youngest Associates in 1901, and obtained the Travelling Studentship of the Architectural Association in 1902. He was one of the three selected architects to design the British section at the Franco-British Exhibition of 1908, and the Palace of French Applied Arts remains to-day as an honourable record of that appointment. He carried out a good deal of domestic work; the London City and Midland Banks at Putney, Notting Hill, and Willesden, together with the façade to the New Skating Rink at Maida Vale, show the Renaissance influence running through all his work. At the time of his sudden and tragic death he was engaged on an extensive work on the design of Banks, English and foreign, illustrated by his own sketches. The profession has lost a brilliant and promising member, and those who knew him will greatly miss his personal charm.

THE ARCHITECTURE OF ADVENTURE.

By PROF. W. R. LETHABY, F.R.I.B.A.

[In this paper, which was read before the Royal Institute of British Architects on Monday, April 18th, Professor Lethaby enters upon an investigation of some of the principles that underlie the architectural design of various periods and countries. His main thesis is that "when the higher architecture has appeared in the world, it has come as the result of spontaneous interaction of the arts: the architect has wrought according to custom, need, and demand, and sculptors, painters, and the rest have done the same. The resulting unity was not imposed by an architect's artistic ideal, but because all expressed their thought in a common current language." This thesis he elaborates by an examination of historical data, and incidentally he evolves a theory of originality in architecture —of the architecture of adventure.]

Living Force and Active Principle.

By the architecture of adventure, the author means the living force and active principle of all architecture—the spirit of experiment in building. "Architecture" is only "building" written in Latin; but architecture is building enhanced by sculpture and painting, and then stands to building as opera stands to music. But, in any case, mere needful and experimental building is the main substance, force, and origin of the art.

Building that deals with known traditional needs should be customary; to meet changing conditions and ideals it must be experimental. For the former, practical craft education may suffice; but how to meet changing needs is an urgent question. Here, to continue in old ways or revert to past types is impossible. The one thing essential to development is a basis of some general agreement over a long space of time. A school of art is only generated by intensity, the heat of common pressure.

National Predilection.

Proportion properly means what it meant to the Greeks—a definite prearranged relation of measured quantities. Greek artists sought perfection in proportion. The Romans desired bigness and splendour. The Arabs loved bright colours. There is no one and perfect school; there are an infinitude of conceivable perfections. Any strong and general interest in building, felt by a people, will produce a living school of art. With all the variables there is one constant—the *building* interest, the delight in experimental structure, the adventure into the unknown.

The Greek architects seem nearly always to have been engineers. Daedalus, the legendary craft-master, was a mechanician; Callicrates, builder of the Parthenon, also built the fortification called the Long Walls. Hippodamus fortified the Piræus, and was an expert in town planning; and Archimedes himself was counted among the seven great Greek architects. Most of the Roman architects seem to have been engineers. Even Vitruvius was official keeper of war-engines. So in the Byzantine period, Anthemius, the architect of Santa Sophia, was an inventor of machines, and was a highly skilled mathematician, and his associate Isidorus was a skilled mechanic; and Isidorus the Younger, who re-erected the dome after its fall, had constructed fortifications. So it was also in the Middle Ages.

Phenomena and Principles.

Leonardo da Vinci, in whom the spirit of the Renaissance was most completely manifested, was interested always in phenomena and principles. He was a pioneer in town planning as well as in aviation. He was the first to enter on a systematic enquiry as to the mechanics of architecture. The only other artist of the Renaissance who caught the idea of investigating principles—the scientific spirit—was Dürer, in whose MSS. are studies for domes of parabolic section.

Wren, while not a world-genius, like Leonardo, was the one architect we have whose formal thought matters—"I say 'formal' as opposed to the flashes of insight of a dozen men like Pugin." Wren's was a great intellect, most highly trained in all the science and philosophy of an ample age. He was a powerful original genius. He and his friend Robert Hook, another scientific architect, were conversant with the general law of gravitation before Newton brought it to proof. Wren was almost certainly the first in England to apply the methods of scientific investigation to the laws of structure, and Hook is said to have been the first who stated the mechanical properties of the arch. We are fortunate in possessing records, however slight, of Wren's systematic thought on architecture, and the teaching of such a man on his chosen art should have great value and weight, but has been strangely neglected. He knew that the real basis of architecture was necessity, law, geometry. He tells us that he designed the beautiful saucer domes of St. Paul's by borrowing them from Santa Sophia because they were the most mechanically perfect that he could find. Wren was probably the first architect to see that necessity, which he equates with nature, must be one of beauty.

Meaning and Content of Architecture.

The author deduced from his data that the living central stem of architecture has always been rooted in the spirit of active experiment and adventure for the further satisfaction of needs and desires. Two views as to the meaning and content of architecture have been held—(1) That there is a *thing*, Architecture—perhaps revealed in the one perfect form of classical art, or manifested more or less in different forms in divers times, as Greek and Gothic architecture. Further, it is to be attained by a special sense in the artist. (2) That the essence of architecture is proportion, the discovery and use of definite ratios, and that by this method of proportion an absolute architecture may be embodied. There is a third view—that architecture is primarily building according to the natural laws of structure and stability, according to need and order, and always with care and finish: that it must ever vary with ever-changing conditions, and that this ordinary building may have associated with it painted stories and sculptured stories, or inlays and fretted works and gildings, while the essential architecture is still structure, and the method of growth is by continuous experiment in the possibilities of structure. The author must not be thought to urge any quest of originality; all search for it blocks the way to any possibility of realising a true originality, which properly is of the root, not of the appearance. True originality is to be found by those who, standing on the limits of the sphere of the known, reach out naturally to some apprehension and understanding of what is beyond; it is the next step in an orderly development. The author urged concentration on practical, experimental, and scientific education. "What we most need at the present time is the accumulation of power; we want high mechanical training, wide practical experience, and great geometry. And then we want to cover the field by a systematic research into possibilities. The possibilities of walls and vaults, and of relation between the walls and the cell, and between one cell and another, want investigating, as Lord Kelvin investigated the geometry of crystalline structures and the packing of cells. Such a training would not, it is true, include the whole of architecture, but it would open the way to the best we can attain. We might hope thus to give up hugging the coasts of the known, to sail boldly forth under the stars. Thus, and thus only for us, may we enter again upon the architecture of adventure."

The Romantic Brick Kiln.

Of course "imaginative reasoning" is wanted. One finds it in the Forth Bridge; some brick-kilns have the beauty of Byzantine churches; and "the most romantic modern buildings I know are the oast-houses of Kent." When poetry and magic are in the people and in the age they will appear in their arts; but it is not the least good to say, "Let us build magic buildings. Let us be poetic." We should devote the whole of next session to papers on constructive science—get Prof. Karl Pearson to give us the result of his researches on the arch; Prof. Perry to draw up a report on the application of mathematical enquiry to structures, and Mr. Dunn to lecture us on modern constructive problems. Pugin students should be made to analyse varieties of mediæval vaults, Soane students varieties of staircase arrangement, Tites should be sent to study French railway stations, Grissells to work at German hotels, and Godwins to American hospitals. We need first the natural, the obvious, and, if it will not offend, the reasonable; so that to these, which might seem to be under our own control, may be added we know not how or what of gifts and graces. Thus may we hope to combine and reconcile again the two realities, the reality of natural necessity and common experience, and the reality of the philosophers, which is the ideal.

DISCUSSION.

The President, Mr. Ernest George, commented upon the profound wisdom contained in Professor Lethaby's paper, and observed that a good end would be served if they could eliminate from their minds the purely superficial ideas nearest to hand.

Professor Beresford Pite proposed a vote of thanks, and remarked upon the prevailing habit of loading the architectural student with information relative to old styles; he hoped that the paper would help to dissociate this idea from modern architectural education. Archæology, however, helped to a vivid realisation of ancient methods, and should form valuable subject matter for examination. They knew that Wren was a great mathematician and pre-eminently a man of science; but he breathed life and liberty into the Classic style. He (the

speaker) suggested that there must be always a parallel to the scientific side of a character; not the parallel of the monorail, but what might be termed a stream of artistic sympathy, always united with the scientific bent. Thus they would find Leonardo, who, mathematician that he was, could paint the "Last Supper." It was, however, extremely difficult to argue from the outstanding geniuses. If the architectural student was to be trained on the recommendations of Lord Kelvin, he (the speaker) would renounce architecture and take to sketching. He believed that the factor of intercolumniation in a Greek temple, gauging as it did the capacity of marble to hear from point to point, crystallised the whole problem. The reinforced concrete beam, although perhaps in effect the same, dismissed all charm. Engineering works had always impressed him more than any other class of modern building. The whole sense of a deep cutting, a high viaduct, was enormously impressive. One gazed at the Forth Bridge with wonder, and speculated; but the world as at present constituted would not stop there. Should they let it stop there? All the static facts were arrived at and achieved. Knowledge of brickwork requisite for architectural practice was obviously acquired. They had got as far as they need. What should they do next? The only thing was to wait and hope—to try to cast their eyes forward and take an interest in what was before. In the meantime they were the children of the Renaissance. Ever since the Renaissance had put the clock back, science had come forward and despised the past, just as architecture had gone back and despised the future.

Mr. H. H. Statham said he had great pleasure in seconding the vote of thanks for a very remarkable paper. Touching first on one or two details, he did not think that Wren designed the second storey of the nave of St. Paul's for any reason other than formal architecture. It was not necessary to assist the abutment, though it might be so near the dome. He could not call the cone a parabola; the lines of a parabola were not straight, however far produced. The most important sentence in the paper was that to the effect that a strong and general interest in building would be likely to produce a living architecture at any time. That was what we most wanted. That building and the interest in it was a *constant* he quite agreed, but might there not be a "constant" beyond that—adventure in design as well as in construction? Mediæval castles were no doubt pure engineering, however we thought them picturesque now, but he could not agree that the cathedrals were no more than that. He would suggest that architecture was the poetry of plan and section. If all the mosaics and marble were taken out of Santa Sophia, it would still be great architecture. Walter Pater, in one of his essays, said of the architect, "He closes his sadness over him, or wanders in the perplexed intricacies of things, or projects his purpose from him clean-cut and sincere, or bares himself to the sunlight." That was a recognition of abstract architecture as a form of spiritual expression. Nevertheless, he thought Professor Lethaby's idea of adventure in structure a very good one, provided it were considered as the ground-work of adventure in design. The one grew out of the other.

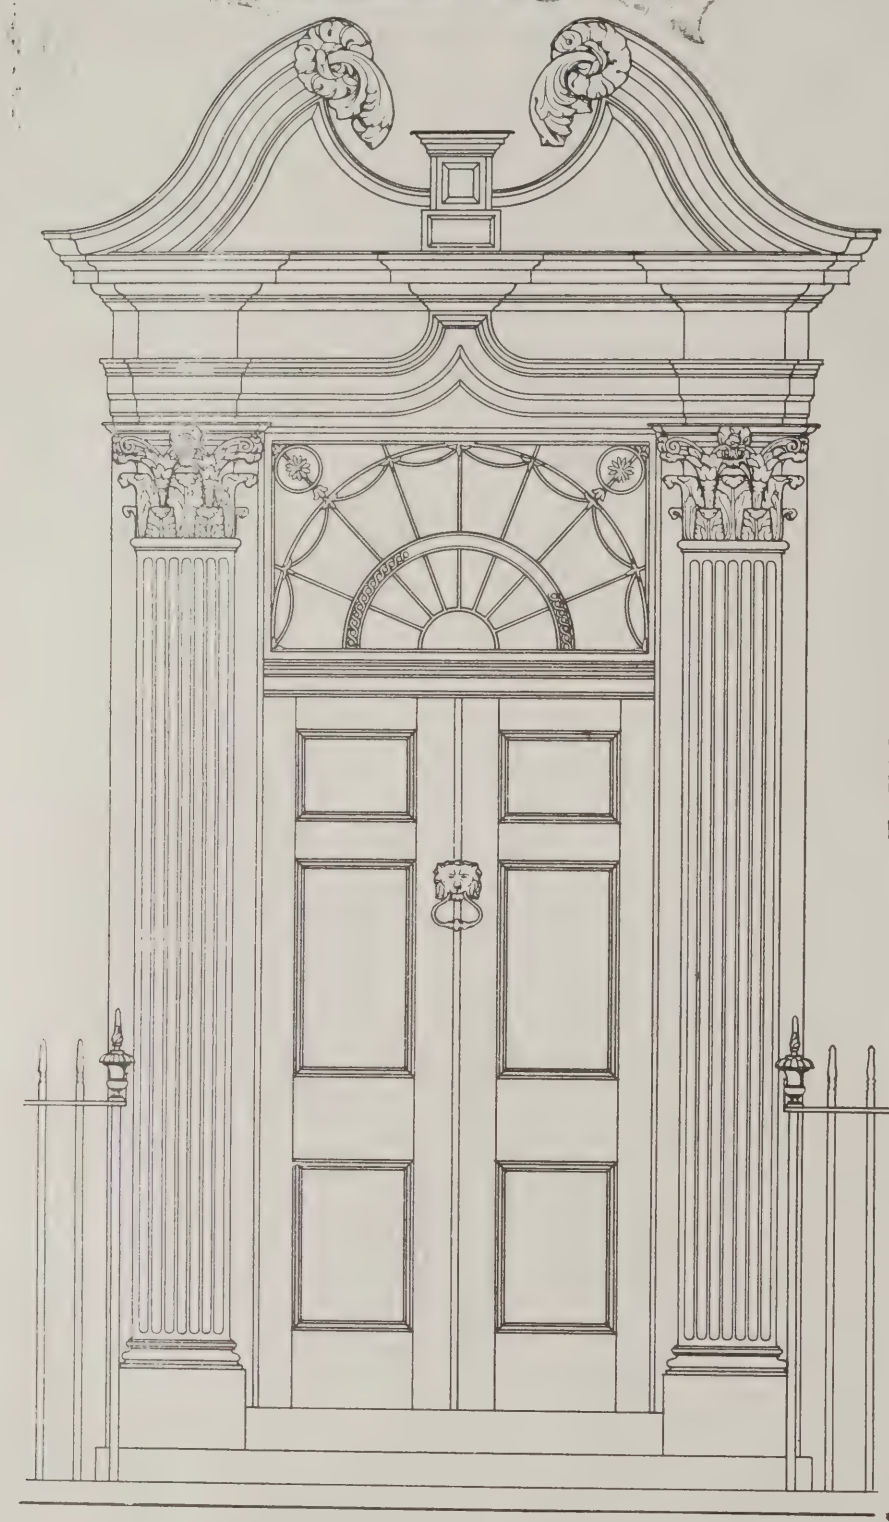
Mr. Paul Waterhouse said they had had a wonderful insight into the higher aspects of architecture. He could not bear to think of the architectural student with his study of old work in any way remitted. He did not know what Morris meant by his statement with regard to the Renaissance, "the past slew the present." The Renaissance was not looking back, but surely taking the blood out of the past ages and inspiring oneself with its vigour.

Mr. R. Weir Schultz observed that some speakers seemed to think if they studied architecture on a scientific and structural basis they would lose all sense of beauty. Was not Gothic the romance of construction? Was not the whole idea of construction, the endeavour to see to what limits it was possible to go? And was not the mark occasionally overshot with disastrous results? They heard a great deal about the wonderful beauty of our domestic architecture. What did it amount to? They had simple pieces of building done in a simple local way. There was no question of plans and details. Modern domestic architecture only approximated to this.

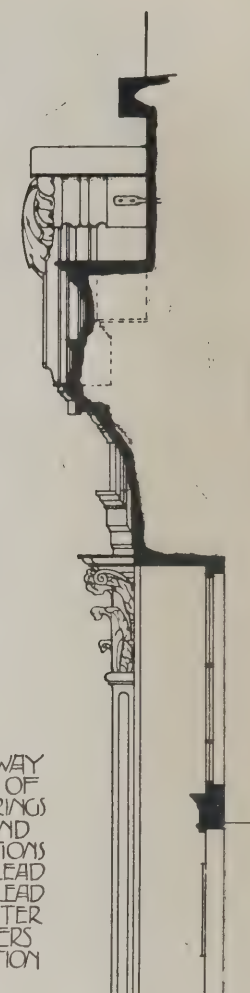
The Lecturer Professor Lethaby, in reply, said he agreed with all the things that had been said. He had in mind two main points: first, method of design to the modern mind; the second he forgot. It struck him that nowadays they were dealing with a multitude of what might be called "flavours." They were trying to imitate, to design things that *looked* like cottages, or *looked* like farmhouses. The circumstances reminded him of a sign that had once appeared in a window: "Fine jam—good strawberry flavour." It was not the flavour they wanted, but good sound jam.

OBITER DICTA.

The English Hedge. If one were asked to name on the spur of the moment the most characteristic feature of the English landscape, there can be little doubt that he would reply—the hedge. It is a peculiarly English institution. Picked up and dropped blindfold into any corner of the isle, you would know, directly your eyes could see, that it was your own land by the hedges. In other countries people put up fences, ditches, banks, railings, what not; but they are by no means the same thing. A hedge implies care in construction, care in preservation, and the careful work of some immemorial ancestor. —"*Spectator.*"

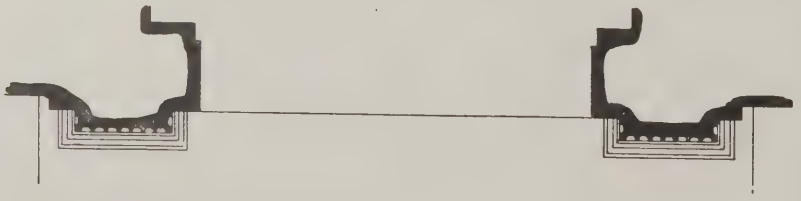


A Living School of Art. I want to be clear about this: that proportion properly means what it meant to the Greeks, a definite prearranged relation of measured quantities. This view is perhaps most clearly brought out in the case of sculpture, to which they naturally came to apply similar schemes of harmonic measures. Polyclitus, the contemporary and equal of Pheidias, wrote a book on the subject, called "The Canon," and made a celebrated statue to illustrate it. The head was one-seventh of the total height, and all the other parts had definite ratios. Moreover, a saying of his is preserved: "Success in art is attained by exactness in a multitude of arithmetical proportions." Greek artists all agreed to such a theory—that is, they set about discovering perfection, and we know what wonders they accomplished in consequence. The Romans as certainly agreed in a desire for bigness and splendour, and they, too, succeeded according to their desires. The Arab builders fell into a love of bright colours, baked into shining tiles, and this, too, gave a character to *their* art. Any strong and general interest in building, felt by a people, will produce a living school of art. There is no one perfect school; there are an infinitude of conceivable perfections. With all these variables, however, there has been one constant, the *building* interest; the delight in experimental structure, the adventure into the unknown.—*Professor W. R. Lethaby, F.R.I.B.A., in a paper read before the R.I.B.A. on April 18th.*



Architecture Racy of the Soil. There is no country in the world where the development of the arts can be so continuously traced as in Egypt. Egypt is the archæologists' land of promise. In a land where rain and frost are seldom known, and the sand is ever at hand to cover and preserve, the monuments of men perish only by the hand of men. Hence it is that the history of Egyptian architecture, sculpture, and pottery can be followed from the beginning of the historical period down to the present day. . . In architecture, the windowless wall of the house or temple was due to the abundance of light, and the blank wall became in consequence a picture-book on which the scenes of this life and the next were represented in sculpture or painting. The lotus of the Nile, again, became a favourite motif, with the builder; the capitals of his columns were shaped into likenesses of the flower, and its leaves were modelled on the blank spaces of the walls. Egyptian architure, like most other branches of Egyptian art, was essentially a product of the Egyptian soil.—"*Saturday Review.*"

Bricks Without Clay. Dealing with the characteristics of a perfect brick the lecturer objected to the use of the term "clay," and preferred "brick-making earth," which should constitute half the material used; the remainder consisting of alumina and silica. There were very many varieties of brick earths, and the selection of a suitable material required great care and a considerable practical acquaintance with geology, chemistry, and physics. Many opportunities had been overlooked in the past, and were still being overlooked, because the persons interested lacked this knowledge.—*Mr. A. B. Searle, at the Roya Society of Arts.*



Inartistic Uniformity. Certain artistic souls have had their susceptibilities outraged by the higgledy-piggledy nature of the buildings erected on allotments. For our part we candidly confess that we have been more inclined to admire the ingenuity displayed in making use of most unlikely-looking materials than to deplore lapses from a high standard of architectural art. The authorities, however, propose to institute a standard or model hut which all allotment-holders must copy. We do not believe in uniformity. A group of allotments dotted with huts all of the same shape, size, and colour, would be hideous. Indeed, we would prefer the "glorified bacon boxes" of to-day.—"*Sheffield Daily Telegraph.*"

MEASURED AND DRAWN BY EDWIN GUNN, A.R.I.B.A.

This house is a fine old Georgian town house, now used as offices. It contains a richly treated open newel stair of imposing dimensions, rising through three storeys, and other details of interest beside the doorway shown above. In regard to this the vacant central pedestal of the pediment no doubt once bore a shield or emblem, and the general design seems to emphasise this point. The iron railings appear to be original, but the double margin door and delicate lead fanlight are obviously of later date.

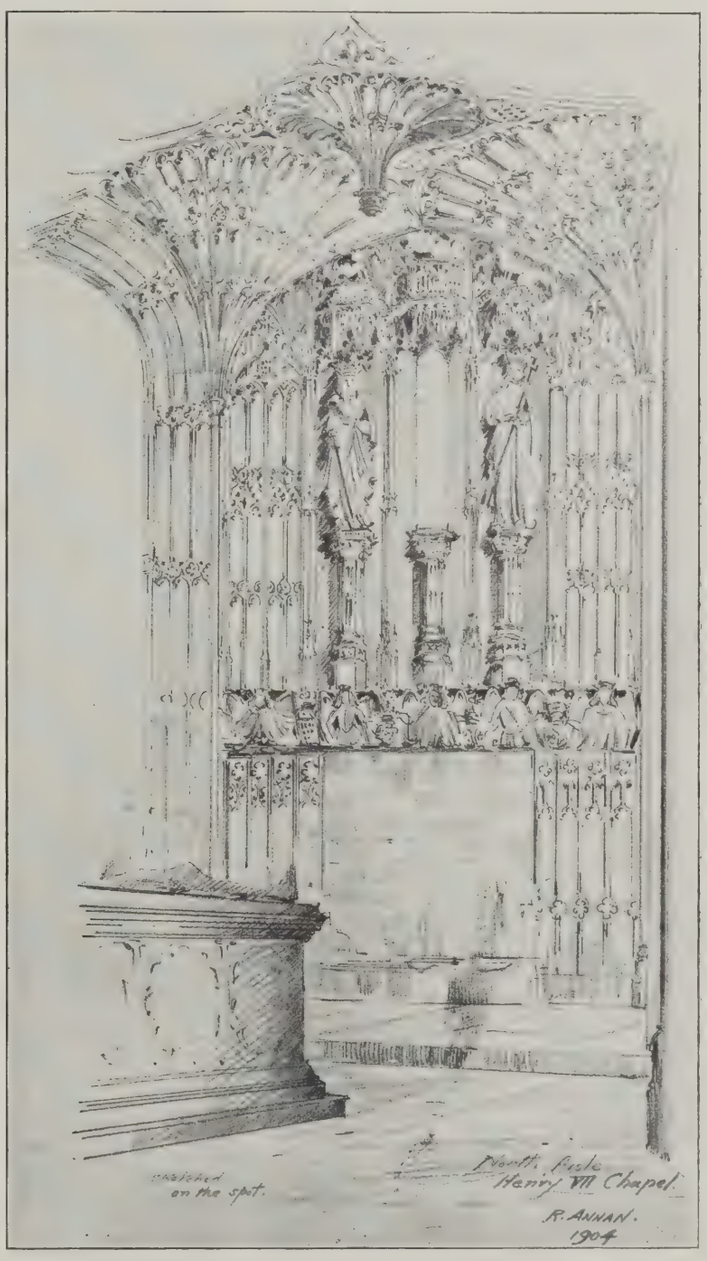
SCULPTURE AND ARCHITECTURE.

[This report of the American Institute of Architects' Committee on Allied Arts was presented to the Institute at the recent annual Convention. The Committee consisted of Messrs. Irving K. Pond (Chicago), chairman, H. Langford Warren (Boston), Howard V. D. Shaw (Chicago), Edward G. Garden (St. Louis), and Charles Z. Klander (Philadelphia). The report, which is intended to deal mainly with sculpture as applied to architecture, is largely an indictment of modern life and social conditions as affecting architecture and the allied arts. This slashing attack on accepted ideals and conventions makes stimulating reading; but such savage iconoclasm makes one doubt whether the report is not conceived pour faire rire].

Sculpture is singled out in this report because of all the allied arts sculpture is most intimately related to architecture; for sculpture and architecture are arts dealing primarily with form, especially with form as giving character to mass. The architect thinks first in terms of homogeneous and rhythmically composed mass. Colour as affecting the allied arts and the arts of design and applied as architectural decoration or as mural painting does not intimately affect the structure. Colour is really architectural only when as a property of the material of the mass it serves by its qualities, and as adding value to light and shade, to modify general proportions. A closer study of the relations of art, and especially of the art of architecture, to the life of the people is made in this report, that a clear conception of the status of architecture having been established, further studies dealing in detail with the allied arts may have a carefully surveyed field in which to erect their premises.

The intimacy of the domestic arts and even of the arts of design with the characteristics of a people is pretty generally conceded, and in a measure understood; but the monumental arts seem to be conceived as outside—perhaps above—as of another realm. This is not so, however greatly certain workers in these nobler arts may desire, or seem to force, such conclusion. The further any art withdraws itself from the highest in the life of its day, the less effective will be that art in ministering to the particular needs of the time; the less exalted will be its place in history. These particular needs include the needs of the mind, spirit, and heart. Whether in the greater or lesser periods, it is only as one of these factors has been more highly esteemed and more fully developed or has more powerfully influenced the life of the time than have the others, that architecture has taken on its characteristic aspects. The architecture of an age in which no one of these factors is supremely dominant yet which forces one or another of these characteristics will be viewed with but ephemeral appreciation, certainly not with lasting respect.



A period of existence is not a pin prick in a dotted line, but is an integral increment in the ascending spiral, and an age finds itself only by relating itself to all that has passed.

To comprehend the status of an art, then, it is necessary to study broadly life and its expression, to view sympathetically that interplay of motive and action which produces the civilization of a period and differentiates that period from another, and to note, if not how, at least that the spirit of a civilisation determines the form of the state and at the same time dictates the manner of the art. To comprehend, therefore, the status of architecture, it is necessary to understand the nature of society and the state and to appreciate that the spirit which produced society and which dictated the form of the state dictated also the forms of architecture, and that without the guidance of that spirit no worthy enduring architecture was produced.

There seems to be an existing idea that through all the periods man was a fixed star and that styles changed; that throughout the evolution from Egyptian to Greek, from Greek to Roman, from Roman to Romanesque, from Romanesque to Gothic, and then to the Renaissance, man was stable, his product alone changing. This is a most erroneous idea, for while the external form of man's body held, his motive and action changed. He was spiritual in this period, intellectual in that, temperamental in another, and true to his animal instincts only in them all. Through most of them he showed signs of intelligence.

The Spirits of the Ages

Glance hastily at certain of the sharply differentiated historical periods, and note the forms of government and of architecture and the racial characteristics: Egypt—with its philosophy of immortality; imbued with a zest of life and a poetical love of Nature; governed by kings whose will was served by slaves, native and alien; symbolic in its expression of philosophy and art and in all its deeper thought; the great pylons and ranged piers of its architecture, almost too massive for columns, wrought in forms symbolic of terrestrial life, over and above which rested the indestructible canopy of heaven, glistening with stars; heart and sentiment for inde-

THE NORTH AISLE, CHAPEL OF HENRY VII., WESTMINSTER ABBEY. SKETCHED ON THE SPOT BY R. ANNAN.

structible beauty everywhere; garb and ceremonials all in consonance. Greece—with a government of changing form but never by the people, although the term "democracy" was used; now a king, now a tyrant, now an oligarchy, never a true republic; an industrialism based on slavery; a unified religious and social philosophy; an intellectual vitality, potent in its logic and definite in its conclusions; a love for Nature only as Nature could minister to the conventional in literature and art and to a religion which was little but literature and art; a great borrower but transmuting alien facts and forms to the likeness of its own unified and æsthetic spirit. The Arabian—daring, poetical, picturesque, unstable, acting on impulse, careless of life; its art fleeting of form and of colour; its religion definite and appealing; touched now and again with the fatalistic philosophy of the Orient, and using the dome to crown the tomb and indicate the finality of all things. The Middle Ages—ascetic, spiritual, giving life and Nature a new and higher meaning; aspiring, poetic; the intellect not overworked, perhaps, but the heart filled and the spirit overflowing. And then, and purposely misplaced as to chronological order—Rome, the imperial—powerful, forceful, dominant, domineering—arms, conquest, spoils, greed, slavery; intellectuality not at a premium, spirit and heart below par; the people slaves to the court, the court slaves to power and passion. Imperial Rome pulled down the results of other civilisations or pulled them up by the roots and transplanted, manipulated, applied, or discarded them; but as imperial Rome was not an empire of the heart; knew naught of altruism; was not an empire of the spirit, knew naught of faith, was not an empire of the intellect, cared naught for logic; but was temperamental and of the body, in conception and in external expression its architecture naturally was not an expression of sincere motive or of logical achievement, but was a superficial application, clothing ofttimes in alluring and impressive garb the massive and bulky expression of a dominant will.

Then the Renaissance—the revival of learning and the forgetting of faith; when people learned the old pieces and spoke them prettily; tried to think like Greeks but could not dress like them, debased the ideal and glorified the idea. The Renaissance was quite as cultured and nearly as learned or knowing as is the Present. The Present—a period of knowledge even to the verge of sophistication! It is questionable if in an age of sophistication any form of sincere art can arise. The art itself will be sophisticated and the thread of sincerity will be snapped. Is not the Present an age of sophistication? Does not the age know overmuch and feel but feebly? Because of its learning and because of its lack of power to feel, this age is imitative, rather than initiative, in art. It would be an age of imitation in science and in philanthropy and reform but that having no precedent to follow in these lines it is forced into new fields and so the age is constructively altruistic while artistically it is imitative. To-day there is an altriusm. We do not conquer to make slaves, but to free them.

The Emulation of Rome.

Then why do we, especially we English-speaking peoples, strive, against the current, to emulate Rome? Is it because we, in America, by our legislation, by our industrial and commercial systems are making a race of industrial slaves and political underlings, that the hard and domineering spirit of Rome forces itself into our commercial architecture, into railway terminals, banking institutions, department stores and warehouses, into our courthouses and government buildings? Perhaps the charitable interpretation is that, lacking in sincerity and sentiment, we must clothe our spiritual weakness in an expression of physical force and mental overpower. That is human nature. When we cannot sway by ideas, by mentality, or by sympathy, we bully by the display of force or power. The church furnishes a concrete example of this. Its grip on the hearts of the people was lost when the spirituality, the aspiration, the mysticism, the ideality of the Middle Ages died out, and it could hold its power over the masses only by essaying the functions of the State. Then the religious structures of the North gave way to buildings which, like St. Peter's in Rome and St. Paul's in London, embodied the domineering governmental type, the one in a grand manner, as became the direct heirs of imperial Rome, the other in a half-hearted way as must be when state and church or a state church attempts to domineer over a race in whose veins runs the red blood of personal liberty and whose pulses beat to the time of the Magna Charta. The restraints of tradition are hard to throw off, and the social and political life of England as expressed in its real democracy and its constitutional monarchy is clearly echoed in its architecture, its half-hearted and lifeless governmental forms harking back to the Roman Empire and its beautiful homes telling of the life of to-day.

We here in America are not bearing the burden of empire. We are not saddled with a monarchy. We are a people ruled by a people (in our minds) and we are untrue to our environment, to our birthright, when we allow our architectural ideal to be expressed in imperial terms or in terms, indeed, of any other life or civilisation than our own. We may make mistakes in our attempts to find ourselves, but such mistakes cannot sum themselves up in so grand a mistake as the huge joke we are perpetrating in our governmental and domestic art.

It is, as already noted, only when a period is vitalised by the potency of at least some one great factor of existence that a characteristic art can arise. As for our nation to-day, have we a vital religion which touches the hearts of the masses? Have we a philosophy of life on which the savants are agreed and with which the people sympathise? Have we a commercial life free from the taint of selfishness—altruistic, broad, and liberal? Have we an industrialism which will make men free and not slaves? Have we a domestic life which is pure, where marriage vows are not violated, and sanctity reigns, where one household does not seek to impress another and the whole community with the sense of its wealth, power, and social station? Have we a Government of the people, for the people, and by the people, presided over by officials who will not tax the many for the benefit of the few? Have we a Government free from the suspicion of increasingly imperialistic tendencies? If we have all this, we are ripe for a great characteristic architecture which shall hold its own in the halls of history. If we have any of these factors fully developed, we are ripe for an individual and vital architectural expression along that line. Have we all this, or any of it? It seems, rather, that we are a lot of negatively charged individualists rattling around in a universe of positive ideas, unattractive and unattracted, and unified socially and artistically only as we are self-hypnotised by intently gazing on that brilliant spot, the focalised spirit of domineering Rome.

The Canker of Rome.

As witness, only one sect in all our religious bodies (and the exalted position of that sect based, in the popular mind, on its social prestige) consistently builds church edifices radiating humility and sincerity and aspiration; the Roman and Christian Science sects, pre-eminently the two which govern by threat and wield the power of excommunication, the two which dictate the mental range of their communicants, which permit this reading and place a ban on that—these two churches build in an avowedly Roman type when the style can be formulated at all. The theatre, expressing the domination of the trust, is clothing itself now uniformly in the garb of the Empire. The Government has virtually adopted the style of imperial Rome for its type and its chief executive is housed behind a washed-out reflection of it. The States—witness the procession of pitiable State houses—have aped the General Government, and the municipalities have taken their cue from the State; the county courthouses and jails have followed. What was good enough for the jail was good enough for the judge, and he dwells in a Romanised Greek temple; and so with squires, landed proprietors, professional men, captains of industry and artisans, till the Roman temple blisters the surface of the land, and worse, has gnawed into the brain of the people.

Insincerity of Modern Life and Building.

How deeply the canker has eaten can well be realised by contemplating the equanimity with which the public has accepted the insincerity and intellectual prostitution manifested in certain commercial and municipal buildings of monumental type. Modern science and ingenuity have given the age a system in the steel construction whereby it is possible to state the architectural problem frankly and solve it with that simplicity and sincerity which make for beauty. But, that the power of empire and the vulgarity and ostentation of misapplied wealth may be enforced, the skeleton has been distorted and the ideal debased. The age artistically is imitative and of the lowest forms. The age is not sincere, but is theatrical in the most puerile sense. We strut about like so many supernumeraries in the garb of Roman soldiers because we are spiritually and intellectually incapable of conceiving and acting the higher and better part. It may not be our fault, but it is our misfortune. It is not the less our misfortune that we of the very Present, being unable physically and mentally to wear the nobler Roman garb, are turning to its more debased forms and are taking our cue from the period of the "periwig and pigtail" which produced the Rococo style of the Renaissance—the character of that period was reflected in its people and in its art! And to-day, when our women, gowned via Paris, crown themselves with domes of false and foolish hair, surmounting all by chopping bowl and peach basket headgear, our architectural creations are reflecting the same spirit, and, Franco-Roman—where once they were frankly Roman—are crowned with monstrously designed and illy proportioned mansard roofs. The individual who assists in this degradation of taste may well take refuge under the protecting wing of the spirit of the age.

Sculpture is taken up in this report because it is, by nature and intention, the allied art most intimately related to architecture—by nature and intention, be it

There are six of these life-size figures in stone on the facade to the Place Boïeldieu. They come below the main cornice of the building, and are the work of Michel, Allan, and Peynot.

CARYATIDES ON THE OPERA COMIQUE, PARIS. LOUIS BERNIER, ARCHITECT.

noted, not by art and practice. Outside the realm of strictly architectural decoration, sculpture is as remote from true architecture as is mural painting. Rather than glorifying the structure it tends to belittle it. It makes of architecture only a background or pedestal. Architecture becomes a mantelpiece on which are displayed to some advantage to themselves objects of sculptural bric-a-brac. It matters not that the objects be arranged in such manner as to illustrate pictorially some notable event or to symbolise some noble idea. It matters not that the objects be so composed as to conform to the mass of the pedestal. That does not make them an integral part of the chimneypiece any more than posing the figures in the tympana—prone, crouching, sitting, stooping, standing, to make the composition conform to the rake of the pediment—makes them architecture. That was about as near to architectural sculpture as the Greeks or Romans ever came. The only architectural sculpture about the chimneypiece is the caryatid, and as the caryatid has been used in history it has been rather as an architectural fancy than as an architectural fact. The beautiful caryatides of the Erechtheum are imitations of columns, the fluting being carried into the draperies, the pillow blocks being carved into capitals Yet however gracefully these maidens may bear the superimposed conditions, however serenely they may smile at their burden, this is philosophy and not architecture, for the neck of the column is never subjected to the bending strain that tasks the necks of more than one of these maidens. In other instances of the Greek use of the caryatid the evidence of strain is thought to be removed by the intervention of the flower basket capital, the distinctive feature of the Corinthian style. This is not logical nor is it good philosophy nor good architectural art, for art does not seek to deny the stress and strain, but it recognises the conditions and meets them with graceful yielding or frank resistance, as the case may be. In the field of sculpture, imperial Rome with its over-elaboration of ornament is dictating to the Present. Our limit in architectural sculpture is reached with the filled pediment and the free standing statue superimposed upon a free standing or engaged column. Is this really our artistic and intellectual limit? Those who have hoped for a future in architecture and in sculpture do not think so. This existing limitation may be due mostly to unimaginativeness and lack of suggestive initiative on the part of the architect; in a lesser degree to the lack of intelligent understanding between sculptor and architect as to the function of sculpture, and in some measure to the attitude of the sculptor whose desire seems to be to create easel pictures and so dispose them that they may be the centre of attraction. The sculptor is willing for a consideration to place his product upon the architectural pedestal, well knowing that his work will not suffer eclipse and that great critical praise will be accorded him if his work is "architectonic." That is all it need be in the present age to command praise—"architectonic!" . In the age of Pericles that was taken for granted. The modern sculptor does not want to be a stonecutter and lose his identity and perhaps his head on the scaffold.

The Future Architectural Sculpture.

The last word has not been spoken in architectural sculpture. The Middle Ages gave a hint as to further possibilities. Then the structure was carved and sculpture was not extraneous except in the case of certain superfluous saints and angels who stood around in niches; but the pedestals were supported by lower types or by agonizing sinners who were integral with the structure, and who, doing the work, were in the eyes of modern philosophy the worthier objects. Can one imagine a pier head so wrought that the sculptural lines shall carry the structural strains from arch or wall to the pier? Can one imagine a sculptured console or corbel the lines of which shall indicate the nature of the stress and be harmonious with the character and individuality of the building? Can one imagine the spirit of the marble itself, the spirit of the granite, the spirit of the softer stone, appearing in the sculptured surface of the wall and readjusting themselves to the new conditions? Can one imagine rich sculpture adorning the parapet, crowning the structure, being the frieze and not

stuck against it? Can one imagine a unified creation with sculpture and structure blended, instinct with the sincerity of the Middle Ages as to structural principle, mystic as of Egypt in its symbolism, clear and limpid as of Greece in its intellectuality? One who can thus imagine need not be discouraged as to the future possibilities of sculpture in architecture. But these possibilities are not to be realised except inadequately in individual instances if the age is not unified in its characteristic attitude toward the great features of life, for in the expression of social or national ideals the individual cannot far exceed the limitations of his age. But the duty of the individual seems clear, for this spirit which finds an external expression in the State, the church, in society, and the social institutions, is not outside of him, it is within him, and it is his duty to express the highest in the attitude of his time and environment; and he is running counter to the laws of life when he conforms himself to the ideals of other and alien times, and does not seek to express that spirit which is within and about him.

Perhaps the architectural profession is thinking too much of itself as a profession and too little of itself as a mouthpiece of civilisation and society. As one in love with love and not with the object, it is in love with technique and not with the ideal. It advances the forms, the formalities, and does not enshrine the spirit, the essence. Not that forms and formalities are not on occasion desirable adjuncts and that on such occasion society should not be taught to respect them, but that always truth, integrity, broad comprehension, and responsiveness to the ideal should be fundamental in the character and equipment of every member of the profession and certainly of this body, and that the application of these characteristics should be made to his work in architecture.

HOUSE NEAR CHESTERFIELD.

PERCY B. HOUFTON, ARCHITECT

Brookside, Brampton, is a house built by the architect for his own occupation, and is situated two miles west of Chesterfield, Derbyshire, on the Chatsworth Road. The walling materials are thin beds of local sandstone of a grey-brown colour, richly stained in parts a reddish-ochre, built in mortar, and pointed in cement. The quoins are Derbyshire gritstone. It was interesting to find that a 16in. wall of these materials, so long discarded by local builders, costs no more than a 9in. wall of pressed brickwork, or of common brick rough-cast. The roof is covered with Barton-on-Humber tiles, which weather very quickly and approximate to the tone of the old local stone roofing slates which are not now quarried. The arrangement of the plan is partly dictated by the site, which has a north frontage to the road, and hence the living-rooms are placed to overlook the garden at the back. The set-back of 70ft. from the road minimises the dust nuisance, and brings the house under the lee of the existing line of trees on the west side. Internally, oak, elm, and white-painted deal woodwork have been used. The cost of the house, including drains and boundary fences, but excluding formation of garden, was £900. The builder was John Wright, of Chesterfield.

THE PRIORY, BURFORD: CHIMNEYPIECE IN THE BALL-ROOM.

IN PARLIAMENT.

(From Our Gallery Representative.)

The Clock Tower.

The conditions which are attached to a visit to the Clock Tower, from which a charming outlook is obtained, are worth knowing. Admission is practically limited to members of Parliament who, however, are allowed to conduct a few friends up the tower. The only other privileged persons are students of horology. In some respects it is a pity that so few are allowed to take advantage of a point of view which is unequalled even by the Campanile of Westminster Cathedral. The Clock Tower is the only place from which a satisfactory view of the general plan of the Houses of Parliament can be had. The river, too, overhung by drifting clouds of smoke in varying and well-defined tints, assumes an aspect at once attractive and familiar. The Victoria Tower is seldom ascended by anybody other than workmen, and the First Commissioner of Works has intimated that he does not desire to increase facilities of visitors to either of the two towers because it would be necessary in that case to appoint a special staff for purposes of supervision.

Housing of Torpedo Factory Workers.

Mr. Watt asked the First Lord of the Admiralty whether the Woolwich torpedo factory workers who were to be transferred to Greenock were raising objections to the housing accommodation procurable in Greenock; whether his department had approached the landowner there with a view to the purchase of land on which to erect suitable houses; and whether the price asked for the land rendered it possible to erect suitable houses for the workers at a reasonable price.

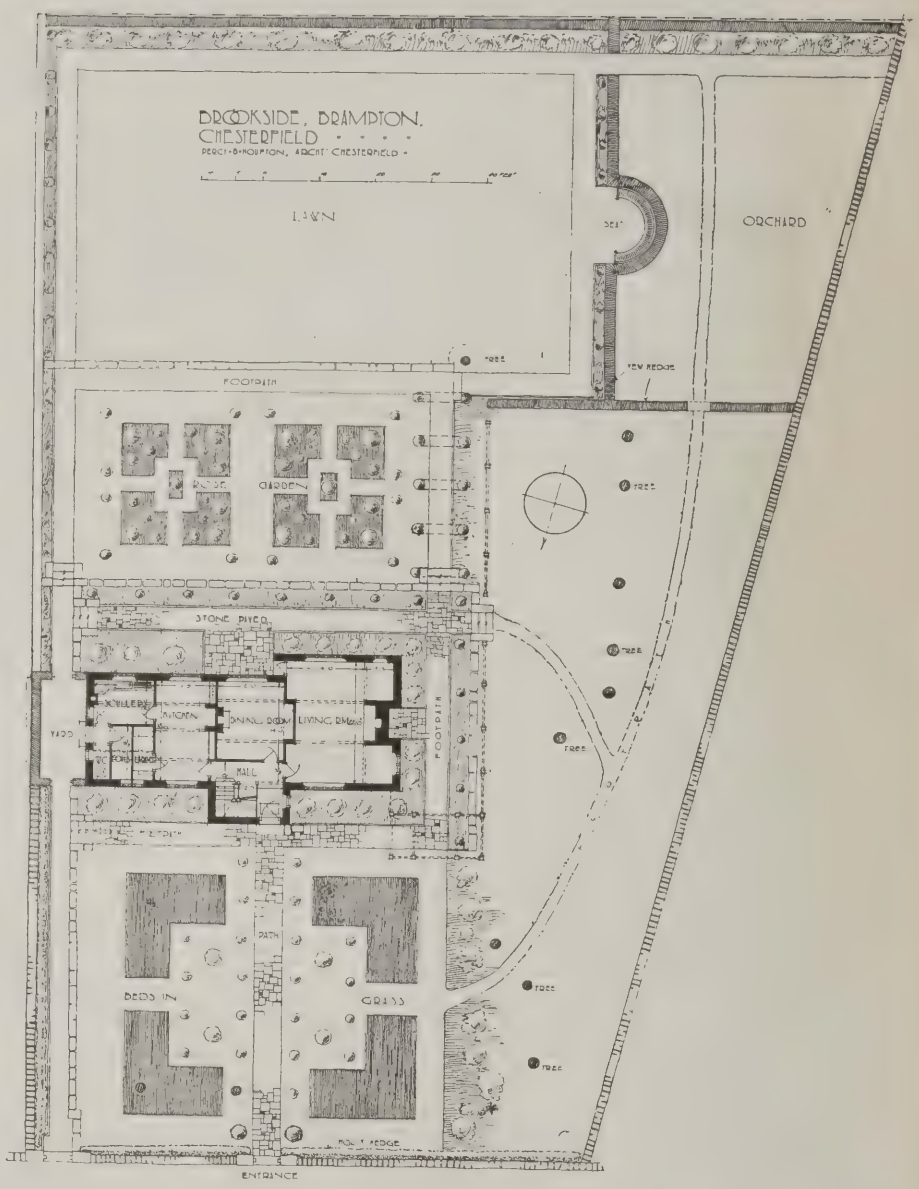
Mr. McKenna said the reply to the first part of the question was in the affirmative, but it was hoped that the objections would shortly be overcome by the erection of cottages by private enterprise. The reply to the second part of the question was in the negative, as the Admiralty had never contemplated buying land there for dwelling houses.

Employment in Welsh Slate Quarries.

In reply to a question by Mr. Ellis Davies, Mr. Masterman, Under-Secretary to the Home Office, has submitted a table showing the number of persons employed in the slate mines and quarries in North Wales during each of the years 1900 to 1909. In the mines the number decreased from 5,041 in 1900 to 3,118 in 1909; the numbers in 1903 and 1904 being the largest, viz., 5,213 and 5,168 respectively. Those employed in slate quarries numbered 9,481 in 1900, and 7,826 last year.

Photo: Richard Keene, Ltd.

This house was built by the architect for his own occupation. The walls, sixteen inches thick, of thin local stone, cost no more than a nine-inch wall of pressed brick or common brick rough-cast, though this stone has long been discarded by local builders.



BROOKSIDE, BRAMPTON, CHESTERFIELD: ENTRANCE FRONT. PERCY B. HOUFTON, ARCHITECT.

PICTURE EXHIBITIONS.

Society of Painters in Water Colours.

This is not one of the best of the Society's exhibitions. The most important of the members who deal with figure subjects are not happy. Mr. E. R. Hughes has painted four companion pictures, of the same size and character, dealing with four phases of the moon, each of which embodies an emblematic figure worked into the moon as part of it. These are interesting in a way, and might be arranged to produce a decorative combination; but they are too fantastic in conception to satisfy one as pictures. In "Rude Boreas" Mr. Anning Bell has made a very effective composition of blue-draperied figures blown by the wind, but the whole thing is spoiled by the realistic figure of "Boreas" on the right blowing at the figures from his open mouth. A better sense of humour would have saved the artist from painting what can only raise a laugh. Mr. Crocket's "The Miracle of Roses" is an interesting picture, but as a work of art it does not compare favourably with his previous treatment of more charming though less ambitious subjects. Miss Fortescue-Brickdale has devoted her great gifts to the painting of "A Bread-and-butter Miss" (rather a mature one)—a finely dressed young lady of the early nineteenth century; capital work, but the subject was not worth it. Mr. Walter West's "The First-born" would be thought an admirable interior with Georgian figures, did one not compare it in memory with others still better. No artist can be always at his best, of course; but the fact remains that the exhibition contains no figure-picture of the highest order of interest.

The strength of the exhibition is therefore in landscape, which is as good as usual. Mr. Colin B. Phillip is the most important contributor, with his two fine landscapes, "September Afternoon, Isle of Skye" and "Foggy Morning, Helm Crag, Grasmere"; the latter an effective treatment of a very difficult subject. It is interesting to compare Sir E. Waterlow's "Bridge near Pulborough," an excellent water-colour drawing of the old school, with Mr. North's "By the Dancing Rills," not far from it. The latter is a most beautiful and delicate effect, but it is not Nature, and Sir E. Waterlow's is. Which is best—to produce a poetic but totally unreal effect, or to give the fresh reality of an everyday scene? There will be opinions on both sides, but we are inclined to back Nature to win in the long run. So evidently thinks Mr. Eyre Walker, who represents Nature in her poetic rather than prosaic realities in his eight drawings, of which No. 123, "A Welsh Mountain Stream," a small drawing in an out-of-the-way corner, should by no means be overlooked. Mr. Allan, Mr. Robert Little, and Mr. Paterson are artists who represent Nature indeed, but represent it in subordination to a special style of their own, often with brilliant results; but Mr. Paterson's "Clearing after Rain," is somewhat too "blottesque." Then there is Mr. Albert Goodwin, who sees cities and scenes in a dreamland of his own creating. "Taormina" is the most fascinating of these visions, the remainder of which, like other things in this year's exhibition, are not up to the artist's usual mark. Mr. Arthur Hopkins paints foreground so well (see "Studland Moor") that it is a pity he does not confine himself to this class of subject instead of giving so much of his time to figure subjects in which he never seems able to rise above the commonplace.

There are a good many architectural subjects, those by Mr. Reginald Barratt being, as usual, pre-eminent, especially his fine large drawing of the entrance to the fortress of Gwalior. Mr. Rooke exhibits a carefully studied view of the interior of Siena Cathedral, and Mrs. Allingham makes an interesting picture of the old Clergy House at West Hoathley.

The Leicester Gallery.

A collection of paintings in oil and water by Mr. Charles Sims, at the Leicester Gallery, is well worth attention. Conspicuous among them is the large finished study for his Royal Academy picture "The Fountain," which is perhaps even superior to the picture itself. The variety of talent and of happy effects of colour and composition in this collection is remarkable; indeed, Mr. Sims only needs to take his art a little more seriously to rank as one of the most remarkable painters of his time. As it is, he seems too often to be rather playing with his art, though even in these instances his brilliant ability is manifest. In another room is a collection of "water-colours of the East," by Mr. Henry Simpson. These are good and conscientious work, and include some effective treatment of architectural subjects, especially a fine view of St. Sophia, Constantinople; "A Caravansary, Beyrout," is also a very good study of old buildings.

The Goupil Gallery.

"Camera pictures by Alvin Langdon Coburn and Baron de Meyer," is the title of a collection of black and white work at the Goupil Gallery. We do not understand exactly what is the point of the title "Camera Pictures," but there is a great deal of good work in the collection. Those of Baron de Meyer, chiefly figure studies, perhaps stand highest, but there is not very much to choose between the two artists. Mr. Coburn has some good studies of architectural subjects—street scenes among the high buildings at New York and drawings of old buildings in Holland.

The Royal Scottish Academy.

For the first exhibition of the Royal Scottish Academy in their new buildings next year a special effort is to be made, and it is expected the exhibition will be on a much more comprehensive scale than usual. In view of the importance of the exhibition it has been thought advisable to elect thus early the Arrangements and Hanging Committee as follows:—Mr. A. K. Brown, R.S.A.; Mr. E. A. Walton, R.S.A.; and Mr W. S. Macgeorge, R.S.A. (painters); Mr. Pittendrigh McGillivray, R.S.A.; and Mr. Percy Portsmouth, A.R.S.A. (sculptors); and Mr. G. Washington Brown, R.S.A.; and Mr. John James Burnet, A.R.S.A. (architects).

CONCRETE AND STEEL SECTION

(MONTHLY.)

The L.G.B. and Reinforced Concrete. The Local Government Board has been often assailed for its attitude towards reinforced concrete. In short, while it will grant a loan for 30 years on a building of any other construction, it will only allow a period of ten years for the repayment of a loan required by any local authority for a reinforced concrete structure. All sorts of bodies and individuals, influential and otherwise, have tried hard to get the local Government Board to withdraw from this position of "non possumus." It seems little use arguing that other Government departments are in favour of reinforced concrete and employ it considerably, or that numerous eminent authorities and independent engineers are convinced as to its lasting qualities, and even proclaim reinforced concrete as a system of construction, both as regards life and freedom from decay, superior to most other building methods. Nor does it seem to avail to point to the anomaly, the illogicalness, of placing exposed steelwork in the category of construction upon which a 30 years' loan period will be granted, while reinforced concrete, in which the steel is protected against corosion, is only granted 10 years' grace. Apparently there is nothing to be said, though it may be possible by pegging away to secure the removal of the ban. Still, there are some aspects at least in which something may be said that is not quite hackneyed. First, in respect to the life and resistance of reinforced concrete. Of course, in reinforced concrete we cannot point to works of any great antiquity, and the Local Government Board may argue that until the construction has reached a sufficient age to show its lasting quality, it would be unwise to officially sanction it. Apart from the fact that such an attitude is one which, if generally pursued, would retard the progress of any art and discourage invention, it is hardly to be sustained as a sufficient reason for refusing to listen to argument when we have the resources of modern science at our command to test the efficiency of any new invention. We would urge that even if reinforced concrete is comparatively new it is not quite so recent an innovation as to afford no evidence of time in respect to its life. The late François Coignet, who was the inventor of "béton Coignet"—a special concrete composed of hydraulic lime and aggregates mechanically mixed in proper proportions —is said to have constructed work in 1851, in which he reinforced his "béton Coignet" with iron sections. He took a patent in this country in 1855 for a system in which he used a meshwork of iron rods, but previously, in 1854, W. B. Wilkinson, of Newcastle-on-Tyne, had also patented the construction of floors and beams of Portland cement concrete, and from that time onwards did a considerable amount of reinforced concrete in the North of England. Also a M. Lambot, who took out an English patent in 1855, showed a punt of reinforced concrete at the Paris Exhibition of 1853. Afterwards, Matthew Allen, a London builder, patented a reinforced concrete floor in 1862, and built several floors in London. Philip Brannon's patent is dated 1870, and he built houses at Islington and Walton-on-the-Naze. Monier was constructing reinforced concrete abroad from 1873 onwards, and Thaddeus Hyatt executed some reinforced concrete floors in London about 1877. Houses built with reinforced concrete slabs in 1877 by the late W. H. Lascelles, at Croydon, and W. E. Ward's reinforced concrete house, built in 1875 at New York, are standing to-day. There is a building with reinforced concrete floors, walls, and roof in Lincoln's Inn Fields, which was built in 1880. We need not carry our record further, for that takes us back 29 to 59 years. That, surely, is sufficient test of time. Then the second point upon which emphasis may be laid is that because failures have occurred in reinforced concrete, of which the Engineer to the Local Government Board is aware, that is no proof that reinforced concrete construction cannot be satisfactory or that the material possesses inherent weaknesses. Brickwork, masonry, carpentry, and steelwork can be safely constructed, notwithstanding the many failures therewith. None of the failures in reinforced concrete is unexplained—all show negligence or gross carelessness, mostly in construction, and few show weakness in design. It is a simple matter to insist upon proper safeguards in construction and to test work on completion if any doubt is existent. The Local Government Board is not entirely oblivious to argument, however, for it will be recollected that it was induced to reduce the severity of its rural, intermediate, and urban codes of building by-laws, the first-named now permitting reinforced concrete structures to be erected without let or hindrance. The Board is therefore proceeding in one direction to make provision for this new method of construction, and it is, apparently, quite ready to meet local authorities who wish to adopt by-laws for such construction, there being several bodies who have made such provision and others who have started on the road by obtaining by-laws allowing the erection of steel frame buildings. So we must not despair. The Local Government Board's inspectors, of course, only act on instructions, and until they are permitted by the heads of their department to go into the matter of reinforced concrete construction they must dismiss it, except on a 10 year loan period. There have been anomalous cases in which longer loan periods have been granted in reinforced concrete by inadvertence or misunderstanding, but they do not constitute a precedent. Therefore, the responsible technical officer and his departmental chief are the ones that remain to be convinced. Mr. John Burns, the President, is a man of strong personality and fixed purpose, and if he is persuaded, as seems likely, that reinforced concrete is a doubtful system of construction, and one that should be discouraged, he will not be easy to convince, more especially as we have no strong trade union to help us in the matter. But if we do employ some unskilled labour in the execution of reinforced concrete work, this is no more than in other building trades. We also need much skilled labour, both on the part of the workmen and superintendents. Carpenters are employed on the centering and smiths on the steel, engineers on the concrete mixers, hoisting plant, and pile drivers, and the foremen and gangers are trained skilled craftsmen. The trade unions for these workers might obtain attention if they said something, and as reinforced concrete is a truly economical form of construction, it should appeal to such a powerful advocate of economy in local administration as Mr. John Burns. The extended employment of reinforced concrete is bound to redound to the benefit of the community at large, both in the saving of labour and material reduction of fire risk, longer life of structures, sanitary value, and general efficiency. Its extensive employment in Europe and America has proved that its fundamental advantages must cause it to forge ahead, and therefore such obstacles in the path of its progress as the present attitude of the Local Government Board in England are doubly regrettable; first, because they constitute a drag on progress; and secondly because of their futility. We cannot but think that before long the Local Government Board will realise the error of its way and will endeavour to make amends by pushing forward provisions to permit reinforced concrete to be constructed under local building by-laws in all districts, and will without more delay remove the restriction which has too long been suffered to discourage local authorities from employing it freely.

Water Tanks etc., in Reinforced Concrete. Reinforced concrete is particularly suitable for the construction of cisterns and tanks of every description. Wherever sand and gravel are found on or near the site there is the additional advantage of cheapness and rapidity of erection. For the purposes of waterproofing it is usual to plaster the internal surfaces with a rich cement mortar mixed 1 to 1, or a thin layer of asphalte is sandwiched in the concrete. A coating of tar or similar substances is often used but wants renewing from time to time. If the tank is sunk, asphalte coating is used externally to separate the structure from the ground. The bottom slab is often made of ordinary concrete, reinforcement being resorted to where the foundations are bad or doubtful. Tanks for the storage of acids are coated with a mixture of glycerine and red lead, or any of the many patent compositions on the market. Another good finish for such a tank is a lining of glass slabs closely fitted. As regards shape, circular tanks are more reliable than square ones; the latter are likely to become defective at the corners, and it is necessary to adopt heavy reinforcements to prevent bending or bulging out of the side wallings. The additional amount of materials required necessarily adds to the cost. As the stresses increase towards the bottom of tank, it is necessary to build in extra reinforcements for the lower portions of sides or, by equal distances, to increase the sectional area of rods. Vertical rods are principally adopted in order to keep the main rods in proper positions during concreting. The walling is made, as a rule, 4 inches thick at the top, increasing to 5 or 6 inches at the bottom. In case of large areas expansion joints must be provided. Particular attention must be paid to the workmanship, and care taken that the concrete has a uniform density and the various batches, as used, have a uniform quantity of water so as to set and dry out evenly.

REINFORCED CONCRETE SYSTEMS.

THE MOSS SYSTEM.

Messrs. William Moss and Sons, Ltd., of Queen Anne's Chambers, Westminster, who have carried out a considerable amount of reinforced concrete work as contractors upon various well-known systems, have now established a separate and special branch for executing this form of construction, under the direction of Mr. H. M. de Colleville, A.R.I.B.A., their chief engineer. Mr. de Colleville has been prominently connected with reinforced concrete design for some time past, and has been responsible for the design of many of the leading structures of reinforced concrete erected in the United Kingdom in recent years. While Messrs. William Moss and Sons, Ltd., do not propose tying themselves to any one system, holding that it is unwise to adopt any particular system or any particular reinforcing material for all the various members of a structure under the different states of stress to which they are subjected, they have recently introduced a system which is new to this country, though well known on the Continent, where it has been very extensively used, namely, the Pohlmann system. The claims put forward for this system are, in short:-

(1) Extreme simplicity; (2) ease of connecting to other steelwork; (3) rapidity of construction; (4) certainty of reinforcement remaining in proper position as required by the designer; (5) proper spacing and length of shear members; (6) positive bond between tension reinforcement and the concrete; and (7) absence of risk of damage in transit.

The distinctive feature of the Moss or Pohlmann system is the use of a joist-shaped main steel member in beams. There is no number of small rods embedded in any beam, but simply one section of a joist with reduced top flange. In the composite beam formed by using steel for the tensile member and the concrete of the floor plate for the compressive member, the two portions require to be united together in some secure way. In the Moss system this is attained by perforating the steel joist and inserting steel loops in the perforations, locked in position by steel wedges, to serve the triple purpose of giving mechanical bond, uniting the layers of concrete making up the beam, and reinforcing same against shear (diagonal tension) stresses. Fig. 1 shows the Moss reinforcement, and Fig. 2 gives the standard sections in use, while Fig. 3 shows their general application to a reinforced concrete floor. The weight of the various sections is (a) 21.6lbs.; (b) 17.3lbs.; (c) 13.2lbs.; (d) 12lbs.; (e) 9.1lbs.; (f) 6.77lbs.; (g) 5.22lbs. It will be noticed that the floor plate in this system is reinforced with rods in the usual manner, and the beams utilise a portion of same to serve as the compression flange of a T.

Before describing some special details of the system, we may refer briefly to some of the advantages that have been claimed for it in addition to the general claims put forward above. First, then, it is suggested that the combination of perforations, straps, and wedges as shown in Fig. 1 ensures an absolutely secure bond between the steel and concrete, without depending solely upon the adhesion of the steel to the concrete. Secondly, the design of the steel reinforcement in beams on this system in all cases involves fewer members and thereby effects considerable saving in the cost of fixing. Thirdly, the centering needed for the construction of the slabs or arches between the beams may be fixed to the steel girders so that no struts or props are required to the main floor or slab centering. The complete arrangement is a simple one and permits the placing of the steel in exactly the right position according to calculations. Beams reinforced on this system can be connected to cast iron or steel columns and stanchions without any difficulty, while connections to reinforced concrete columns are, of course, made in the usual manner. Another important point to remember is that if deemed necessary the whole of the concrete work in connection with the Moss floor may be carried out after the building has been roofed in, the steel girders being sufficiently strong to carry the incidental loads occurring in course of erection, thus ensuring great rapidity if necessary. Transmission shafts, travelling cranes, and other machinery may be easily fixed after completion of the floor, whereas with other reinforced concrete floors any subsequent fixing is difficult, and in many cases interferes considerably with the strength of the floor.

It is argued generally by Messrs. William Moss and Sons, Ltd., that their system ensures greater safeguard in practice than ordinary reinforced concrete construction, because the strength of ordinary reinforced concrete beams depends upon the adhesion between the concrete and the steel bars, and loading tests on such constructions have shown in many cases that rupture results long before the maximum stress that the steel will sustain has been attained, owing to the failure of the bond, the adhesive stress becoming excessive. It is for this reason that small steel sections are used in ordinary reinforced concrete construction, but this has its disadvantages because, in addition to the difficulty of handling, there is the difficulty of ensuring adhesion to a great number of small sections. Furthermore, it is difficult to keep the reinforcements in actual work in their correct positions as designed, owing to the liability in placing the concrete in the confined position around these bars without displacing some of them. It has often been found in practice that some of the bars are worked up during the concreting, so reducing the effective depth of the girder. Also in ordinary reinforced concrete one often sees stirrups provided to take diagonal tension which have no rigid attachment to the bars, nor any lock into the concrete, simply depending for their effect on adhesion. Now, in the Moss system, there is no need to worry about adhesion, because a complete bond is secured by the perforations and the loops, which are fastened to the steel joists by steel wedges (see Fig. 1), while the special binding straps are looped round so as to completely tie the concrete to the tensile reinforcing member. These loops or stirrups may, moreover, be graduated in spacing and in size to the stresses to be

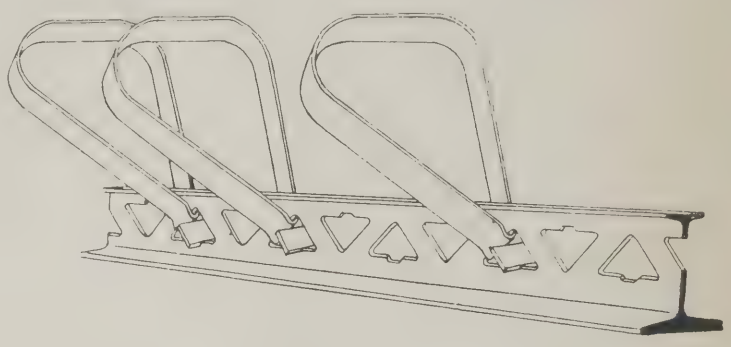

Fig. 1. Showing how the straps are fastened to the perforated girders.

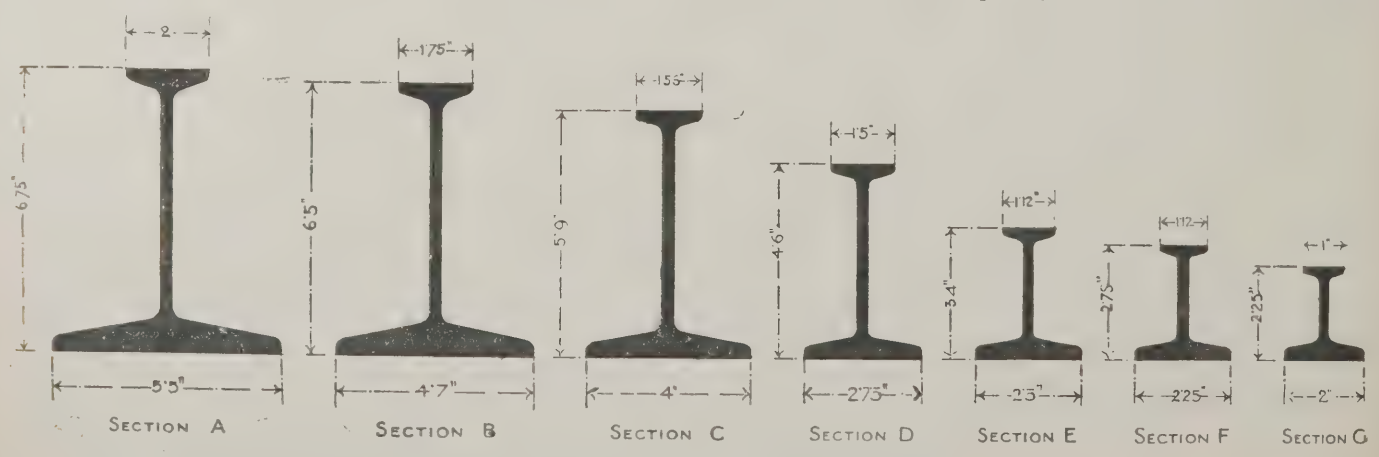

Fig. 2. Standard sections for constructing Moss floors.

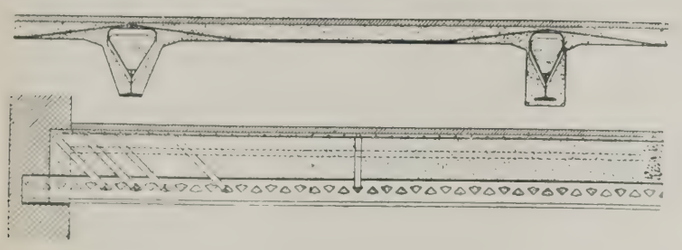

Fig 3. Sections of the Moss floors.

resisted. The usual plan, of course, is to use for the stirrups metal of a uniform section, the increased quantity of steel needed by reason of the increase in the shearing stress being obtained by a closer spacing of the stirrups. This plan Messrs. William Moss and Sons, Ltd., adopt. The stirrups, too, it will be noticed, are inclined at an angle of 45 degrees, which is theoretically the correct angle in a beam if we assume that the concrete affords no resistance in tension, and so is incapable of resisting diagonal tensile forces resulting from shear.

Figs. 4 and 5 show an arrangement for a floor of long span carrying heavy loads. The main beam supports the intercepting or secondary beams, which in turn carry the reinforced concrete flooring. Both main and secondary beams consist of the special standard steel girders, combined with concrete as before described, and no bolts, rivets, or fishplates are required for connecting them. The loops are correctly disposed near the ends of the special sections. Besides uniting the top concrete flange to the lower or tensile member of the T, they are resisting the horizontal shearing stresses which attain their maximum near the ends of the beams.

Fig. 6 shows the arrangement of the steelwork for continuous beams, the flat bars being bent up over supports in order to take up the negative moments produced at these points.

These special joists or girders have been used for other purposes than simply the construction of floors. For instance, Fig. 7 shows their use for the construction of a reinforced concrete foundation for a large chimney in unreliable ground, the reinforcement, as will be seen, consisting of the special perforated joists connected by L irons or rounds. Bridges have also been built on this system, and domes and roofs of all kinds have been reinforced with the perforated joists. In some cases these have been supplied bent to the shape. Messrs. William Moss and Sons, Ltd., are prepared to (1) give estimates for the steel reinforcement only; (2) supply complete designs and give estimates for the steelwork only; (3) where desired, carry out the actual construction of the work in every branch under guarantee.

The Pohlmann system has met with great success in Germany, where it has been used extensively in Government buildings.

Figs. 8 and 9 are views of work in course of construction. The following is a list of a few of the largest structures carried out on the system:—

Palace of Justice, Berlin-Moabit, (40,000 metres²); factory for Siemens and Halske

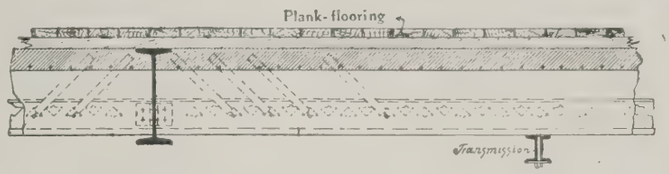

Fig. 4. Combination with main girder: longitudinal section.

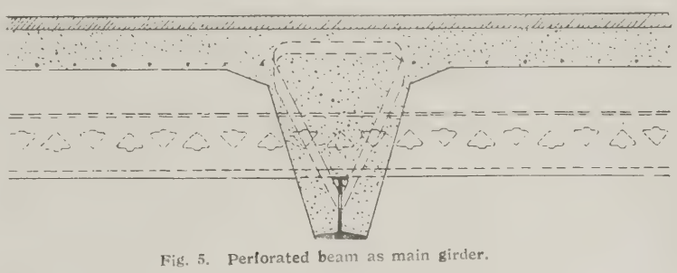

Fig. 5. Perforated beam as main girder.

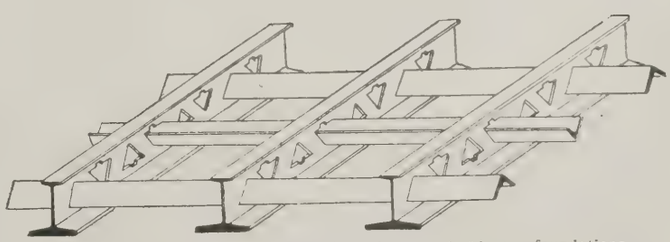

Fig. 7. Grill of perforated girders for column and chimney foundations in unreliable ground.

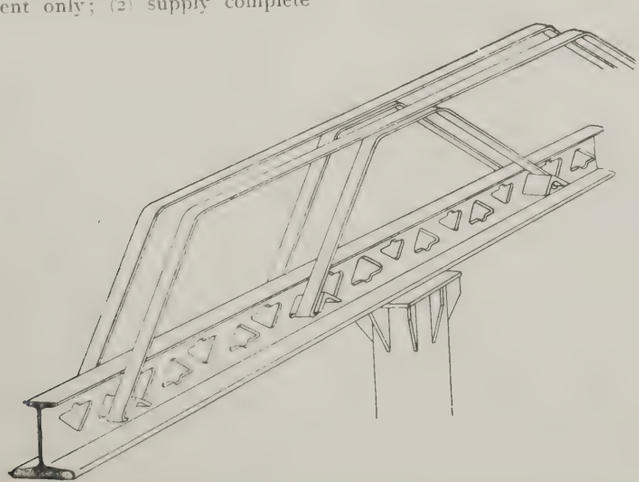

Fig. 6. Framing of flat-bars over the middle support of a continuous beam.

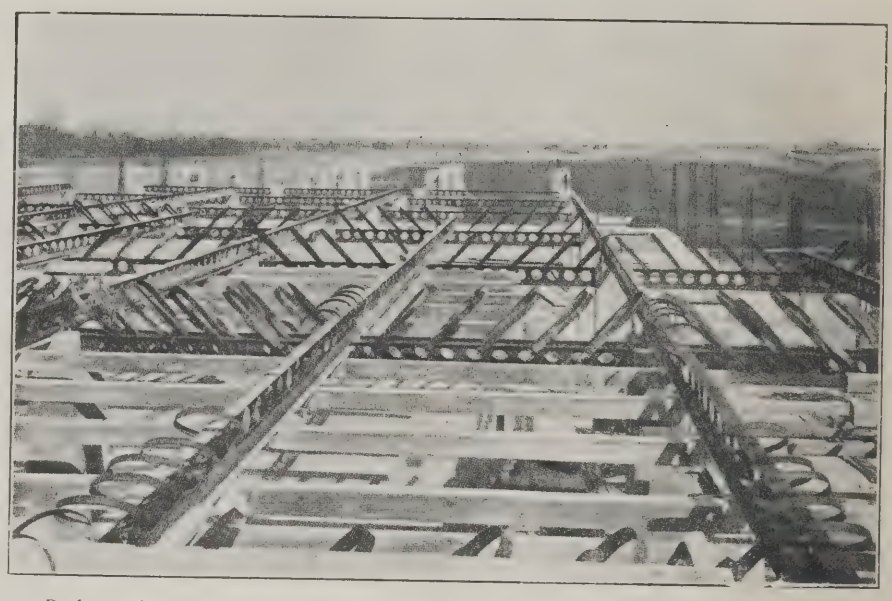
A.G., Wernerwerk, Spandau (50,000 metres²); offices and factory for Siemens and Halske A.G., Charlottenburgerwerk (30,000 metres²); Harbour Werehouses, Templehof, on the Teltow Canal (18,000 metres²); factory, Arnold Kuthe, Lichtenburg (16,000 metres²); business premises for Hiller and Kuhlmann, Charlottenstrasse 7 (12,000 metres²); factory for H. Mittag, Gerichstrasse 23 (15,000 metres²); Industrial Palace, Schlesische Strasse 29/30 (14,000 metres²); and warehouse in Moldau Docks, for Finance Deputation, Hamburg (10,000 metres²).

We may mention, in conclusion, that Messrs. William Moss and Sons, Ltd., were the contractors for the following important works on various systems: Floors and ceilings, Leicestershire and Rutland Asylum, Narborough; roofs of extensions at National Gallery; bridge, stands, and other works at York Racecourse; water towers at York; Ramsdale Hill Reservoir, Daybrook, for Nottingham Corporation; floors at Leicester Causeway Schools, Coventry; floors, Elementary Schools, Gainsborough; and Keldgate Reservoir for the City of Hull.

BOOKS.

The Inspector of Reinforced Concrete.



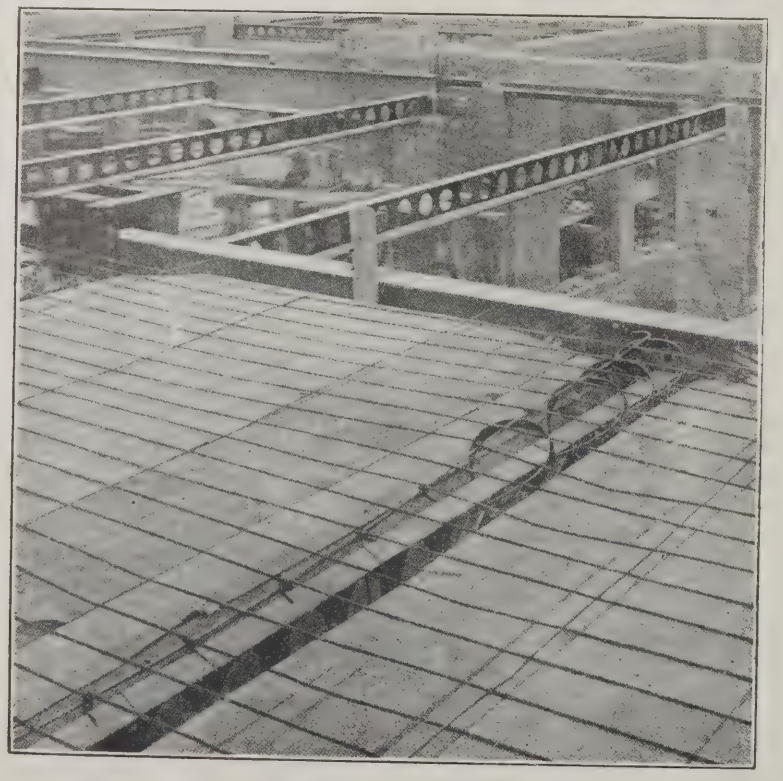
"Inspector's Handbook of Reinforced Concrete." By Walter F. Ballinger, A.Am.I.A., M.Am.Soc.C.E., and Emile G. Perrot, A.Am.I.A., A.M.Am.Soc.C.E. Price 4s. nett. London: Archibald Constable & Co., Ltd.

The superintendent or inspector of reinforced concrete is a very important person, for on him depends the strength of the structure as much as upon the engineer who designed it. The nature of reinforced concrete is such that intelligence must be used in its execution. Almost all failures that have occurred were attributable to errors in workmanship. The inspector not only has to see that the drawings are rightly being interpreted and that the workmanship is good, but he must keep an eye open for any little discrepancies in the drawings. He must be acquainted with the practical methods of carrying out such work, but must also be familiar with the theory of the subject in a general way. This book by two American authors who have had a great deal of experience in reinforced concrete construction contains much valuable information to the superintendent, and we advise him to purchase it. In an appendix calculations are dealt with and short formulæ given, together with some diagrams that will be useful in designing or checking work. The diagrams for the strength of T beams are particularly useful. The book is only a small one, and we wish that it had been larger, with more illustrations included as examples. We hope that future editions may be improved in this way.

A Pamphlet on Design.

"Reinforced Concrete Construction: A Handbook for Engineers and Architects." By W. Noble Twelvetrees, M.I.Mech.E., A.M.I.E.E., &c. London: "The Local Government Officer," 36-38, Whitefriars Street, E.C. Price 1s.

This is another of the series of short essays on reinforced concrete design and practice which Mr. Twelvetrees seems to be writing for various journals and republishing in pamphlet form to a uniform size. Mr. Twelvetrees in this pamphlet of 40 solid pages repeats what has been said a good many times now, but the subject is not hackneyed to all, and to those unfamiliar with reinforced concrete design it may serve a useful purpose. We do, however, doubt the advisability of repeating all the elaborate formulæ for the consumption of fresh readers. It would surely be better to give just a short and clear exposition of the main principles entailed in the calculations and leave those who wish to go into the matter more fully to consult the text-books. Empirical formulæ are good enough for the average building trade reader, and some diagrams might have been advantageously furnished to give accurate figures in conjunction therewith rather than this elaboration and repetition of what is bound to be confusing to the student.



Dock warehouse on the Teltow Canal, Tempelhof, near Berlin. (To carry heavy loads.)

FIG. 9. THE MOSS SYSTEM.

An American Specialist on Reinforced Concrete.

"Concrete Steel Construction." By C. A. P. Turner, M.Am.Soc.C.E. Price $2o. Minneapolis, Minn.: Farnham Printing and Stationery Co.

We can often learn a great deal from the writings of specialists who are engaged in the business of reinforced concrete, especially when they put forward their own pet theories and their practical experience in as impersonal a way as they can, but we do like to see those views put forward in a straightforward way, without "high diplomacy" and innuendo. The writings of commercial specialists are always biased and open to suspicion, and that should make them very careful in casting slurs upon their competitors, especially by innuendo. The trade catalogue is the more proper means of vaunting their superiority over others, and of attacking in front, on flank or in rear, and we do not hold that they should confine themselves to that medium, and never write what purport to be text-books or treatises, but we think that it is their duty to the public not to issue a catalogue in the guise of a book. Now, this work by Mr. C. A. P. Turner, the inventor of the "Mushroom" system of reinforced concrete and an American specialist engaged in the trade of reinforced concrete pretends to be a treatise, but we can only view it in the light of a catalogue. It is full of the author's personal views on the theory and practice of reinforced concrete, which, expressed in a proper way, would be valuable and deserving of attention. He says much that is to the point, and expresses opinions that would be worthy of respect on our part, were it not that he has seen fit in this book to attack his rival specialists unmercifully. He criticises rival systems freely, and goes out of his way to refer to any failures he can find with a view to pointing out how much superior his own methods are, and is not at all generous in offering the explanations or excuses which are obvious.. Most of the failures he refers to are attributable to contractors' carelessness, negligence or scamping, errors in workmanship, or the unknown, and it is quite unfair to use them to belabour other systems. He himself refers to some mishaps he has had from similar causes, and explains them glibly. We ask him how he would like having them held up by his rivals? This book chiefly describes the "Mushroom" system, and though it is in the nature of a catalogue, certainly contains interesting reading.

Second stage of the construction: view of floors before concreting.

FIG. 8. THE MOSS SYSTEM. SIEMENS AND HALSKE, WERNERWERK, SPANDAU.

A Concrete Dictionary.

A technical dictionary in six languages—German, English, French, Russian, Italian, and Spanish—devoted to "Reinforced Concrete in Sub and Superstructure," has for its London publishers Messrs. Constable and Co., Ltd., 10, Orange Street, Leicester Square, by whom it is sold at 6s. net. It has been compiled by Heinrich Becher, who has had the assistance of many expert coadjutors. About 900 illustrations and numerous formulæ are included.

STANDARD BUILDING REGULATIONS FOR THE USE OF REINFORCED CONCRETE IN THE U.S.A.—PART I.

[This code was voted on at the 1909 Cleveland convention of the National Association of Cement Users in the United States, was amended at the Chicago convention at the end of February, and will now be subjected to final ballot.]

Definitions.

1. The term "Reinforced Concrete" shall be understood to mean an approved concrete which has been reinforced by metal in some form so as to develop the compressive strength of the concrete.

2. Reinforced concrete may be used for all classes of buildings if the design is in accordance with good engineering practice and stresses are figured as indicated in these regulations.

3. There shall be no limit upon the height of buildings of reinforced concrete except as limited by the requirements in these regulations.

4. Before permission is granted by the Building Department to erect any reinforced concrete building, complete plans, accompanied by specifications, signed by the engineer and architect, must be filed with the Building Department and remain on file for public inspection until the building is completed.

5. The Building Department shall have access to the computations, which shall give the loads assumed separately, such as dead and live loads, wind and impact, if any, and the resulting stresses.

6. The specifications shall state the qualities of the materials to be used for making the concrete, and the proportions in which they are to be mixed.

7. Upon the completion of the building the engineer and architect shall issue, under the approval of the Building Department, signed certificates, to be posted on each floor of the building, stating the safe carrying capacity per square foot.

8. There shall be kept an exact record of the progress of each operation where the same can be inspected by the Building Department. These records shall show the date of placing of all the concrete and date of removal of the forms, and must be turned over to the Building Department when the building is completed.

9. Reinforced concrete walls may be used in place of brick or stone walls with thickness reduced two-thirds the thickness called for for brick walls. Curtain walls shall not be less than 4ins. thick.

10. Concrete walls must be reinforced in both directions. The maximum spacing of reinforcing bars shall be 18ins. between centers, reinforcement in both faces of the wall being considered. Total reinforcement shall not be less than one-fourth of one per cent.

11. Wherever floor constructions are built with a combination of tile or other fillers between joists, the following rules regarding the dimensions and methods of calculations of construction shall be observed.

(*a*) Ratio of minimum depth to clear span of joist shall not be greater than one to eighteen.

(*b*) Wherever a portion of the slab above the tile joist shall be considered as acting as a T-beam section, the slab portion must be cast monolithic with the joist and must have a minimum thickness of at least 2ins. on all spans. Otherwise, all regulations applying to T-beams shall apply to tile and joist construction.

(*c*) Where the joists are figured as rectangular beams, in accordance with the standard regulations for this type of beams, the slab shall be considered as independent of the structural part of the building.

(*d*) Wherever porous tiles, or other materials, which by their nature will absorb water from the concrete, are used between the joists, care must be taken to thoroughly saturate the tiles, or other materials, with water immediately before the concrete is placed.

(*e*) Reinforcement for slabs over joist construction below 30in. centers need not be closer than 24ins. in each direction.

Cement.

12. Only Portland cement shall be used in reinforced concrete structures. Portland cement shall meet the requirements of the Standard Specifications for Cement of the American Society for Testing Materials. (See Standard No. 1 of the National Association of Cement Users.)

13. Tests of cement used in building operations shall be made from time to time under the supervision of the Building Department in accordance with the preceding specifications. No brand of cement which has not met these requirements shall be used.

Aggregates.

14. Extreme care shall be exercised in selecting the aggregate for mortar and concrete, and careful tests must be made, where any doubt exists, of the materials for the purpose of determining their qualities and the grading necessary to secure maximum density or a minimum percentage of voids.

15. Fine aggregates shall consist of sand, crushed stone or gravel screenings, passing when dry a screen having ¼in. diameter holes, and not more than 6 per cent. passing a sieve having 100 meshes per lineal inch. It shall be clean, silicious material, free from vegetable loam or other deleterious matter.

16. Mortars composed of one part Portland cement and three parts fine aggregate by weight when made into briquets should show a tensile strength of at least 70 per cent. of the strength of 1.3 mortar of the same consistency made with the same cement and standard Ottawa sand.

17. Coarse aggregate shall consist of inert material, such as crushed stone, or gravel, which is retained on a screen having ¼in. diameter holes; the particles shall be clean, hard, durable, and free from all deleterious material. The maximum size of the coarse aggregate shall be such that it will not separate from the mortar in laying and will not prevent the concrete fully surrounding the reinforcement or filling all parts of the forms.

18. The maximum size for reinforced concrete shall be such that all the aggregate shall pass a 1¼in. diameter ring.

Cinder Concrete.

19. Cinder concrete shall not be used for reinforced concrete structures; it may be used for fireproofing. Where cinders are used as the coarse aggregate they shall be composed of hard, clean, vitreous clinker, free from sulphides, unburned coal, or ashes.

Reinforcement.

20. Medium steel for reinforcement of concrete shall be made from new billets and shall conform to the requirements of the specifications for structural steel adopted by the American Railway Engineering and Maintenance of Way Association.

The Building Department shall at its option in lieu of this grade of steel accept medium steel meeting the requirements of the manufacturers' standard specifications, provided the Building Department shall be furnished with the results of two tests made originally by the manufacturer. Tests being taken from each melt, one for bending and one for tension, and provided further that the contractor furnishing such steel shall furnish such additional bars of all sizes for thoroughly testing by the Building Department.

21. High elastic limit steel shall have (1) an elastic limit of 50,000 to 65,000 lb. per square inch, (2) a minimum elongation in per cent. in 8in. of 1,000,000—(ultimate strength), and (3) be capable of cold bending 180 deg. around four diameters without fracture.

Mixing.

22. General.—The ingredients of concrete shall be thoroughly mixed to the desired consistency, and the mixing shall continue until the cement is uniformly distributed and the mass is uniform in colour and homogeneous.

23. Methods of measurement of the proportions of the various ingredients, including the water, shall be used, which will secure separate uniform measurements at all times.

24. Machine Mixing.—When the conditions will permit, a machine mixer of a type which insures the proper mixing of the materials throughout the mass shall be used.

25. Hand Mixing.—When it is necessary to mix by hand, the mixing shall be on a water-tight platform, and especial precautions must be taken to turn the materials until they are homogeneous in appearance and colour.

26. Consistency.—The materials must be mixed wet enough to produce a concrete of such a consistency as will flow into the forms and about the metal reinforcement, and which, on the other hand, can be conveyed from the mixer to the forms without separation of the coarse aggregate from the mortar.

27. Retempering mortar or concrete, i.e., remixing with water after it has partly set, shall not be permitted.

Placing Concrete.

28. General.—Concrete shall be placed in the work immediately after mixing and deposited and rammed or agitated by suitable tools in such a manner as to produce thoroughly compact concrete of maximum density. No concrete should be placed until the reinforcement has been placed and firmly secured by wiring or other methods to prevent displacement.

29. The faces of concrete exposed to premature drying shall be kept damp for a period of at least seven days.

30. Before placing the concrete care shall be taken to see that the forms are substantial and thoroughly wetted, and the space to be occupied by the concrete free from debris. When the placing of the concrete is suspended, all necessary grooves for joining future work shall be made before the concrete has had time to set.

31. When work is resumed, concrete previously placed shall be roughened, thoroughly cleansed of foreign material and laitance, drenched and slushed with a mortar consisting of one part Portland cement and not more than two parts fine aggregate.

32. Placing in Water.—Concrete should not be placed in water, unless unavoidable. Where concrete must be placed under water, unusual care must be taken to prevent the cement from being floated away.

33. Freezing Weather.—Concrete shall not be mixed or deposited at a freezing temperature unless special precautions are taken to avoid the use of materials containing frost or covered with ice crystals, and to provide means to prevent the concrete from freezing after being placed in position and until it has thoroughly hardened.

Placing Reinforcement.

34. The reinforcement shall be accurately located in the forms and secured against displacement.

Joints.

35. Reinforcement.—Wherever it is necessary to splice reinforcement by means of lapping, the length of the lap shall be determined upon the basis of the safe bond stress and the stress in the bar at the point of splice; or a connection shall be made between the bars of sufficient strength to carry the stress. Splices at the point of maximum stress must be avoided.

36. In columns large bars (bars with area equal to 1¼in. diameter round or larger) shall be properly butted and spliced. Smaller bars may be lapped as indicated in paragraph 35.

37. Concrete.—Reinforced concrete work shall be stopped at such points that the joints will have the least possible effect on the strength of the structure. Footings shall be cast to their full depth at one operation.

(*a*) Columns.—Work in columns shall be stopped at the underside of the lowest projection at the head of the column.

(*b*) Beams and Girders.—Construction joints in beams and girders shall be vertical and within the middle third of the span. Any concrete which may run past the bulkheads must be cleared up before the concreting of the next section is started. Where brackets are used, the bracket shall be considered as a part of the beam or girder.

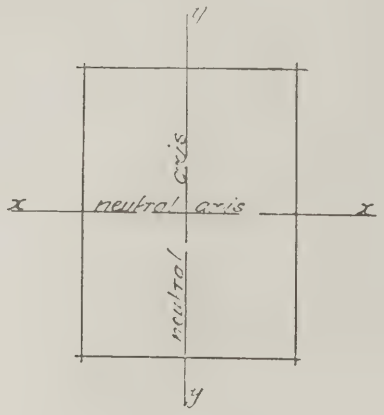
(*c*) Slabs.—Construction joints in slabs shall be near the center of the span. No joint will be allowed between slab and beam or girder.

Removal of Forms.

38. Under no consideration shall forms be removed until the concrete has hardened sufficiently to permit their removal with safety.

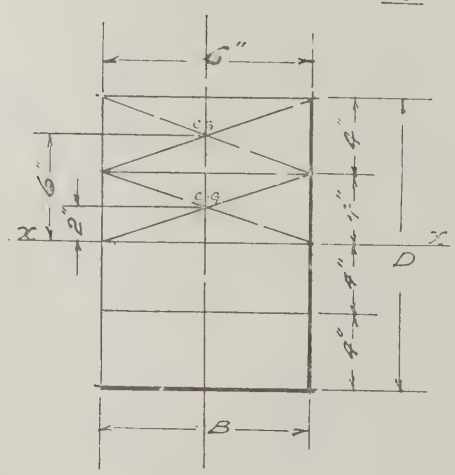
39. Floor Slabs and Beams.—Forms shall not be removed from floor slabs in less than seven days. Sides of beams may be removed at the same time as the floor slabs provided original supports under beams and girders are left in place.

40. Columns.—Where original supports remain under beams and girders coming to the columns, the forms shall not be removed from the columns in less than four days.



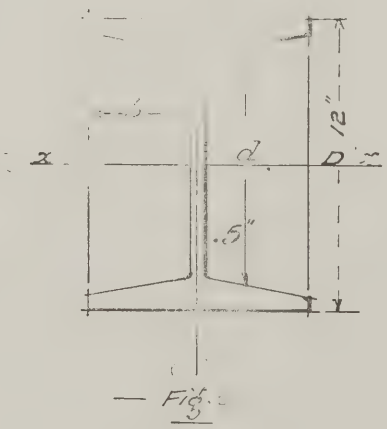
Removal of Supports.

41. Beam and Girder Supports.—The original supports for all beams and girders must remain in place at least ten days, but all beams and girders having more than 30ft. span from center to center of support shall be considered as special cases and shall be subject to inspection of the Building Department before removal of supoorts. The length of time before the removal of forms shall be increased in all cases and additional time for each and every day that the thermometer registers anytime during the day or night below 35 degrees Fahrenheit.



Part II.

The second part of these rules, dealing with the questions governing design and calculations for the design of structures, will be given in a subsequent issue.



(To be concluded.)

DIAGRAMS ILLUSTRATING "THE STRENGTH OF ROLLED STEEL BEAMS."

THE STRENGTH OF ROLLED STEEL BEAMS.

A ready knowledge of how to ascertain the value of the properties of any section is necessary to the designer if he desires to use the material to which he is committed with the greatest economy. An inspection of a "Beam Sheet" or "Handbook" of sections, such as is usually published by the rolling mills, will reveal two divisions, one of which deals with the "Properties of sections," and the other sets forth the safe loads uniformly distributed over spans of varying length. It is probably the latter for which the "sheet" or "hand-book" is in greater demand.

How many are there, who, if called upon to select their beams from a sheet, or table, the information on which was confined to the properties of the various sections, could do so with precision and certainty? And again, how many who use the handbooks could fill in from their own calculations and analysis the information required under the various headings of "Moment of Inertia," "Radius of Gyration," "Section Modulus," etc. Yet a knowledge of the above is necessary in making selections of rolled steel beams for use under various conditions of loading, and also in the designing of stanchions and struts. In structural work these properties consist of, "The Moment of Inertia," "The Modulus Section," and the "Radius of Gyration."

Moment of Inertia.

The first operation then is to determine the value of the "Moment of Inertia," from which the remaining two properties can be easily found.

The definition of "Moment of Inertia" will be found in all works on mechanics. It is a mathematical expression which is a constant value for any particular section, and is an indication of the capacity for strength of the section to which it refers.

The mass of a body is no indication of its strength from a structural point of view—that depends upon the shape or the disposition, or distribution, of the material about a line passing through its centre of gravity.

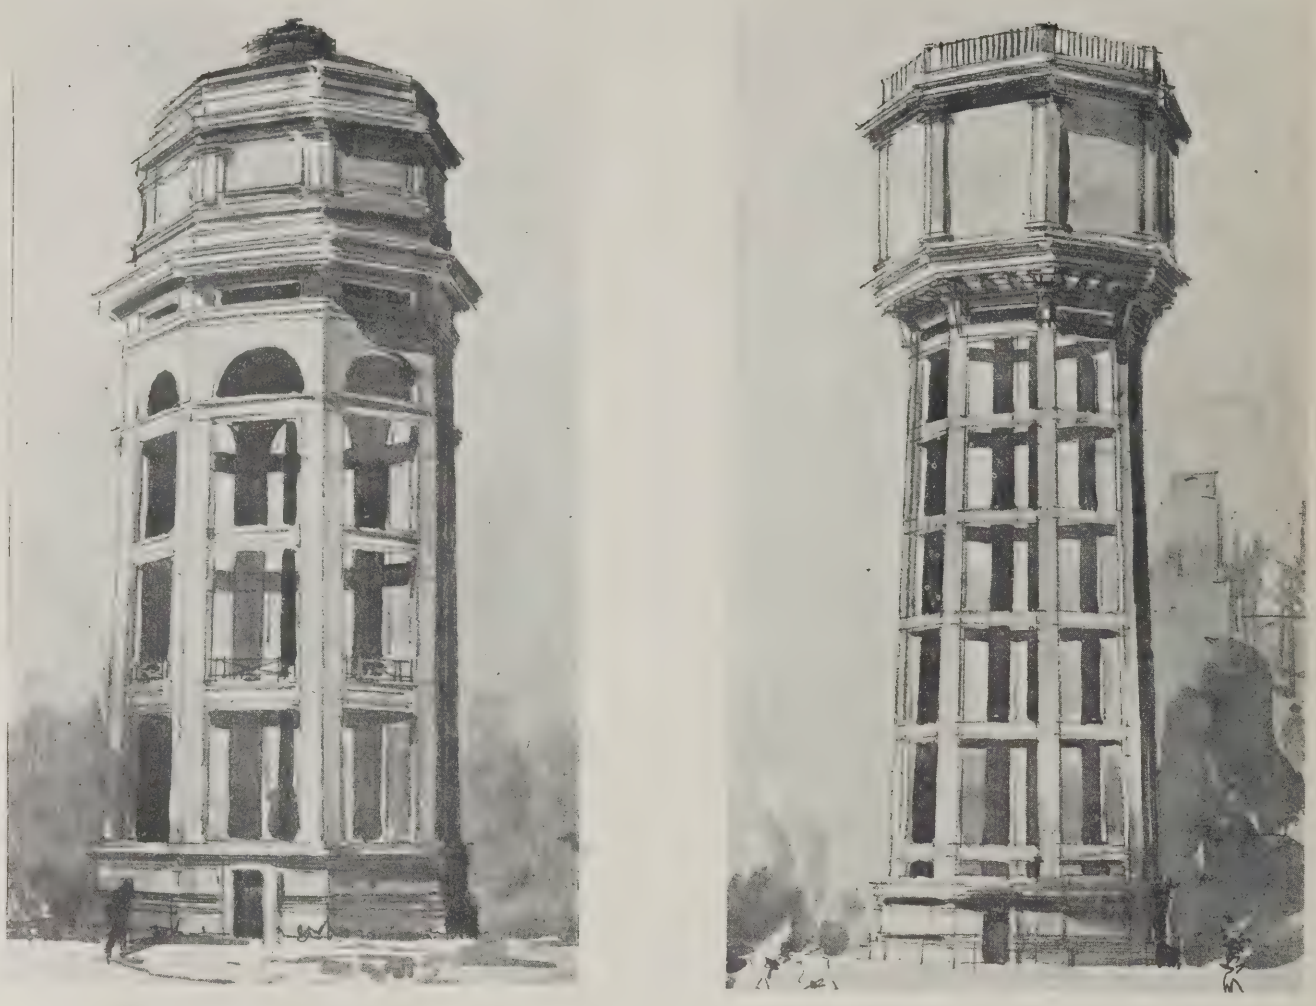
By reference to the section in Fig. 1, it will be seen that two lines or axes, "x—x" and "y—y," pass through the centre of gravity of the figures, these lines represent the neutral axes of the sections or figures, and although the moment of inertia may be found about any other axis, it is about these two axes that the value of inertia is of the most practical utility in the case of beams and stanchions.

The definition of the moment of inertia of a plane figure may be described as follows:—

"If a section or plane surface be imagined to be divided into an infinite number of thin laminae, and if the area of each lamina be multiplied by the square of the distance between the centre of gravity of the lamina and the axis, the sum of all these products is the moment of inertia of the plane surface with respect to that axis."

A reference to Fig. 2 will assist in simplifying the above. Let us suppose that the number of laminae consist of two on each side of the neutral axis, x—x. The moment of inertia of the rectangle on that assumption will be

$$(5\times4\times6^2)+(5\times4\times2^2)=960\times2=1920$$



It is evident that the process of division into the laminæ could continue *ad infinitum*, and that the greater the number of divisions or laminæ the nearer the true moment of inertia would the resulting value approach. By the ordinary means of calculation it would be impossible to attain this result; but by the calculus we are enabled to deduce formula for finding the value of the inertia of most of the elementary figures.

These views show the towers in course of construction. That on the left holds 100,000 gallons and is 100 feet high. That on the right is carried on concrete piles, 40 feet long it is the same height, but holds 20,000 gallons. Both are constructed with Kahn reinforcement by the Trussed Concrete Steel Co. Views of the towers as they will appear when finished appear on page 396.

REINFORCED CONCRETE WATER TOWERS FOR THE NORTH EASTERN RAILWAY CO., YORK.

These two drawings illustrate the towers (shown during construction on page 395) as they will appear when completed.

REINFORCED CONCRETE WATER TOWERS FOR THE NORTH EASTERN RAILWAY CO., YORK.

This the formula for a rectangle is $\frac{BD^3}{12}$ and for a square $\frac{B^4}{12}$ So that the true value of the moment of inertia of the rectangle in Fig. 2 is $\frac{6 \times 16^3}{12} = 2048$.

Apply the above process to determine the inertia about the axis x—x of the section in Fig. 3

The section—a rolled beam with equal flanges—may be enclosed in a rectangle BD This rectangle BD would then be composed of the rolled beam and two small rectangles on each side of the web. And since the neutral axis x—x passes through the centre of gravity of all the figures, it is possible by deducting the inertia of the two rectangles on each side of the web from the inertia of the containing rectangle BD to arrive at the value of the moment of inertia of the remainder which is the rolled section.

The formula then for a rolled beam is

$$\frac{BD^3 - 2bd^3}{12}$$ See Fig. 3.

Substituting the dimensions in Fig. 3 for the above we have

$$\frac{6 \times 12^3 - 2 \times 2.75 \times 10.5^3}{12} = 333.421$$

Next, calculate the moment of inertia about the axis y—y. Fig. 4. The beam is now turned upon its side so that "D," the actual depth of the beam, takes the place of "B" in the formula. The simplest process of arriving at the inertia in this case is to calculate the inertia of each flange and the web independently about the axis y—y, which is common to all three: that is, it passes through the centre of gravity of each figure. The moment of inertia about y—y is

$$\frac{2 \times (.75 \times 6^3) + 10.5 \times .5^3}{12} = 27.109$$

It will be seen that the moment of inertia about x—x is greater than the inertia about y—y.

These are described as the greatest (x—x) and least (y—y) moments of inertia, and it is these two values that it is necessary to first determine before a correct estimate of the structural value of any section can be deduced.

Section Modulus.

From the moment of inertia the value of the section modulus or "strength modulus" may be obtained by dividing by half the depth of the beam; or, in other words by dividing the moment of inertia by the distance of the extreme fibres from the "neutral axis." This value will be better understood by an illustration, Fig. 5. Assume a solid rectangular beam supported at each end and loaded, and for clearness let the deflection of the beam due to the load be shown in an exaggerated manner as in Fig. 5. It will be seen that the fibres above the neutral axis are shortened, while those below the neutral axis are extended. The fibres along the neutral axis, are neither shortened nor extended but remain the same in length as they were before the application of the load.

This alteration in the length of the fibres is defined as the "strain" and the resistance of the fibres to this change is defined as the stress. There is then little or no "stress" at the neutral axis, since there is no "change" in length or strain; also the further away the fibres are placed from the neutral axis the greater will be their degree of strain or change in length, and consequently their stress.

The nature of this stress is known as "compression" or "tension" according as to whether the fibres are shortened or lengthened.

Now imagine that these varying degrees of stress in the fibres can be represented on the section of a beam by lines of varying thicknesses as in Fig. 6. Here are lines, or fibres, of uniform length, but of varying degrees of stress commencing with "zero" at the "neutral axis," and increasing in intensity of stress until the outside or extreme fibres are reached, where the stress is a maximum. This stress on the extreme fibres should not exceed one-fourth of the ultimate breaking stress (28 to 30 tons) for structural steel.

Instead, however, of having fibres of uniform length and varying degrees of stress imagine the conditions to be reversed, so that the fibres are of varying lengths, but uniform in stress. The lines on the section in Fig. 7 will now be of the same thickness from the "neutral axis" to the outside, because the stress in each fibre is assumed to be the same as the stress in the extreme or outside fibre, but to maintain, as it were, the balance, a process of "give and take" occurs. So that while the outside fibre remains the same in length, because no addition to the stress is *assumed* to take place, the next fibre to it must be shortened a little to compensate for the stress which we *assume* is added to it to make it of the same degree of stress as the extreme fibre.

Hence the lengths of the fibres must decrease uniformly from the outside to "zero" at the "neutral axis," and the section is as represented in Fig. 7. This surface, which is shown sectioned in Fig. 7, is known as the "Inertia Area," and the "Modulus section" is the moment of this area about the "neutral axis." The moment of a surface about an axis is the area of that surface multiplied by the distance from its centre of gravity to the axis.

Take the surface represented by the "Inertia Area" in Fig. 7. The centre of gravity of each triangle is at one-third of its vertical height from the base. Now if the width of the rectangular section in Fig. 7 be represented by "B" and the depth "D," its area, will be $B \times D = BD$, and since one triangle is one-fourth of the whole rectangle, its area will be $\frac{BD}{4}$. To get the modulus section of this area about the neutral axis, it must be multiplied by the distance between its centre of gravity and the axis, which is one-third of the depth D or $\frac{D}{3}$. Therefore the section modulus of one triangle is

$$\frac{BD}{4} \times \frac{D}{3} = \frac{BD^2}{12}$$

But the whole beam section is composed of two triangles of inertia area; therefore the section modulus of the whole beam will be

$$\frac{BD^2}{12} \times 2 = \frac{2BD^2}{12} = \frac{BD^2}{6}$$

This then is the formula for obtaining the section modulus of any rectangular solid beam, and it is this value by which a selection should be made of a rolled steel beam of the standard sections, published by the rolling mills.

It has been stated that the section modulus may be obtained by dividing the moment of inertia by half the depth of the beam. Therefore $\frac{BD^3}{12} \div \frac{D}{2} = \frac{BD^2}{6}$ as before.

The inertia area of a rolled section of steel beam is as represented in Fig. 8.

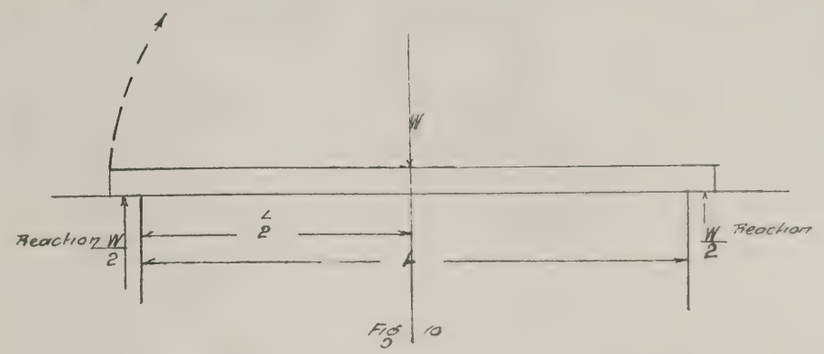


Fig 10

Strength of Material

Reference has before been made to the "stress" set up in the fibres by their resistance to the "strain" caused by the loads applied to a beam. It is evident that the degree of this resistance will depend upon the material of which the beam is built.

The strength of the material is usually expressed in "lbs." or "tons" per sq. in. of section, the former unit of "lbs. per inch" is confined as a rule to American practice in this country the stress is expressed in "tons per inch." The breaking stress of structural steel is 28 to 30 tons per square inch of section. It is unnecessary to state that in practice the working stress must never approach the ultimate breaking stress, but should be well within the "elastic limit" of the steel, that is to say, the load should be such as not to cause any "permanent set" in the steel by over-straining it. The "elastic limit" for structural steel is usually taken at 14 tons per sq. in., or about half the ultimate strength. The working stress should not be greater than one-fourth of the ultimate stress or 7.5 tons per sq. in. of section. This provides for a "factor of safety" of 4, which is usually adopted in practice for structures under quiescent loading.

Moments of Resistance.

The modulus section multiplied by the modulus of rupture of the material will give the value for the "Moment of resistance." The modulus section is a fixed quantity for any given section. The moment of resistance depends upon the strength of the material of the section.

These two values, "modulus section" and "moment of resistance," are often used indiscriminately.

Bending Moments.

To carry this further necessitates the consideration of the conditions existing in loaded beams

Beams may be either supported at each end, fixed at each end, or continuous over several supports. There are also semi-beams or cantilevers fixed into a wall or support at one end only.

In this article supported beams and cantilevers only will be considered.

In Fig. 9 is shown a cantilever carrying an end load. The neutral axis is shown in dotted lines.

It is evident that this load will tend to bend the cantilever.

Assume then that it bends or turns around point "x" at the wall or support, and takes up the position as shown by "x—x." In so doing the end of the beam at the wall line would take up a position, "a—b." The point "a" turning to the right and "b" to the left. The degree or intensity of this turning or bending action is measured by the product of the weight "w," and its distance or leverage from "x." Now "w" the load multiplied by the leverage, or distance from the fulcrum "x" is known as the "moment" of "w" about "x," and since it has a tendency to turn or bend the beam, it is known as the "Bending Moment." The measure of the bending moment will be in "Foot-tons" if the load is in tons and the leverage in feet, or "inch-tons," if the leverage is in inches.

This bending moment is the force which tends to strain the beam by altering the length of its fibres or otherwise displacing them, and the "moment of resistance of the fibres about the neutral axis tends to resist the strain. So that the conditions under which loaded beams exist is a little problem in attack (bending moment) and defence (resisting moment). It is now necessary to be able to measure or calculate the amount of the bending moment.

Beginning with a simple concentrated centre load (Fig. 10), let W = the load at the centre, and "L" the total span.

In the determination of the stresses to structures, it is necessary, after having determined the loads, to find the amount of the supporting forces, and also their directions or lines of action. These supporting forces are known as the reactions, and their sum is always equal to the sum of the applied loads.

In a simple beam with a centre load it is clear that the "reactions" will be one-half of the load "w" or $\frac{w}{2}$ and their directions will be opposite to the load W. Action (W) and reaction $\left(\frac{w}{2} + \frac{w}{2}\right)$ must be equal and opposite.

(To be concluded.)

DIAGRAMS ILLUSTRATING "THE STRENGTH OF ROLLED STEEL BEAMS."

Fig. 2.

TWO NEW REINFORCING MATERIALS.

That old-established firm of reinforced concrete constructors, the Expanded Metal Co., Ltd., York Mansion, have recently introduced two new specialities on the market. The first is their "Rib Expanded Metal." The ordinary diamond-mesh expanded metal is extensively used for reinforced concrete floors, roofs, walls, tanks, silos, etc. Expanded metal has many advantages. It is very economical, and it does not get out of place, can be easily applied and conveniently handled—indeed, it is a practical reinforcement. There are, too, theoretical advantages in the diamond-mesh, and tests have shown the great resistance of diagonal reinforcement, superior to that obtained with straightway reinforcing. However, it is unnecessary for us to here refer in detail to the properties of diamond-mesh expanded metal, for they are well known and have already been dealt with in these columns. The Expanded Metal Co., Ltd. (of York Mansion, York Street, Westminster), have now another type of expanded metal somewhat cheaper than the diamond-mesh and equally serviceable for most purposes. The form of this is shown in Fig. 1, from which it will be seen that it consists of ribs running parallel, with smaller strands connecting them at right angles. This "Rib Expanded Metal" is intended for reinforcing in one direction only, but two sheets can be dispósed one on top of the other at right angles if it is desired to reinforce a slab in two directions. It is obviously a great convenience over ordinary rods for slab reinforcement to have them attached together as a sheet. They do not become displaced and are easy to lay. This is what "rib expanded metal" practically is. There are several standard meshes, made from one original section of steel, by cutting the transverse strands shorter or longer so as to allow the ribs to be opened out more or less widely. The following table give the properties of the standard meshes. It will be

No. of Mesh & Size.	Size of Standard Sheets. Width.	Size of Standard Sheets. Lengths.	Super. Feet per Lineal Foot of Standard Sheet	Sectional Area per Foot of Width.	Approx. Weight per Yard super.
Ins.	Ins.	Ft. Ins.		Sq. ins.	Lbs.
2	16	10′ 6″, 12′ 6″, 14′ 6″, 16′ 6″, 18′ 6″.	1·33	·54	17½
3	24		2·00	·36	11¾
4	32	10′ 4½″, 12′ 4½″, 14′ 4½″, 16′ 4½″, 18′ 4½″.	2·67	·27	8¾
6	48	10′ 3″, 12′ 3″, 14′ 3″, 16′ 3″, 18′ 3″.	4·00	·18	5⅞
8	64	10′ 0″, 12′ 0″, 14′ 0″, 16′ 0″, 18′ 0″.	5·33	·135	4⅜

seen that sheets up to 18ft. 6ins. long can be obtained, whereas the maximum length of the earlier type is 16ft. Also sheets need not be overlapped where they adjoin, as with the diamond type, they can be joined by means of wire clamps or dogs, spaced apart the same distance as the ribs in the sheets.

It may be mentioned also that the material forms a perfect mechanical bond, as does the diamond-mesh expanded metal.

The second innovation is an "expanded metal bar." Fig. 2 shows its form. It will be seen that it consists of a square bar attached to a sheet of expanded steel. It possesses the advantages that the expanded portion serves to reinforce a beam against shear stresses, and also serves to unite the layers of concrete as they are deposited in the beam box mould, while there is no doubt as to it providing a mechanical bond, it being impossible for such a bar to slip in the concrete, a beam therefore being made thoroughly homogeneous. Fig. 3 shows the standard sections in which the bar is made. It lends itself to many applications in general reinforced concrete practice, and tests have shown the extraordinarily high resistance that is developed by beams constructed with such a meshwork of steel throughout their depth, the concrete being confined so that it develops great compressive strength and ductility.

As the use of these new expanded metal products develops we shall have occasion to refer to them again.

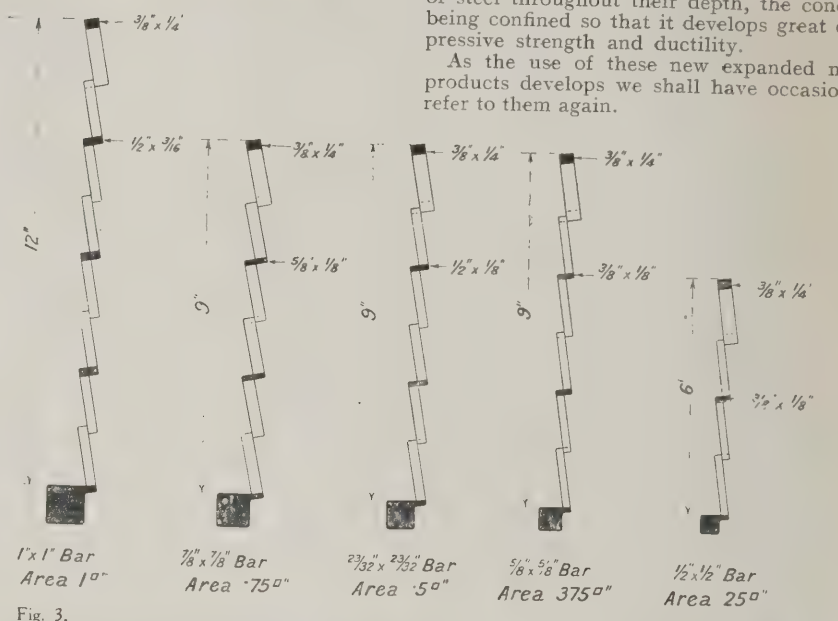

Fig. 3.

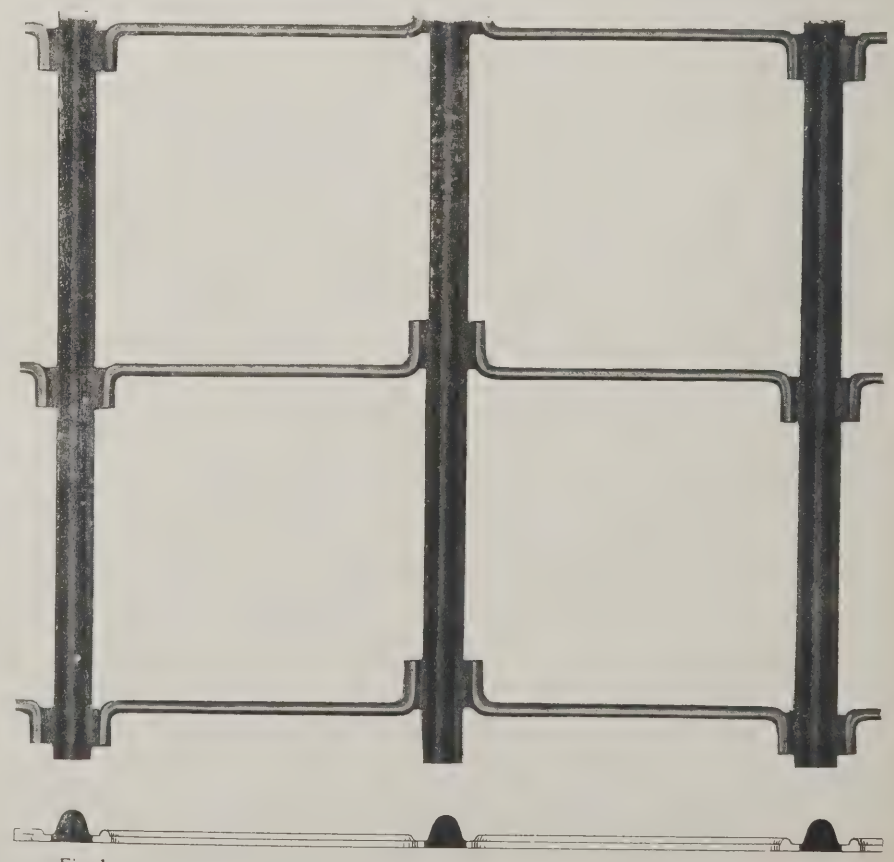

Fig. 1.

ENQUIRIES ANSWERED.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given not necessarily for publication

The Editor is willing to answer enquiries from readers who require information on architectural, constructional, or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The Editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned, but the enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies, or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s., made payable to Technical Journals, Ltd. and crossed, and stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable, and it must be understood that both question and reply will, as a rule, be published in these columns.

R.I.B.A. Probationer Examination.

R. S. J. (AMMANFORD) writes: "Kindly inform me what drawings would be suitable for geometry, perspective and freehand, for probationer examination R.I.B.A. Provided I submit satisfactory drawings I am exempt from this examination."

—Drawings of such subjects as those suggested under divisions VI. and VIII., on page 355 of the current R.I.B.A. Kalendar, would be accepted. The geometrical sheets should exhibit knowledge of the interpenetration of solids, with relation to buildings. Such examples as a mansard roof, with chimney stack, having a shadow cast by sciography, or the projection of shadows on a curved surface might be drawn if querist has no scale drawings which will serve. If he elects to submit sheets on perspective, a few examples of simple forms put into perspective and showing all the construction lines would be sufficient. A freehand drawing in pure outline, of such a subject as an Early English capital or label stop, or any plaster cast of architectural ornament, would be accepted for subject VIII. G.

The Ecole des Beaux-Arts.

F. L. (FALKIRK) writes: "I have become very interested in the Ecole des Beaux-Arts and desire to study in Paris for a time. I have heard some say it is good to go to the Ecole, to stay the three years and take the diploma, others that it is better to go for a year or eighteen months; others, again, think it sufficient to go to Paris, enter one of the ateliers without necessarily entering the Ecole at all, and that all Paris can give can be got in that way. (1) What is necessary for entering an atelier? (2) Which would you advise me to enter (3) What is the best time to go this year, say, after June? (4) What fees are required at an atelier? Kindly give any other general information."

—I can only express a general opinion upon the leading questions regarding the Ecole des Beaux-Arts; and with regard to the secondary questions, as nearly as I know or recall, speaking of things as they were five or six years ago. If the student is already a good draughtsman and sufficiently prepared to enter the Ecole, he should, by all means, take the admission examinations and become a pupil of the school, and should take the diploma course if his age and means permit of it. If he is over 27½ years of age when he has passed the admission examination, it will be impossible to obtain the diploma because of the time required and the age limit at which pupils must withdraw from the Ecole proper. He may, however, work up to the first class and gain some of the scientific as well as artistic training. It would be only to the man whose office experience—in a very good office—has exceeded five or six years, or whose circumstances would not permit of a longer stay than one year, or whose age were nearly thirty, that I would offer the advice to enter an atelier without also entering the Ecole. It is not true that "all that Paris can give can be got in that way" by any except those exceptionally gifted men who have most of "what Paris can give" before they go there. There is a good course in architecture in the making at Liverpool University. I do not think it could be compared with Paris as yet, nor do I think any English school is likely ever to compare favourably with the Ecole, for reasons too lengthy to be given here. To come to the secondary questions:—(1) and (4). (a) A preparatory atelier such as Godefroy-Freynet's, Duquesne's, or Chiffiot's can be entered by merely making formal application and paying the fees, about £2 per month. (b) An atelier in connection with the Ecole des Beaux-Arts, such as Pascal's, Daumet-Esquié's, Laloux, Redon's, Deglane's, Moyaux, etc., can only be entered if the professor is satisfied with the applicant after an interview and an inspection of some of his drawings. The student who is not a good draughtsman or who has not mastered the "orders" is not desired at these large ateliers, and would do better to go to a preparatory atelier. On the other hand, the advanced student, especially after passing the admission examinations, would get more value out of the ateliers presided over by the leading architects. To the latter there is an initiation fee of about £4, and the monthly dues, small fines, etc., run to about £2, or a little less. (2) This is partly answered by the reply to No. 1. All of the ateliers mentioned above are approximately equal. Pascal's was chosen by the writer, and if he were again beginning, it would be the one again chosen. The patron speaks English, and Englishmen and Americans are always cordially received by him. In some of the best ateliers tradition is against English students. (3) The best time to go this year will be when the flood troubles have quite passed away. The first time one gets the opportunity is always the best time to go to Paris! This is true of the Ecole also. F. S. S.

Reinforced Concrete Chimneys.

"SUSSEX" writes:—"Please give me information regarding the erection of reinforced concrete chimneys, and also advise regarding circumstances where the foundation of same is in water when a depth of a few feet is reached, but which is supposed to be on harder ground at a depth of, say, 20ft. Please state also the name and address of contractors who erect this class of chimney, and name any books on the subject."

—A paper on "Reinforced Concrete Chimneys," by Mr. E. R. Matthews, was recently read at a meeting of the Concrete Institute.

This church is to be built on the shore of False Bay, a little to the east of Table Bay. The climate being similar to that of Italy and Spain, the design is a simple treatment of Romanesque, with small windows, large overhanging eaves, and comparatively flat roofs, to give protection from the heat. The walls will be of local stone and covered with rough lime plaster; the roofs are to be covered with green slates.

and a summary was published in our columns. That paper contained a good deai of information on the subject. It recorded as a fact that in several instances reinforced concrete chimneys had been erected at less cost than brick chimneys could have been built in the same circumstances; but there may be conditions in other jobs which would render a concrete chimney uneconomical. There are several points requiring careful designing in a reinforced concrete chimney to prevent cracking. There are several firms of specialists in the United States who confine their attention to reinforced concrete chimneys only, but we know of none in this country. You might get any of the reinforced concrete specialists to design chimneys, but the following firms advertise that they undertake such structures: The Alphons Custodis Co., 119, Victoria Street, Westminster, S.W.; The Ferbeck Chimney Construction Co.; Leslie and Co., Ltd., Kensington Square, London, W.; The Patent Indented Steel Bar Co., Ltd., Queen Anne's Chambers, Westminster. As regards foundations in the circumstances referred to, we would suggest the use of reinforced concrete piles. We know of no books on reinforced concrete chimney design. D.

Constructional Steelwork Quantities.

SURVEYOR (PECKHAM) writes: "Where can I find examples of the present-day method of taking off constructional steelwork quantities in detail, such as steel grillage, foundations, build-up stanchions, plate, girders and steel roofs?"

—We do not know of any books containing information, nor any articles on the subject, though we think it probable you would be able to find a certain amount of information bearing on the subject in American books on steel frame construction. In America, however, it is customary for contractors to take off their own quantities: so that such work would be in the hands of specialists, and their estimators would not be likely to write any special treatises where there was little or no demand. We can only suggest that the usual practice of quantity surveyors in this country should be followed, the labours all being recorded in detail; but the usual procedure seems to be to give the work to a specialist, inserting a provisional sum for the steelwork in the bill of quantities, or to provide the builder with prints of the detail drawings so that he can send to specialist firms for prices. D.

Percentages off Quantities.

E. H. D. (LONDON) writes: "A builder executes work under contract with quantities supplied. In order to secure the contract 10 per cent. has been taken off at the end of the priced bills in which are included about £2,000 net provisions.

"The builder in rendering an account of the variations takes off 10 per cent. on the omissions side, but carefully excludes the 10 per cent. on the amounts spent on provisional work.

"Thus, for an electric lift, £300 net is provided and £247 spent.

"The builder by taking off 10 per cent. in the bills reduces the provision to £270, and my clients, instead of saving £53, only get a deduction of £23.

"Am I not legally entitled to take 10 per cent. off both additions and omissions?

"It seems to me the 10 per cent. is the builder's loss, and should not come out of my client's pocket."

—If the usual practice has been followed and the builder deposited with the architect, the fully priced bills of quantities showing how the sum total of his estimate was arrived at, the question of the 10 per cent. discount taken off the bills at the end should have been raised then and settled before the priced schedule was accepted. That opportunity having apparently been allowed to pass, it may now be sought to set up the contention that the £2,000 provisional sum was in fact reduced by 10 per cent. at the outset by the consent of those who provided it. If this contention cannot be sustained, and we do not think it would be, the variations from the original bill should be ascertained, and a final amount arrived at as the total final cost of the job, and from this sum 10 per cent. discount should be deducted exactly as was done in the original tender; the net amount so ascertained would be sum due to the contractor. A. G. W.

Tiles for Mill Floors.

C. K. (BELFAST) writes: "Please furnish us with the names of the makers of tiles for mill floors. I believe they are made in Belgium and are exceedingly hard, white in colour, and the surface is slightly corrugated, so that bare-footed workers can walk comfortably without slipping. The tiles are apparently something like the white vitreous tiles which are made in Staffordshire, only that the latter are much thinner, being only ½in., whereas these Belgian tiles are about 1in., or perhaps even 1¼in. They are, I believe, less per super yard than the white vitreous tiles made for tessellated floors in this country."

—Unfortunately I cannot give you the name of any maker of mill floor tiles as described, though I believe they are of Belgian and not German manufacture. In any case it would scarcely pay to import them unless for any very special purpose. Your best plan would be to write to the Towers Admantine Tile Co., Little Bytham, Grantham, telling them of your requirements, and asking for a quotation for tiles to your design made in their buff paving material.

Unless colour is of very great importance you will find the material supplied by this firm to be fully equal in durability to that of the German article, and you will save considerably on the carriage. It will prove much cheaper per super yard if the tiles are made 9in. × 9in., unless this firm happens to have 6in. moulds in stock. For cleanness, non-slipperiness, and general convenience you will find nothing more suitable for mill floors than a really well-made concrete floor, surfaced with a coarse sand to which is added plenty of cement.

A.B.S.

Foreman's Three-quarter Time.

A. B. C. (TORQUAY) writes: "Is a builder, whilst carrying out a contract, the work being in full swing, justified in charging his foreman's time, in addition to ¾ to the workmen's, in any variation or addition that may be ordered by the architects, the building agreement stipulating that a competent foreman shall always be employed or kept upon the works?"

—If the variations or additions are to be measured and paid for at the rates given by the contractor in the priced bill of quantities which formed the basis of the original contract, or are to be charged for by the contractor at the usual day-work prices prevalent in the district, in either case the charges should be deemed to cover supervision, and the contractor would not be justified in charging the time of his foreman. If no priced quantities have been deposited the principle would still hold good that the original lump sum contract included supervision, and that variations and additions must ultimately be determined either by their proportionate relation to the original amounts provided by the contractor in his contract for the execution of the work varied; or, if a new kind of work is added, at fair measure and value; or, be determined by day-work prices usual in the district. If some other basis of payment has been imposed on the contractor by the contract, then it will depend upon the conditions whether a charge for a foreman is justifiable. For instance, where the contract only allows a ten per cent. margin over the cost of labour to cover profit and supervision, such a charge would be justifiable and demandable unless expressly barred by the contract. A. G. W.

Staffordshire Type of School Plans.

A. A. R. (BOWES PARK) writes: "Kindly inform me where particulars and plans, etc., of 'the Staffordshire' plan of a verandah on one floor, having one hall only for the two departments can be obtained? This is the recommended arrangement for the Acton school competition."

—Plans and section of a school of the Staffordshire type were published in the Journal of the Architectural Association for March, 1909, in illustration of a paper by Mr. H. T. Buckland, which also gives further particulars of the type. Copies of the Journal can probably be obtained at the Architectural Association, 18, Tufton Street, S.W., price 6d. each. G.

Domestic Hot-water Apparatus.

D. W. W. (SIDCUP) writes: "In your issue of February 2nd you give on page 91 a simple diagram illustrating the general arrangement for domestic hot-water apparatus. Will you kindly advise me whether in view of the 'expansion pipe' it is in any way desirable to fit a safety valve to the boiler?"

—Yes, it is desirable. The expansion pipe is not a substitute for the safety-valve. When water is heated, it swells, and unless space be provided for this swelling, pressure is put on all the material, and the weakest portion may give way. No hot-water supply installation of ordinary strength can work without an expansion pipe (sometimes called a "steam escape" or "air vent"), whilst it can work without a safety-valve. The duty of a safety-valve is to relieve the boiler (the greatest mass of hottest water) of any extra pressure put on it by a stoppage of the pipes, ice in a distant part of the pipes being the chief apprehension. INGENIOR.

Buildings to Measure near Sidcup.

E. E. B. (SIDCUP) writes: "Could you advise me as to good subjects for the Gothic sheets for the R.I.B.A. Intermediate Examination, near Sidcup?"

—Stone Church (1251-1274), near Greenhithe, has some of the most beautiful Early English work in the country. A portion of the wall arcade round the chancel, one of the aisle windows, or a bay of the nave arcade could not be improved upon as a subject for one of the measured sheets; and for the "Mediæval Ornament" one of the carved spandrels in the chancel, or a capital from the nave would be equally good. An example of Perpendicular work may be taken from Eltham Palace, say the doorway to the hall, which is accessible. G.

Nicholson's "Dictionary of the Science and Practice of Architecture."

G. H. (NORWICH) writes: "I have two volumes of Peter Nicholson's 'Dictionary of the Science and Practice of Architecture,' size of each about 11ins. by 9ins by 2½ins., well bound in leather covers and gilt edges. Kindly let me know the value of these two volumes, and the most likely market, should I feel disposed to part with them."

—Nicholson's work is only worth about 7s. 6d., and, as there is at present no demand for this book, it would be advisable to take any price that the ordinary bookseller might offer. B.

Braced Collar Beam Roof.

"COMPASS" (HAMMERSMITH) writes: "I shall be glad of your advice regarding the enclosed sketch (not reproduced) of roof, and to know (1) whether roof and buttress are sufficient to resist pressures and would be safe; (2) whether any dimensions could be safely reduced. It is proposed to use Oregon pine for the circular trusses. I have approximately shown the pressures on buttress following your illustration in your issue of Jan. 27, 1909."

—The truss submitted appears to be just strong enough and the buttresses sufficient. None of the scantlings can be reduced. The tee straps to collar beam should not be less than 2½ins. by ⅜in. HENRY ADAMS.

NOTES ON COMPETITIONS.

Usher Hall, Edinburgh.

Architects from all over the country have signified their intention of forwarding plans for the erection of the Usher Hall in Lothian Road, Edinburgh, the applications almost reaching 100. The arbiter is Sir Aston Webb, London, who will have associated with him in adjudicating on the designs submitted, Mr. James A. Williamson, the city architect.

LIST OF COMPETITIONS OPEN.

APRIL 23. COUNTY OFFICES, NAVAN. Particulars given in our issue of March 16th.

MAY 2. STOCKPORT NEW LIBRARY. Architects desirous of competing for the designs of the library which the corporation propose to erect are invited to send their names, with information as to their experience in and qualifications for carrying out such work, to the undersigned on or before Monday, May 2nd, 1910. From the names sent in the corporation propose to select a number to compete for the work. Canvassing will be regarded as a disqualification. Robert Hyde, Town Clerk, Town Hall, Stockport.

MAY 31. MUNICIPAL OFFICES, KARACHI. Particulars given in our issue March 16th.

JUNE 11. COVENTRY. ENLARGEMENT OF SCHOOL at STOKE. Limited to Architects practising in Coventry. Particulars given in our issue of March 16th.

JUNE 15. ELEMENTARY SCHOOLS, ACTON. Particulars given in our issue of March 16th. The Royal Institute of British Architects has requested architects not to compete.

AUGUST 31. COVENTRY. NEW ELEMENTARY SCHOOL in Centaur Road. Limited to Architects practising in Coventry. Particulars given in our issue of March 16th.

NO DATE. PROPOSED USHER HALL, EDINBURGH. Particulars given in our issue of April 20th. Inquiries to be addressed to Thomas Hunter, Town Clerk, City Chambers, Edinburgh.

NEW BUILDINGS.

PROPOSED.

Darnall (Sheffield).—At the school in Whitby Road, which was erected last year to accommodate 810 pupils, and cost (inclusive of site) £1,200, the Sheffield Education Committee has given notice that they intend to erect a third department as planned in the original scheme. The addition will accommodate 400 pupils, and is estimated to cost about £5,000.

East Grinstead.—The Urban District Council has decided to make an application to the Local Government Board for permission to borrow the sum of £1,800 for the purpose of purchasing a site on which to build Council offices, fire brigade station, Collector's Offices, stable and depot.

Elgin.—The Burgh school board have decided upon an expenditure of £2,500 in providing additions and making alterations at the Academy.

Girvan.—The Town Council has agreed to borrow the sum of £3,040 on permanent loan, to pay the cost of the site of the new Town Hall, and £1,000 for street improvements.

Hammersmith.—At the Hammersmith Town Hall, Mr. H. R. Hooper, M.Inst.C.E., has held a Local Government Board enquiry into an application made by the Hammersmith Borough Council for sanction to the borrowing of a further sum of £11,462 in respect of the public baths and washhouses in Lime Grove, Shepherd's Bush.

Hanley (Staffs.).—A scheme is now taking definite shape to erect a new church in the parish of All Saints, at a cost of about £6,000.

Hendon.—It has been decided to proceed with a scheme for the enlargement of the parish church of Hendon, at a cost of £6,000.

Inverkeithing.—Plans for the extension of Inverkeithing Gasworks, which is estimated to cost at least £1,500, have been passed by the Dean of Guild Court. It is proposed to erect a new gasholder capable of holding 25,000 cubic feet of gas, and buildings and appliances.

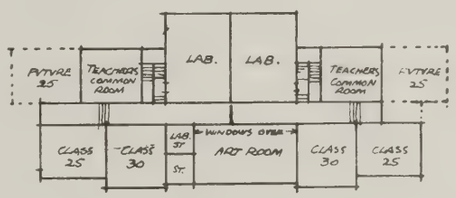
Kilmarnock.—It is proposed to build a new church at Kilmarnock at a probable cost of between £1,500 and £1,600.

Liverpool.—At a recent meeting of Liverpool Masonic brethren, in the Masonic Hall, Hope Street, it was unanimously decided to adopt plans for the extension of the existing hall, at an estimated expenditure of £9,000.

London.—The London and South-Western Railway Company has submitted to the Lambeth Borough Council plans of four blocks of working-class dwellings, to be erected in the vicinity of Waterloo, to house persons displaced by the station extension scheme, and which necessitated the demolition of several streets and courts.

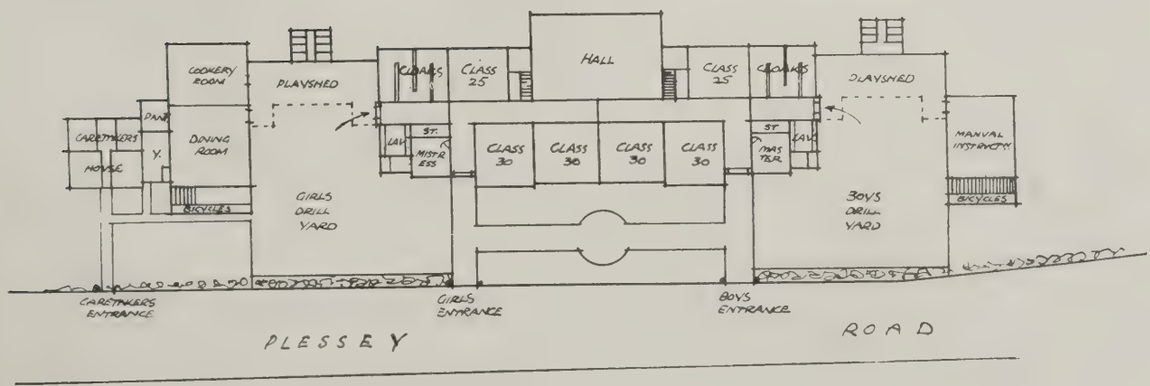
Nidd.—At a recent Consistory Court, held at Ripon Cathedral, a faculty was granted to the vicar and churchwardens of Nidd, authorising the building of a new north aisle, the enlarging of the vestry and organ chamber, and making other alterations in the parish church, which, it is estimated, will cost between £1,300 and £1,400.

Paisley.—At a recent meeting of Paisley Town Council, it was stated that it was intended to construct a new reservoir at Rowbank, near Howwood, at a cost of between £40,000 and £50,000.



Salford.—Mr. M. K. North, Local Government Board inspector, has held an inquiry at Salford Town Hall into the application of the Corporation for permission to borrow £16,690 for the purpose of providing an annexe to the Town Hall and the making of other alterations.

Southend-on-Sea.—A syndicate has purchased the Kursaal, and will spend £50,000 on the building and grounds.



IN PROGRESS AND COMPLETED.

Ayr.—The Ayr Dean of Guild Court has passed the plans for alterations at St. Leonard's parish church and the erection of a hall at a cost of £2,100, and for the erection of a church hall and vestry by Wallacetown United Free Church at a cost of £1,000.

Banff.—The foundation stone of the new Higher Grade School, which is in course of

FIRST FLOOR PLAN

GROUND PLAN

The chief difficulty was to provide the whole of the accommodation for the stipulated sum of £7,000. It was suggested in the conditions that one laboratory and the art room could be omitted to bring the estimate down to the figure mentioned. Both however are included in this design, the estimated cost of which is £7,027.

BLYTH SECONDARY SCHOOL COMPETITION: OUTLINE PLAN OF SELECTED DESIGN. EDWARD CRATNEY, ARCHITECT

erection at an estimated cost of £6,500, has been laid, Mr. Arthur Clyne, F.R.I.B.A., Aberdeen, being the architect.

Birmingham.—The foundation stone has been laid of a new edifice to take the place of St. Stephen's Church, Newton Row, which was demolished by order of the Municipal authorities. The new church, designed by Mr. W. H. Bidlake, M.A., will cost £6,500 to complete, but a commencement is being made with the chancel, two bays of the nave, vestries, organ chamber, etc., at a cost of about £4,800.

Cardiff.—The extension to the Cardiff Y.M.C.A. buildings in North Edward Street, is in course of erection, and the foundation stones were recently laid. The architects are Messrs. Speir and Beavan, and the cost of the extension will be £4,200.

Gateshead.—The enlargements to St. Chad's parochial buildings, in Westminster Street, are in progress at a cost of £2,000, and the foundation stone was recently laid. The architects are Messrs. Hicks and Charlewood, and the contractor Mr. W. Hall, Gateshead.

Guildford.—The new Holy Trinity parish hall, which has been opened by the Princess Christian, has cost over £3,000, Mr. E. L. Lunn being the hon. architect. The building is of red brick, with dressings of Bath stone, and the large hall, which is 70ft. long, by 26ft. 6ins. wide, will accommodate 260 persons.

Leeds.—The new Congregational Church at the junction of Sheepscar and Barrack Streets, has been completed from the designs of Mr. G. F. Darby, architect, at a total cost of about £3,070. The building is of brick, with stone dressings. On the ground floor is a school-room that will seat 400, and above is a mission hall and gallery to seat 500.

Long Eaton.—The Urban District Council has accepted Messrs. Johnson and Langley's tender of £3,629 5s. 10d. for the erection of Sawley Road bridge, and also Mr. J. Tomlinson's tender of £1,269 0s. 8d., for the Derby Road bridge improvement.

Newcastle.—The vicar and churchwardens of St. John's Church are about to erect a new school at a cost of £3,500, on the site of the present infant school in Bath Lane.

Paisley.—The Town Council has resolved to accept the plans submitted by Sir William Arrol and Co. for the new bridge to be erected at Carlile Quay, at an estimated cost of £2,240. The bridge will connect the northern districts of the town meantime, separated by the river Cart. The work of widening the Sneddon Bridge, one of the main thoroughfares of the town, is now practically completed, and the bridge will shortly be opened for vehicular traffic.

St. Albans.—The new church dedicated to St. Paul, has been erected at a cost of £7,400, and provides seating accommodation for 700 persons.

South Shields.—The new hall and Sunday school in connection with St. Michael's Church, Westoe, which has been erected at a total cost of £3,603, has been opened on completion, the architect being Mr. H. Grieves, A.R.I.B.A., and the contractor Mr. J. Christie.

PRACTICAL NOTES.

On Tarring Roofing Tiles.

The tarring of roofing tiles has been much to the fore amongst builders lately, because the sharp winter weather has caused many tiles to shed some of the tarry coating and has, in consequence, caused the very trouble the tarring was intended to avoid.

If tiles used for roofing are sufficiently well burned to be but slightly porous, there is no need for tar, but the difficulties of producing tight tiles are many, and there are large numbers of tiles on the market which are soaked by a few minutes' rain. Such tiles, when subjected to a heavy downpour, rapidly become very wet on the underside and may even allow the water to drop from their undersurface. It is then necessary to coat them with some impervious material, and tar is frequently used on account of its cheapness and the ease with which it may be applied.

The durability of the tar-coat depends greatly on the nature of the tar itself. Gas-tar is generally too deficient in light oils to be satisfactory, and asphalt-tar or bitumen, when it can be obtained, is far more adhesive, as it penetrates more completely into the pores of the tiles.

It is also important that the tiles should be hot when tarred, as otherwise they chill the tar so that it does not penetrate properly and easily shells off when exposed to changeable weather or rain. For the most effective penetration the tiles should be taken hot out of the oven or kiln and dipped at once. If they have been allowed to cool they should be reheated until almost of the temperature of boiling water before dipping. Many manufacturers object to dipping the hot tiles as they are so difficult to handle, but there is no comparison between their durability and that of tiles dipped when almost cold.

Needless to say, the tar itself should be at least as hot as the tiles, and it is, usually, better to have it rather hotter, so that it does not become unduly cooled when the tiles are being dipped.

The present writer was recently consulted as to the cause of a number of tiles peeling badly, and on investigation it was found that they had not been cleaned previous to tarring, with the result that the tar had adhered to dust and sand on the tile, but not to the true surface of the tile itself. Before tarring all tiles should be brushed with a stiff or wire brush, so as to remove any loosely adhering particles.

From what has just been stated it will be clear that to tar tiles when the latter are on the roof is never likely to be satisfactory, and as the cost of taking them off and replacing them is considerably more than most people care to contemplate, great care should be taken to purchase the hardest burned and least porous tiles in preference to more porous ones, the difference in price being comparatively unimportant. Most tile-makers will gladly produce harder tiles if desired, but they are rather more expensive as more fuel is needed in burning.

TRADE AND CRAFT.

Gas Lighting for the West End.

The Westminster City Council have decided to place a contract with the Gas Light and Coke Co. for the lighting of Regent Street, Piccadilly Circus, St. James's Street and Pall Mall by the latest form of high-pressure gas-lamp, in place of the existing electric arc lamps. Especial interest attaches to this decision from the fact that Pall Mall was the first thoroughfare in the world to be lighted by gas—the original lamps being installed more than over one hundred years ago. The inverted mantle has evidently given the centenarian light a new lease of life. It will be remembered that the screen in front of Buckingham Palace is now lighted by high-pressure gas lamps, which also throw their searching light upon the pressman's labours in Fleet Street. The decision of the Westminster Council (which also provides for the improved gas lighting of Victoria Street and many other thoroughfares in the City by inverted burners) was based upon the fact that the tenders received from the gas and electricity companies revealed a difference of from 30 to 80 per cent. in favour of gas, light for light.

A White Distemper for Ceilings and Friezes.

The paste form of distemper offers many advantages. From it the wash is easily and satisfactorily prepared, and the application is without fuss or mess, the distemper assuming more of the consistency of paint, and flowing from the brush with almost the same degree of agreeable smoothness, rather than in the spatterdash manner of whitewash. "Ceelinkoto," which is a white distemper in paste form, renders the old wasteful and troublesome method of preparation entirely obsolete. All that is necessary in order to obtain an excellent whitewash for ceilings and friezes is to add to the paste a little clean cold water. We understand that it is free from animal size, and there is therefore no disagreeable smell, and obviously the absence of an element of decay makes for health as well as for cleanliness and sweetness, and thus yet another of the causes of the ordinary householder's strong reluctance to enter upon the disagreeable business of whitewashing is entirely overcome. "Ceelinkoto," which is manufactured by Messrs. Thomas Jenkins and Co., St. George's Wharf, Grand Surrey Canal, Camberwell, S.E., is not an untried product, but has already acquired a high reputation among builders and decorators, who find that it saves time, labour, and waste, and gives satisfaction to the client.

The business of the "Zeta" Wood Flooring Company, Ltd., has been purchased outright from the Receiver and Manager, but the change is only proprietary as Mr. William J. Bennett retains the general management of the new company, and will have the same executive staff associated with him as since the foundation of the old company in 1907.

COMING EVENTS.

Friday, April 29.

ARCHITECTURAL ASSOCIATION.—Mr. Mowbray A. Green on "The Architecture of Bath." Election of officers. 7.30 p.m.

ROYAL SANITARY INSTITUTE.—Provincial sessional meeting, at the Guildhall, Worcester. Dr. G. N. Woollatt, on "The Teaching of Sanitary and Domestic Science in Schools." Mr. W. Ransom on "Building By-laws Reform," 7.30 p.m.

Saturday, April 30.

ROYAL SANITARY INSTITUTE.—Provincial sessional meeting at Worcester. Visits to local factories and public works.

R.I.B.A.—Last day for receiving applications for preliminary examination (June), also applications and testimonies of study for Intermediate Examination (June).

Monday, May 2.

R.I.B.A.—Annual general meeting.

ROYAL SOCIETY OF ARTS (Cantor Lecture).—Mr. A. B. Searle on 4th and concluding lecture on "Modern Methods of Brick-making," 8 p.m.

THE SOCIETY OF ENGINEERS.—Mr. R. O. Wynne-Roberts, on "Up-to-date Roads," 7.30 p.m.

Wednesday, May 4.

R.I.B.A.—Art Committee meets.

Thursday, May 5.

ARCHITECTURAL ASSOCIATION.—Members' dinner.

Friday, May 6.

ARCHITECTURAL ASSOCIATION DEBATING SOCIETY, 7 p.m.

Saturday, May 7.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Visit to Newliston.

R.I.B.A.—Issue of voting papers; election of Council and Standing Committees; publication candidates for membership, June 6th election.

MUNICIPAL AND HEALTH EXHIBITION.—Royal Agricultural Hall, London; opens and continues to May 14th.

Tuesday, May 10.

R.I.B.A.—Practice Committee meets.

Thursday, May 12.

R.I.B.A.—Science Committee meets.

Friday, May 13.

R.I.B.A.—Last day for receiving applications and testimonies of study for June final examination and probationary work for special examination.

Saturday, May 14.

MUNICIPAL AND HEALTH EXHIBITION.—Royal Agricultural Hall, London, closes.

Monday, May 16.

Whit-Monday.—Bank Holiday.

Thursday, May 19.

R.I.B.A.—Literature Committee meets.

Saturday, May 21.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Visit to Broomhall, Fife.

R.I.B.A.—Last day for receiving notices of questions for discussion at meeting on June 6th.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about **five days** or longer after the date of this issue.
Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders.
The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the Contract, which requires them to pay the rates of wages current in the district.

BUILDING

April 9—May 3. **DEPTFORD.**—Erection of a branch library on the site in New Cross Road, S.E., for the Corporation, according to the drawings and specification prepared by Castle and Warren, Architects, and to be seen at their offices at Talbot House, Arundel Street, Strand, W.C. Persons intending to tender were to send in their names to the Town Clerk so as to be received by him on or before Saturday, April 9, 1910, accompanied by a deposit of £2 2s. Bills of quantities, prepared by Dow, White, and Gee, of 12, Craven Street, Strand, W.C., together with the conditions of contract, would then be forwarded. Tenders must be delivered to the Town Clerk at the Town Hall, New Cross Road, S.E. The contractor will be required to subscribe to the wages clause embodied in the conditions of contract.

May 1. **ST. GERMANS (King's Lynn).**—New Wood Top to St. Germans Bridge crossing the River Ouse. For further particulars apply The Bridge Reeves, St. Germans, King's Lynn.

May 2. **BIRKENHEAD.**—Repairs, alterations and painting for the Hospital Committee. Quantities may be obtained from Edmund Kirby and Sons, architects, 5, Cook Street, Liverpool.

May 2. **MILNSBRIDGE.**—Erection of additions to the premises of the Milnsbridge Perseverance Co-operative Society, Ltd. Plans may be seen, and quantities obtained, at office of P. Taylor and Co., architects, Milnsbridge.

May 2. **BLACK PARK, Near Chirk.**—Re-roofing, renovating, etc., of the church. For particulars apply to J. Roberts, 2 or 11, Halton Terrace, near Chapel. Tenders to be sent to Thos. E. Parrish, Halton Cottages, near Chirk.

May 2. **SALFORD.**—Erection of a covered way to connect the Municipal secondary school for girls and the Educatien Office, for the Education Committee. Specification and drawings may be obtained from the Director of Education, Education Office, Chapel Street, Salford.

May 2. **YSTRAD (Rhondda).**—Alteration and extension of premises at Ystrad, Rhondda, for the Pentre Conservative Club. Plans and specification can be seen at the offices of J. Rees, architect, Pentre. Tenders to be addressed to "Chairman of Committee," Conservative Club, Pentre.

May 2. **PONTYPRIDD.**—Alterations and additions to Trallwn Bakery, Trallwn, Pontypridd, for Hopkin Morgan. Plans and specification can be seen and bills of quantities obtained on deposit of £2 2s. Tenders to be sent to A. O. Evans, Williams, and Evans, Architects, Pontypridd.

May 2. **BISHOP AUCKLAND.**—Erection and completion of detached villa, stable, etc., at Evenwood, near Bishop Auckland, for Dr. R. A. Milne. Drawings, specifications, and conditions of contract may be seen and quantities may be obtained, at the architect's office, 22, Durham Road, Blackhill, Co. Durham, to which address tenders must be sent.—G. Thos. Wilson, architect.

May 2. **LONDON.**—Erection of stables in Scotland Yard, for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to Sir Henry Tanner, I.S.O., at H.M. Office of Works, Storey's Gate, London, S.W. Bills of quantities and forms of tender may be obtained at the same address on deposit of £1 1s. Tenders must be delivered, addressed to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

May 2. **HUNTLY.**—Mason, carpenter, glazier, smith, plumber, plasterer, asphalter, and slater works of proposed addition to the Higher Grade School, Gordon Schools, Huntly, for the School Board. The plans and conditions of contract may be seen with John Dickson, Solicitor, Clerk to the School Board, Huntly, and Kelly and Nicol, architects, 367, Union Street, Aberdeen. Schedules of quantities may be obtained from the architects. Tenders are to be lodged with Mr. Dickson.

May 2. **HANDSWORTH (Stafford).**—Erecting a mess room, cottage, etc., at the Cemetery, Camp Lane, for the U.D.C. Conditions of contract, drawings, and specification may be seen and bills of quantities and forms of tender obtained on application to H. Richardson, A.M.Inst.C.E., Engineer and Surveyor to the Council, Council House, Handsworth, Staffs., to whom tenders must be sent. The Contractor will be required to pay not less than the recognised standard rate of wages current in the district.

May 2. **ABERDEEN** (Haddo House Estates).—Mason, carpenter, and slater works of the following buildings:—Parish of Tarves: (1) Netherwoodhill (Wm. Hill), new steading; (2) Milton of Fochel (John Milne), double byre; (3) North Quilquox (John Will), new steading; (4) Little Meldrum (Alex. Davidson), double byre and shed; (5) Couchercairn (George Rennie), double byre; (6) South Quilquox (Mrs. Simmers), barn, stable, etc.; (7) Craigdam (Rev. D. Mackenzie), new steading.—Parish of Methlick: (8) Wardford (D. Davidson), new steading; (9) Flinthills (Wm. Massie), new steading; (10) Belnagoak (James Taylor), dwelling-house; (11) Middlemuir (James Gordon), double byre and sheds; (12) North Newmill (R. Ironside), new stable; (13) Newton (R. Sangster), new steading.—Parish of New Deer: (14) South Mains of Auchreddie (Wm. Bain), double byre and sheds. Plans, etc., may be seen with the tenants, and at the Estate Office.

May 2. **LUTON.**—Erection of school buildings to accommodate 350 children on Beech Hill, Dunstable Road,, for the B.C., in accordance with plans, specifications, and conditions of contract, which have been prepared by J. R. Brown and Sons, Architects, Castle Street, Luton, and which may be inspected at their offices. Bills of quantities and forms of tender may be obtained from the Secretary to the Committee, Town Hall, Luton, on deposit of £1 1s. Deposits must be made by cheque payable to the Corporation of Luton (Education Account) and crossed "Messrs. Barclay and Company, Limited, Luton Bank," or particulars will not be sent. The person whose tender is accepted will (subject to the consent of the Local Government Board to the necessary loan being obtained) be required to enter into a bond with approved sureties to an amount of £2,000, for the due performance of the contract. Tenders are to be delivered to Bruce Penny, Town Clerk, Town Hall, Luton.

May 3. **ABBEYLEIX.**—Erection of 30 labourers' cottages and fencing plots under the 10th improvement scheme, for the R.D.C. Forms of tender, plans, specifications, and other particulars can be had on application at the office of James Finnegan, Clerk to Council, Clerk's Office, Workhouse, to whom tenders must be sent.

May 3. **WORLINGTON.**—Erection of a new two-arch bridge over the Little Dart River, for the Southmolton R.D.C. The plan, etc., may be seen, and form of tender obtained, on application to Ware, Stuckley Arms, Worlington, or at the office of Fred Day, Clerk to the Council, and any further particulars obtained of W. S. Gardner, surveyor, Chittlehampton.

May 3. **NEWCASTLE-ON-TYNE.**—Erection of 10 cottages, Woodthorne Road, for the directors of the North-Eastern Railway. Plans and specification may be seen, and quantities and further information obtained upon application to William Bell, the company's architect, Central Station, Newcastle-on-Tyne. Quantities supplied on personal application to parties tendering for the whole of the works. Tenders to be sent to R. F. Dunnell, Secretary, York.

May 3. **BRENTFORD.**—Erection of a cottage in Clifden Road, Brentford, adjoining the Public Baths, for the U.D.C. Forms of tender and bills of quantities may be obtained, and the plans, specification, and conditions inspected, at the office of J. W. Croxford, the Engineer and Surveyor to the Council, Clifden House, Boston Road, Brentford, on deposit of £1. Tenders to be delivered at the Clerk's Office, Clifden House, above mentioned. The person whose tender is accepted will be required to pay not less than the trade union rate of wages current in the district.

May 3. **GLASGOW.**—Work in connection with the reconstruction of Glasgow Justiciary Courts, for the Glasgow Court-Houses Commissioners, viz (1) excavator, mason, brick, etc., works; (2) carpenter, joiner, and glazier works; (3) slater work; (4) plumber work; (5) plaster work. Drawings and general conditions of contract may be seen at the Glasgow Justiciary Buildings, entering from No. 1, East Clyde Street. Schedules of quantities may be obtained from Robert Scott and Son, measurers, 115, Wellington Street, on deposit of £4 4s. for each of the schedules for mason and joiner works and £2 2s. for each of the schedules for other works. Tenders must be addressed to W. Boyd Anderson, Clerk to the Glasgow Court-Houses Commissioners, 137, St. Vincent Street, Glasgow.

May 4. **SNAILBEACH.**—Stripping and re-slating the roof and other repairs to the Primitive Methodist Church. Specifications and all particulars to be obtained from Rev. Gervase Hall, Minsterley, to whom tenders are to be sent.

May 4. **MOORTHORPE.**—Erection of shop, warehouse, and house at Moorthorpe for the Pontefract Industrial Society (Limited). Forward names to Garside and Pennington, Architects and Surveyors, Pontefract and Castleford, when bills of quantities will be sent.

May 4. **MANCHESTER.**—Alterations to the boiler-house at the Swinton schools, for the Guardians. Bills of quantities may be had from the office of A. J. Murgatroyd, Architect, 23, Strutt Street, Manchester, upon deposit of 10s. 6d. Tenders to be delivered to James Macdonald, Clerk to the Guardians, Poor Law Offices, New Bridge Street, Manchester.

May 4. **CAMBRIDGE.**—Erection of two cottages in Albion Row. Plans and specification may be seen at the office of the Surveyor, Guildhall, where further particulars, together with form of tender, may be obtained. Tenders to be sent to J. E. L. Whitehead, Town Clerk, Guildhall. The contractor will be required to enter into an agreement for the due performance of his contract.

May 4. **WANSTEAD.**—Erection of a foreman's cottage at the Wansted Sewage Farm, Empress Avenue, Manor Park, for the U.D.C. Copies of plans and specification can be obtained on application to the Surveyor, C. H. Bressey, Council Offices, Wanstead, N.E., on deposit of £1. Tenders to be delivered at the Council Offices, Wanstead, N.E. For terms of payment and other conditions, see draft contract, which can be inspected at the Council Offices during office hours.

May 4. **ANGLETON AND PARC GWYLLT** (Glamorgan).—The following works, for the Committee of Visitors of the Glamorgan County Asylum:—(1) Alterations and additions to slaughter-house at Angleton Asylum; (2) Alterations to and re-slating cowhouse at Parc Gwyllt Asylum; (3) alterations to stables for isolation boxes at Parc Gwyllt Asylum; (4) conversion of cart shed into stables and fodder store. Specifications, bills of quantities, and forms of tender may be obtained from W. E. R. Allen, Clerk to the Committee of Visitors, Glamorgan County Council Offices, Westgate Street, Cardiff, and drawings may be seen at the office of the architect, P. J. Thomas, Bridgend, or at the Glamorgan County Offices, Westgate Street, Cardiff. Tenders must be addressed to the Clerk to the Visitors.

May 5. **SOUTHPORT.**—Alterations and additions required at their offices, Portland Street, Southport, for the Southport, Birkdale, and West Lancashire Water Board. Drawings may be seen and a copy of the specification and form of tender obtained at the offices on deposit of £1 1s. Tenders to be sent to Alleyne Brown, clerk, 11, St. George's Place, Lord Street, Southport.

May 5. **GRANGE-OVER-SANDS, etc.**—Erection of three houses (whole or separate trades) in Fernleigh Road, Grange-over-Sands, for W. J. Graham; fourteen houses, of Fernleigh Road, for Mrs. Entwisle, forming front street and two back streets and sewers, for Mrs. Entwisle; erection of a bungalow in Kentsford Road, Kents Bank, for L. P. Chapman. Plans for the whole of the above may be seen, and quantities obtained, at the offices of Settle and Brundit, A.R.I.B.A., architect, Ulverston and Barrow-in-Furness. Tenders to be delivered to the architects.

May 6. **HENSALL, etc. (Yorks).**—Whole or separate tenders for the following works, viz.:—Hensall Council School: Alterations and additions; Denby and Cumberworth Birdsedge proposed Council School: builder, jointer, slater, plumber, plasterer, painter for the West Riding Education Committee. Plans may be seen and specifications with quantities obtained on application to the Education Architect, County Hall, Wakefield. A deposit of £1 in each case must be sent by separate letter to the West Riding Treasurer, County Hall, Wakefield. Tenders must be addressed to the Clerk of the County Council.

May 6. **LONDON FOR SKATERAW (Haddingtonshire).**—Construction of a lifeboat timber slip, about 87ft. in length, upon a site on the foreshore adjacent to the life-boat station thereat for the National Lifeboat Institution. Plans and specification may be inspected on application to the local Hon Secretary, W. Bertram, Kilmaide, Dunbar, or at the office of the engineer and architect to the Royal National Lifeboat Institution, W. T. Douglass, M.Inst.C.E., 15, Victoria Street, Westminster, S.W., from whom copies of the bills of quantities and form of tender may be obtained on application, accompanied by a deposit of £1. Copies of certain of the plans will be supplied by the engineer and architect at a cost of 2s., which sum is non-returnable. Tenders are to be delivered to the Secretary of the Royal National Lifeboat Institution, 22, Charing Cross Road, London, W.C.

May 6. **PENSHAW.**—Building of ten houses, situate behind Burn Terrace, Shiney Row, Penshaw Station, for Messrs. Chesney. Plans and specifications can be seen at Mr. Palliser, Architect's Office, Philadelphia, Lime Depot. Tenders to be sent to T. J. Jeffery, Store House, Newbottle, Fence Houses.

May 6. **DENBY, etc.**—Whole or separate tenders for Denby and Cumberworth Birdsedge proposed Council School (builder, joiner, slater, plumber, plasterer, painter), for the West Riding Education Committee. Plans may be seen, and specifications, etc., obtained, on application to the Education Architect, County Hall, Wakefield. A sum of £1 must be sent by separate letter to the West Riding Treasurer, County Hall, Wakefield.

May 6. **LLANELLY.**—Erection of a new Post Office for the Commissioners of H.M. Works and Public Buildings. May 4. **NAAS.**—Construction of pipe sewers, manholes, flush tanks, storm overflows, lamp holes, fences, filters, septic tanks, and concrete effluent carriers, the preparation including under drainage of about half a statute acre of land for irrigation ground, and other works, in strict accordance with plans and specification prepared by the Council's Engineer, F. Bergin, B.E., for the R.D.C. Plans, etc., can be seen at the office of D. J. Pursell, Clerk of Council, Council Offices, Naas, on any day (except Wednesdays and Saturdays), or at the office of the Council's Engineer, 36, Westmorland Street, Dublin. Tenders must be accompanied by a schedule of prices, and contain the names and addresses of two solvent sureties, willing to join in a bond of £500 for the performance of the contract within the specified period. The contractor will be expected to give preference to local labour.

May 6. **MANCHESTER.**—Laying and jointing of the southern section of the third line of pipes from Thirlmere to Manchester for the Waterworks Committee. The works will extend from about three-quarters of a mile north-west of Lostock Junction Station of the Lancashire and Yorkshire Railway to the Audenshaw Reservoirs of the Manchester Corporation, and consist of nearly twenty-three miles of cast-iron and steel pipes, 44in. and 40in. diameter, the construction of a tunnel 550 yards long, nine subways under railways and canals, nine bridges under and over railways, valve houses, discharge wells, and outlet works, the fixing of valves and ironwork, and other work connected with the third line of pipes. Plans and drawings may be seen, and printed specification, schedule of quantities, and form of tender obtained at the offices of G. H. Hill and Sons, civil engineers, Albert Chambers, Albert Square, Manchester, and 3, Victoria Street, Westminster, on deposit of cheque for £5 5s.. A limited number of copies of the drawings (uncoloured), excluding ordnance maps, are available, and will be lent to persons tendering in priority of application on receipt of the sum of £5 5s., which will not be returned. Tenders, addressed to the Chairman of the Waterworks Committee, must be forwarded to the Secretary, Waterworks Offices, Town Hall, Manchester.

May 7. **WRINGTON AND PERRY (Somerset).**—(See "Buildings.")

May 7. **BELFORD (Northumberland).**—Mains, etc.—Supplying and laying of mains, etc., in connection with Beadnell and Swinhoe water supply, for the Belford R.D.C. Specifications and forms of tender can be had on application to C. A. Lake, district surveyor, Warenford, Chathill. Tenders to be sent to Adam Douglas, Clerk, Alnwick.

May 7. **SALE.**—Designs, estimates, etc., for a portion of the widening of sale bridge, Sale, in the County of Chester, in reinforced concrete, for the U.D.C. Full particulars, together with plans, may be obtained on application to the Engineer, Henry Mattinson, A.M.Inst.C.E., 55, Piccadilly, Manchester, on deposit of £2 2s. Designs and estimates to be addressed to D. Hallewell, Clerk, Council Offices, Sale.

May 9.—**WOLVERHAMPTON.**—Supplying and fixing heating apparatus at Red Cross Street Girls' School (accommodation 359) for the Education Committee. Firms desirous of tendering must send in their names to "The Secretary, Education Committee, Town Hall, Wolverhampton."

May 9. **CHELMSFORD.**—Subsidiary works in connection with the Trinity Road Council school, which is now in course of erection:—Supplying and fixing floors of steel and coke breeze concrete, in conformity with the architect's specification, for the Borough Education Committee. Plans of the school building may be inspected at the office of the architect, W. H. Pertwee, the Institute, London Road, Chelmsford, from whom all particulars may be obtained. The contract for the erection of the school building has been let to Henry Potter and Son, of Chelmsford, and the person whose tender is accepted for the before-mentioned works will be, and act as sub-contractor to, and will be paid by, that firm. Tenders must be addressed to W. Smith, Town Clerk, Municipal Offices, 16, London Road, Chelmsford.

May 9. **MARGAM (Port Talbot).**—Completion of the following works for the U.D.C.:—(1) Main intercepting sewer; (2) flushing pond and penstock chamber. (The main intercepting sewer above high-water mark, and the flushing pond, are nearly completed). (3) Main outfall, 42in. cast-iron pipes, to 550 yards beyond low-water mark. (Of the main outfall to low-water mark 1095 yards have been laid out of a total of 2,034 yards, and no part of the work beyond low-water mark has been done). (4) Subsidiary works. The drawings may be seen and copies of the specification, form of tender, and schedule of quantities may be obtained on application to William Fox and La Trobe Bateman, 5, Victoria Street, Westminster, S.W., on deposit of £10. The drawings may also be seen at the office of the Council's Surveyor, Taibach, Port Talbot. Tenders must be addressed to D. E. Jones, Solicitor, Clerk to the Margam U.D.C., Port Talbot.

May 10. **MINSTER.**—Provision and laying of about 4,540yds. of stoneware pipe sewers, etc., for the Sheppey R.D.C. Plans may be seen, and specifications, etc., obtained, at the office of the engineer, F. W. S. Stanton, A.M.Inst.C.E., 3, Victoria Street, Westminster, S.W., on deposit of £4 4s (cheques only).

May 10. **SHEERNESS.**—Provision and laying of about 4,540yds. of 12in., 9in., 8in., and 7in. stoneware pipe sewers, together with manholes and flushing tanks, and about 1,560 yds. of 12in., 9in., 7in., and 6in. cast-iron pipes, comprising a sea outfall syphon, and two rising mains; also for the construction of two pumping stations, storage, liquefying and storm tanks, percolation beds, humus tanks, and sundry other works in connection therewith, for the Sheppey R.D.C. Plans may be seen, and specifications, bills of quantities, and forms of tender obtained at the London office of the engineer, F. W. S. Stanton, A.M.I.C.E., 3, Victoria Street, Westminster, S.W., till April 30, on deposit of £4 4s. (cheques only). Uncoloured prints of the drawings may be purchased from the printers on production of a signed permit, which prints must be delivered with the tender before the deposit fee of £4 4s. is refunded. Tenders to be forwarded to the office of John Copland, clerk, Sheerness.

May 11. **BELFAST.**—Supply and erection of apparatus for the aeration, purification, filtration, and heating of the water used in plunge baths at Templemore Avenue and Falls Road Baths, for the Baths and Lodging-House Committee. Plans of buildings, specifications, and other particulars may be obtained at the City Surveyor's office. Tenders to be delivered at the office of R. Meyer, town clerk.

May 11. **WOOD GREEN.**—Schemes and tenders for a reinforced concrete swimming tank, heating of the bath, private baths, etc., and steel roof trusses and sliding lantern over same, from firms who are respectively specialists in such work for the U.D.C. Forms of tender, preliminary specifications, and copies of plans may be obtained at the office of Wm. P. Harding, Clerk of the Council, Town Hall, Wood Green, on payment of a cash deposit of £3 for each set. The general conditions, and all further information may (on the production of receipt for deposit) be inspected and obtained from the architect, Harold Burgess, Capel House, 62, New Broad Street, E.C., between the hours of 3 and 5 p.m. Tenders must be delivered to the Clerk of the Council. The contractor will be required to pay the wages and observe the hours of labour in accordance with the scheme, a copy of which will be annexed to the contract.

May 13. **HANFORD.**—Hanford sewerage and sewage-disposal works—contract No. 1, for the Stone (Staffs.) R.D.C. Drawings, etc., may be seen, and bills of quantities obtained, at the office of the engineers, Willcox and Raikes, M.M.Inst.C.E., of 63, Temple Row, Birmingham, on a deposit of £3 3s.

May 13. **STONE (Staffs).**—Provision, laying and jointing of about 2,820 yards of stoneware pipe sewers, together with manholes and lampholes; the construction of about 920 yards of 5in. and 6in. cast-iron rising and hydraulic main; also the construction of pump-well, engine-house, liquefying tanks, bacteria beds, laying-out of irrigation area, and other incidental works in accordance with the drawing and specification prepared by the engineers, for the R.D.C. Drawings and specification may be seen and bills of quantities obtained at the office of the engineers, Willcox and Raikes, MM.I.C.E., 63, Temple Row, Birmingham, on deposit of £3 3s. Tenders to be delivered at the office of J. Buckley Norris, clerk, Union Offices, High Street, Stone, Staffs.

May 18. **BIGGLESWADE.**—Construction of about 7½ miles of stoneware pipe sewers, varying in size from 15in. to 6in., together with manholes, lampholes, ejector chambers, and other works; also for the laying of about 1½ miles of cast-iron and steel rising and compressed air mains, from 10in. to 2½in. diameter, for the U.D.C. Plans and specifications may be seen, and bills of quantities and schedule of prices obtained, at the offices of the Engineer, J. T. Eayrs, M.Inst.C.E., 30, Corporation Street, Birmingham, April 25 to April 30, and also at the office of the Surveyor to the Council, Market Place, Biggleswade, from May 2 to May 7, on deposit of £3 3s. Tenders to be delivered at the office of Henry Chaundler, Clerk to the Council, Council Offices, Biggleswade, Beds. It is hoped that only substantial contractors with extensive experience in similar works will apply.

No Date. **EGREMONT.**—(See "Buildings.")

IRON AND STEEL.

April 25—May 2. **BRISTOL.**—Steel.—Supply of wrought iron and mild steel, during year ending December 31, 1910, for the Sanitary and Improvement Committee. Specifications and forms of tender may be obtained at the offices of the City Engineer, 63, Queen Square, Bristol, on deposit of 10s. Sample bars as named in the specification must be delivered at the offices by 10 a.m. on April 25. Tenders must be delivered to the offices of the city engineer.

May 3. **SHIPLEY (Yorks).**—Supply and delivery at Shipley Midland Railway Station of steel girder tram rails and fishplates, for the U.D.C. Conditions of contract, specification and form of tender may be obtained at the office of W. H. Dawson, surveyor to the Council, Manor House, Shipley. Tenders to be sent to Isaac Lindow, clerk of the Council, Manor House. The contract will be let subject to the fair contract clauses of the Council.

May 11. **WOOD GREEN.**—(See "Engineering.")

PAINTING.

May 2. **BIRKENHEAD.** (See "Buildings.")

May 2. **STEPNEY, E.**—Re-decorating the exterior of their Mile End Public Library at Bancroft Road, E., for the Stepney B.C. Contractors will be required at all times during the existence of the contract to pay the trade union rates of wages as agreed to by the employers' association and the trades unions and as in practice obtain. Copies of the conditions, specification, schedule, and form of tender may be obtained by applying to the Borough Engineer, M. W. Jameson, A.M.I.C.E., at the Municipal Offices, 15, Great Alie Street, Whitechapel, E., between 10 a.m. and 12 noon, upon deposit of £1. Tenders must be sent to Geo. W. Clarke, Town Clerk, 15, Great Alie Street, Whitechapel, E.

May 4.—**FALMOUTH.**—Whitewashing and colouring at the workhouse, for the Guardians, in accordance with specifications, which can be inspected at the workhouse or at the offices of Reginald N. Rogers, clerk, Falmouth. Tenders to be addressed to the Clerk.

May 6. **MANCHESTER.**—Painting the iron bridges on the line of aqueduct, from near Ambleside to Agecroft, near Manchester, for the Waterworks Committee of the Corporation. Specification, form of tender, and all other information may be obtained on application to the Secretary, Waterworks Offices, Town Hall, Manchester.

May 7. **STANWIX (Carlisle).**—Outside painting, etc., of Stanwix Cemetery, for the Burial Board. Specifications may be seen, and the work pointed out, on application to the Curator. Tenders to be delivered to Wm. Dobinson, Clerk, 10, Bank Street, Carlisle.

May 11. **TOTTENHAM, N.**—Cleaning and painting and repairing work at the North-Eastern Fever Hospital, St. Ann's Road, Tottenham, N., for the Metropolitan Asylums Board, in accordance with conditions of contract and specification prepared by W. T. Hatch, M.Inst.C.E., M.I.Mech.E., engineer-in-chief. The conditions of contract, bills of quantities, specification, and form of tender may be inspected at the office of the Board, Embankment, E.C., and can be obtained upon deposit of £1. Tenders, addressed as noted on the form, must be delivered at the office of the Board.

June 12. **KIRKBY-IN-FURNESS.**—Re-painting the cottages at Herschell Terrace, for the Kirkby-in-Furness Co-operative Society. Specifications can be seen at the stores on application to the manager.

No Date. **BAILDON.**—Painting new golf pavilion, Baildon. Applications, in writing, must be sent to the Secretary.

No Date. **SEASCALE.**—Painting and colouring, at The Croft, Seascale. Particulars, apply, J. E. Werry, Duke Street, Barrow.

No Date. **WEST AUCKLAND.**—Painting and cleaning the Workmen's Club and Institute for the Committee. For particulars, apply T. Halfpenny, Secretary.

ROADS AND CARTAGE.

May 2. **MALDON.**—Supply of broken granite and flints for the T.C. Particulars and form of tender can be obtained at the office of Thos. R. Swales, Borough Surveyor, Municipal Offices, Maldon, to whom tenders must be sent.

May 2. **COVENTRY.**—Widening and sewering of Humber Road, situate in the parish of St. Michael's without the city boundary, for the R.D.C. Particulars may be obtained upon application to T. F. Tickner, F.R.I.B.A., surveyor, High Street Chambers, Coventry. Tenders are to be delivered at the office of James Arch, clerk, 13, Little Park Street, Coventry.

May 2. **RUNCORN.**—Making in tarmacadam of certain streets an passages in the parish of Stockton Heath. The QUALITY
of the
'KOH-I-NOOR.'

If there is one thing that the 'Koh-I-Noor' Pencil is inseparably associated with, it is QUALITY. At first men thought that 4d. was too much to pay for a black-lead pencil—until they tried the 'Koh-I-Noor' Quality. After that they needed no further persuasion to buy, in fact, it sometimes proved difficult to cope with their demands for the 'Koh-I-Noor.' Nothing but 'Koh-I-Noor' would suffice.

If you are one of those who still think that 4d. is a stiff price to pay for a pencil, an experiment will only cost you 4d. It won't be a costly experiment either, seeing that one 'Koh-I-Noor' outlasts SIX ordinary pencils. And then—the luxury of writing with such a magnificently-made pencil! You cannot know what it means until you try 'Koh-I-Noor' Quality. And you will never go back when you do know.

Made in 17 degrees from the hardness of a stylo to the softness of a crayon. One to suit every pencil purpose.

'Koh-I-Noor' Pencils are 4d. each or 3s. 6d. per dozen. Of Stationers, &c. Illustrated particulars free for the asking from L. & C. Hardtmuth, 12, Golden Lane, London, E.C. (Paris, Vienna, Dresden, Milan, Brussels, New York).

Fulwell Hydrated Lime.

A high-class Lime, slaked by a patent process, and packed in bags. Saves the labour of washing and running the lime, will not blow, leaves no waste, may be stored without deterioration and without bursting the bags.

For mouldings and lathwork can be gauged with a much smaller proportion of plaster than ordinary lime.

Converts lime into a safe, reliable and convenient material with the advantages of a bagged plaster.

Further Particulars and Samples from:—

The Exors. of the Late
Sir HEDWORTH WILIAMSON, Bart.,
Fulwell Lime Works, SUNDERLAND.

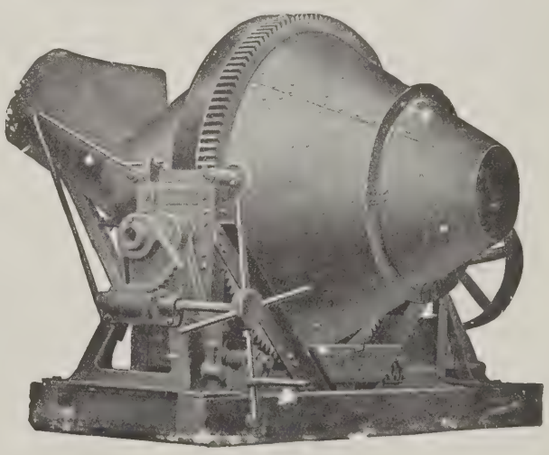

Fig. 982.

Smith Patent Mixer.

The best Mixer for **CONCRETE** or any Material.

STOTHERT & PITT, Ltd., BATH.

May 3. **HETTON-LE-HOLE (Durham).**—Supplying the following road materials, for the U.B.C. —1,000 tons of 2½in. ironstone slag, 700 tons 2½in. machine broken whinstone, 150 tons of ½in. machine broken whinstone, 200 tons of ½in. machine broken slag, and 50 tons of 1in. machine broken slag. Further particulars, together with forms of tender, may be obtained from the surveyor, John Harding, Township Offices, Hetton-le-Hole, to whom samples of the materials proposed to be supplied must be sent. Tenders must be addressed to Gordon Young, clerk, William Street, Houghton-le-Spring.

May 4. **ROMNEY MARSH.**—Supply and delivery of 220 yards of quartzite, to the following parishes and roads:—100 yards 2nd inch, Straight Road, Brookland; 200 yards 1in., Straight Road, Brookland; 20 yards 1in., Guldeford Road, Brookland; 20 yards 1in., Alliance Road, Brookland; 20 yards 1 in., Ivychurch Road, Brenzett; 20 yards 1in., Brenzett Road, Snave; for the R.D.C. To be delivered before September 1, 1910, and yarded at the expense of the constructor, in such manner and in such quantities as the Surveyor may direct, and subject to his measurement. Tenders to be delivered to William B. Smith, District Surveyor, New Romney.

May 4. **HAWARDEN.**—Supply of road stones for the maintenance of roads within the district, for the year ending March 31, 1911, for the R.D.C. The stones to be broken so as to pass through 1½ and 2in. gauges, of equal quality, free from dirt, and delivered, as required, at the following stations: Hope Village, Buckley Junction, Buckley (old station), Hawarden, Knowle Lane, and Watkinson's Sidings (Wrexham, Mold, and Connah's Quay Railway), Kinnerton, Broughton Hall, Sandycroft, Queen's Ferry (L. and N. W. Railway), and Rossett (G. W. Railway). Tenders are also invited for the carting of stones from the various stations, quarries andj gravel pits. Forms of tender and all particulars may be had on application to the District Surveyor, Wm. Newton, Drury, Buckley, Chester. Tenders to be delivered to Hugh G. Roberts, Clerk of the Council, Council Offices, Broughton, near Chester.

May 5. **STOCKPORT.**—Excavating, sewering, forming, paving, kerbing and flagging the following streets within the borough:—Bolton Street, Dover Street, Hurst Street, Rupert Street (part of), Stanhope Street, Springfield Avenue, Westminster Avenue passages Nos. 1 to 5 and 14 to 18 inclusive, and No. 1 off Rupert Street, for the Highways and Sewers Committee. Plans, sections, specifications and conditions may be seen, and forms of tender obtained on application to John Atkinson, A.M.I.C.E., borough surveyor, Town Hall, Stockport. Tenders, addressed the Borough Surveyor, Stockport, to be left at his office. Rate of wages and hours of labour clause to be observed.

May 7. **HARROW-ON-THE-HILL.**—Street improvement in Station Road, for the U.D.C. The work consists of widening the present carriageway and footway and other works incidental thereto. Plans may be seen and specifications and quantities obtained from J. Percy Bennetts, engineer and surveyor. Tenders to be sent to John Strachan, clerk.

May 9. **TENDRING (Essex).**—Supply of about 2,500 tons of granite, broken to go through a 1½in. ring, and delivered as required on to the wharves or into trucks, free of all dues, at the following places, viz.:—Harwich, Wivenhoe, and Mistley; also for the supply of the following quantities of red Kent flints, broken to a 2in. gauge, and delivered alongside the wharf, hard or beach, at the following places, as and when required by the surveyor, for the R.D.C.:—Beaumont 500 cubic yards, Harwich 400, Clacton 200, Kirby 200, St. Osyth 200, Great Oakley 200, Mistley 300, Landermere 300, The Flag, St. Osyth 200. A quantity of above will be loaded on rail to different stations, and will be paid for according to railway weight, i.e., 1 yard—21 cwt. Tenders must be sent to A. J. H. Ward, clerk, 42, Church Street, Harwich and samples should be sent addressed to the Clerk, Workhouse, Tendring Weeley. R.S.O.

May 10. **SALCOMBE.**—Supply of 1½in. broken forder stone, 2in. broken limestone, forder shippings, and limestone chippings, for the U.D.C. Particulars may be obtained on application to Frank Swinburne, surveyor, Fore Street, Salcombe. Tenders to be forwarded to C. E. Turner, clerk, Salcombe.

May 12. **CARLOWAY (Stornaway).**—Completion of the new road between Stornoway and Carloway with the branch to Breaselete, measuring 13 miles or thereby, parts of which are firmed and stone-bottomed. Specifications and plans can be seen in the office of Hugh Miller, Lewis District Committee Chambers, Stornoway, to whom tenders must be sent.

May 12. **OGMORE AND GARW.**—Supply of broken limestone and limestone chippings, equal in quality to the "Ewenny Blue Mountain Limestone" and also broken granite and chippings for road metalling within the Urban District of the Ogmore and Garw, for the period of twelve months, commencing May 16, 1910, and to be delivered in such quantities and at such times as the surveyor may direct from time to time at the following stations: Brynmenyn, Pontyrhyl, Pontycymmer, Blaengarw, Blackmill, Gilfach, Goch, Ogmore Vale, and Nantymoel. All limestone and granite shall be broken cubically and sufficiently small to pass through a 2½in. gauge by its largest dimensions. All chippings shall be broken to pass through a ¾in. screen, and must be free from dust when loaded into the trucks at the quarries. The approximate quantities of limestone and granite will be about 10,000 tons. The council will undertake to pay the railway freight. Specifications and forms of tenders and all other particulars may be obtained from the Surveyor, Council Offices, Brynmenyn. Tenders to be sent to the Clerk of the Council, S. H. Stockwood, solicitor, Bridgend.

May 30. **CAMBERWELL.**—Kerbing and York paving the footways in Peckham Rye West Side (from Barry Road to Nigel Road); also for roadway paving (patent or otherwise) to specification as submitted by contractors, for the B.C. Full particulars and form of tender can be obtained from Wm. Oxtoby, Borough Engineer, Town Hall, Camberwell, S.E. Contractors are invited to state the roadway paving they are prepared to lay and their conditions as to maintenance for a term of years. Tenders to be delivered to the Town Hall, Camberwell, S.E., addressed to the Works Committee.

MISCELLANEOUS.

May 2. **BRADFORD.**—Supply of timber for use in woodwork centres, and must be of the best qualities in the respective sizes required, for the Education Committee. Form of tender may be obtained on application to Tho. Garbutt, secretary, Education Office, Town Hall, Bradford. Tenders should be forwarded to the Secretary's Office, accompanied by samples of the woods quoted for. The successful contractor will be required to sign the Corporation fair wages resolution.

May 3. **LONDON.**—Providing and laying wood block flooring at school buildings, etc., for the L.C.C. Persons desiring to submit tenders may obtain the specification, form of tender, etc., at the Architect's Department, 8 and 10, Charing Cross Road, W.C. The contractors will be bound to pay to all workmen employed by them in and about the execution of the contracts or any part thereof, wages at rates not less, and to observe hours of labour not greater, than the rates and hours set out in the Council' list, and such rates of wages and hours of labour will be inserted in and form part of the contracts by way of schedule.

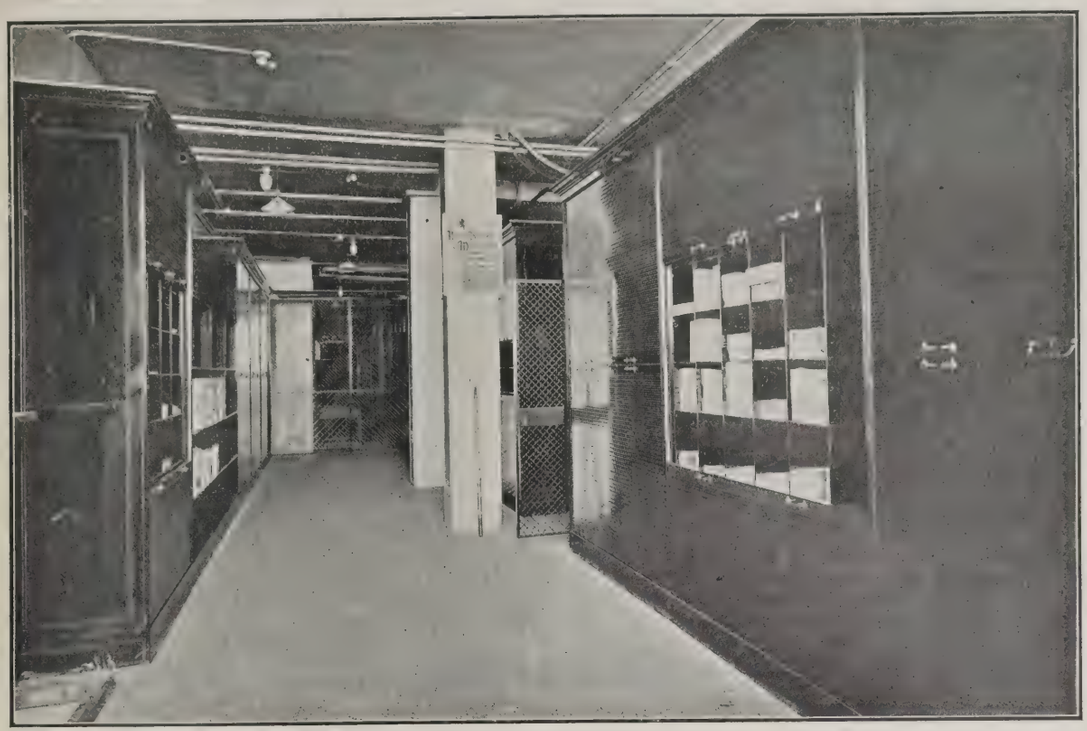
for
ARCHITECTS, ENGINEERS & CONTRACTORS

Containing about 200 pages of text and 200 illustration together with a detached Ready Reckoner (of celluloid) for the Designing and Checking of Slabs and Beams
Crown8vo, cloth, Price 7/6 net (postage 4d.)

REINFORCED CONCRETE

THEORY AND PRACTICE.

By FREDERICK RINGS, M.S.A.
Architect and Consulting Engineer.



The Author has had wide experience in designing and supervising Reinforced Concrete work, and his book, which embodies the most approved modern practice,

CONTAINS ALL THE FORMULÆ AND DATA NECESSARY IN DESIGNING AND CHECKING REINFORCED CONCRETE STRUCTURES.

The recommendations of the R.I.B.A. are adopted in the work; and the symbols used are those recently arranged by the Concrete Institute.

The Celluloid Calculator forms a valuable complement to the book, enabling the amount of metal, together with the thickness of slab required for all usual spans, to be mechanically obtained without any calculation whatever.

Architecture at the Royal Academy.

THE Architectural Room is embellished by two models, a class of exhibit we are always glad to see there, and wish there were more of them. The one of "A Church at Rio Janeiro," by Mr. Edward Larkins, is a beautifully executed model of a church in Byzantine style, brick and stone, on a cross plan (a small plan is affixed to the stand), with a central dome, rising pretty high above the crossing, and two subsidiary domes to east and west of it, which, from an ordinary standpoint, would hardly be visible as external features. The angle turrets, with small cupolas, are gracefully treated, and perhaps in their design owe something to the suggestions of Westminster Cathedral. Altogether this is a very meritorious specimen of revived Byzantine. The other model, a national opera-house for a foreign Government, by Mr. E. O. Sachs, assisted by Mr. A. H. Lister, is large and elaborate, but of rather commonplace architectural character, and no plan is appended.

After the models, it seems suitable to notice first the works of members of the Academy, and we may give the first place to Professor Blomfield, whose pencil drawing, "New Water Tower, Lincoln" (1634), is the best and most original thing in the room. The plan is compounded of a square and a circle, the latter inscribed in the square, and not showing externally. The object evidently is to obtain strength without an exaggerated thickness of walls. The simple and massive treatment of the tower, with some suitable architectural emphasis in plan and in the upper portion, makes it a grand and impressive object; a small sketch shows how it combines in the landscape with the cathedral. Professor Blomfield also exhibits "New Buildings, Sherborne School" (1641), on an irregularly shaped site; the side shown in the perspective view has a pavilion somewhat Georgian in character at each end; in the recessed portion between, windows of Classic character are divided by Gothic buttresses, but the whole hangs together very well, and has the true school character. His other exhibit, a mansion in Jersey (1629), is not so interesting architecturally, but has an effective and convenient plan; it would have been better if a north point had been added; but Professor Blomfield at least gives plans, which many exhibitors do not, and hence treat us only to pictures of buildings without any indication of the basis on which they are founded. This is an old complaint in regard to Academy exhibits, and it will probably continue until the Academy Council wake up to the fact that plans are an important element in architectural design, a fact which seems to be completely ignored now; indeed, we have actually heard the omission of a plan defended by the author of a drawing on the ground that it was less likely to be hung if disfigured by a plan! In one case three or four years ago we know that an architect sent a plan, absolutely necessary to explain his perspective drawing, in a separate frame, and it was declined and the perspective hung without it. All of which shows how far the Academy at present is from realising how architecture ought to be illustrated.

We may take the remainder of the Academicians' designs in alphabetical order. Mr. Belcher sends a large elevation of his "Ashton Memorial, Lancaster" (1556: no plan), which has been illustrated before in this room; the present drawing is his diploma work, and a very worthy one. It is a rare chance for an architect in these days to have the opportunity of carrying out on a large scale a work purely for architectural effect, and he has made the most of it. His "Holy Trinity Church, Kingsway" (1545: no plan) is a free Classic design, with a graceful tower in several stages, somewhat spoiled by the same kind of panel and sausage ornament which adorns (?) his building at the top of St. James's Street; a mere fashion in architectural detail, which will be laughed at when it has ceased to be the fashion. The lower part of the front takes the form of a concave half-circle towards the street, reminding one of M. Guibert's memorial church in Rue Jean Goujon at Paris (which perhaps suggested it). The "New Building for the Zoological Society, Regent's Park (1567: no plan), which we presume is a house for the scientific staff, or something of that kind, is a very pleasing and sensible-looking building of a quiet type, with none of the eccentricities of detail which spoil the church.

Messrs. Ernest George and Yeates scarcely ever show a plan to the charming water-colour drawings they exhibit. "Crathorne Hall, Yorkshire" (1425), is a water-colour drawing of a large square stone house, with a projecting bay on the entrance front, carrying four columns and a pediment in the upper portion; a balustraded wall and gate-piers, carrying heraldic figures, form a foreground incident. The "Royal Academy of Music, Marylebone Road" (1495), is a building in somewhat the same style, with a large hip-roofed centre block, and two smaller wings, which do not seem sufficiently connected, architecturally, with the centre block. The plan and arrangement of a building for an Academy of Music would have been a matter of some interest; but here we are merely shown the outside picture of the building, and whether it is suitable for its purpose or not there is nothing to show.

"New Museum of Archæology and Ethnology, Cambridge" (1447: no plan), by Mr. T. G. Jackson, is a fine pen drawing showing an effective treatment of the end of the main block nearest the spectator, divided up by buttresses which in the upper stage develop gracefully into small columns; and there is a good deal of picturesque effect in the treatment of the flank of the building. But the planning of a museum is a very important matter, in the way of facilities of lighting and arrangement, and on this we get no information. It is to be hoped, at all events, that the museum floor space is not cut into by iron columns, as at the Sedgwick Museum at Cambridge by the same architect, in a case where girders could perfectly well have been made to carry a floor without any interruption from columns. The same architect exhibits a drawing of part of Winchester Cathedral (1496), "A suggestion for restoring the cloister in connection with the necessary buttressing of the south side of the nave"; this is, of course, purely Gothic revived work. The cloister is shown with richly

traceried windows (or openings), looking of a date a trifle later than the adjoining work; but that is no objection, even on archæological principles; the cloister might have been built later. It will be the best method to mask the buttressing and give coherence to the whole; and however we dislike restoration on principle, this is a case in which whatever is erected must be in keeping with the remainder of the building.

Sir Aston Webb exhibits a large drawing of "The Entrance to the Mall from Charing Cross" (1472), with a small plan attached. The real importance and effect of this erection will, of course, not be properly realised till Drummond's Bank and some other buildings are got out of the way; at present the building seems crowded, and there is not space to see it properly. The water-colour drawing is rather heavy and loaded in effect, and does not show the building under the most favourable effect of light. The "Students' Union" (1465), in connection with the College of Science at South Kensington, is a very pleasing quadrangle design, in what might be called a classic version of Collegiate Gothic; it has the traditional English college character about it, with some modification in detail. A small illustration of this is given on another page—much smaller than was intended, owing to a misunderstanding through the telephone with the photographer; and there was no opportunity of taking another photograph. We like also very much the still simpler building, "New Buildings, Magdalene College, Cambridge" (1470), with their quiet homelike character; plain as it is, it makes a very pleasing group.

Among the designs for public buildings, other than those by Academicians, the most important is the large perspective view of Mr. Ralph Knott's "New London County Hall" (1420: no plan). This shows the building as seen from the river. Though this design is not all that might have been hoped for from such a great and exceptional architectural opportunity, it has the great merit of being broad, simple, and massive in design, and free from any eccentricities of detail. The mistake, to our thinking, lies in the abnormally high roof, which is out of keeping with the classic and level lines of the general design, and appears more especially so at the centre, where the line of the building takes a concave sweep inwards in the rear of the columned screen in front. This kind of treatment is essentially Classic, and the curve of the great mass of high roof takes away from the dignity of the design at this point, and looks comparatively crude and shapeless. The fact is that, whatever may be said about the architectural truth of showing the roof of a building, the style adopted for this building is one which by habit and association goes much better with a balustraded finish and a concealed, or, at any rate, a subordinated roof, than with this lofty mass of roof, which is much more in keeping with a building of more mediæval type of architecture. The incongruity would be less felt if all the masses of the building were in straight lines; but the shapeless-looking curved mass of roof in the centre is bad and unarchitectural in effect, and we hope it will be altered. The most important exhibit of public architecture next to this is perhaps Professor Pite's large and powerful pen-drawing, "Design for Approach from St. Paul's Bridge" up to the Cathedral (1610). The author gives the plan of his street; the perspective is a bird's-eye view up the street, above the tops of the houses, the south side of St. Paul's filling up the background. The drawing is one of those fine pieces of effect which Professor Pite has always known so well how to produce with the pen, but in consideration of the subject of the drawing it does not really show sufficiently what his proposed design of the street is; we look down from above on a number of pediments and porticoes on either side of a street which, from this point of view, looks too narrow for its position and importance, and the drawing somehow does not produce the effect of the street being axial with St. Paul's south portico, which (as the plan shows) is of course the intention. In short, this drawing must be called an effect rather than a design; as an effect it is very interesting.

Mr. A. Koch exhibits a view of his design for the "Peace Palace at the Hague" (1419: no plan); by no means the worst of the designs exhibited in that remarkable competition. It shows a kind of columned temple running across the site at a high elevation, with three lower blocks or wings projecting from it at right angles, on a lower level. A plan would have explained the use and *motif* of these, which require this explanation; otherwise it is a fine pile of building, rather spoiled by the heavy square erection which forms the crowning feature.

Mr. Paul Waterhouse's "Refuge Assurance Co., Manchester" (1421: (no plan), is a charmingly executed wash drawing of a courtyard of a building in Classic style; its interest is perhaps pictorial rather than architectural. There is not even pictorial interest in the "Design for Training College for Teachers, Leeds" (1424: no plan). What is the object or the point, in a room which is supposed to exhibit contributions to the are of architecture, of a large bird's-eye view of a group of utilitarian buildings, so small that no detail can be shown? All that such a drawing shows is that the author has carried out, or is going to carry out, a large group of buildings for a training college; no architecture is shown, and no plan to give a clue to its arrangement. We have no doubt it is a good building for its purpose; but bird's-eye views of this type are little above the level of advertisements; they have no architectural interest.

Mr. A. Harrison's "Public Baths, Nechells, Birmingham" (1434: no plan), is a picturesque building, but the towers, of pleasing design, are out of place in a building of this kind; they are useless, and have no relation to the purpose of the building. Mr. Stokes's "Proposed New Quadrangle, Emmanuel College, Cambridge" (1457: no plan), is a water-colour view, showing a quadrangle of brick and stone buildings of a suitable collegiate type; the drawing is rather roughly executed, and gives no clue to the real nature of the details, only to the general effect. Messrs. Russell and Cooper's "Design for Berkshire County Offices" (1487) has the merit of being properly illustrated in an architectural sense, by plans, elevation, and detail elevation; it is to be regretted there are not more drawings in which this method of illustrating a design is adopted. The building is a simple one of classic character, brick with stone dressings; it perhaps might have been made a little more municipal in expression; it has rather too much the effect of being a large private house, as far as the elevations are concerned.

After this we come to a large collection of church architecture designs, which are grouped in one part of the room, and which we will return to on another occasion. Passing them for the present, we come on a large drawing of Mr. Murray's, "Woods and Forests Offices," in Whitehall (1552: no plan), which we illustrated some little time back. This is a dignified building, but the main height (excluding the attic) is divided too nearly into two equal heights, which never has the best effect; and the result is that the cornice, well proportioned to the general height of the structure, looks too heavy for the upper storey with which it is more directly connected. A lower basement storey, and a proportionally higher upper storey (using the word "storey" in relation to the architectural divisions only) would have had a better effect. As drawn here, the angle volutes of the Ionic capitals seem to spread too much for good effect; this is perhaps the fault of the drawing.

Mr. Kitsell's two small drawings of "Oak Bridge and approach, St. Petroe Minor, Cornwall" (1565), are rather interesting as a treatment of an unusual subject; it is a pity that he spoiled the simple and suitable treatment of the oak bridge by the piece of wrought iron filigree over the centre, apparently to carry a lamp; it should have been more simple in line; it is quite out of keeping with the oak-work. The approach, with its cylindrical angle piers topped with stone balls, flanking the steps, is a good bit of masonry design. The last drawing we can mention at present is Mr. Warren's "Dining Hall, Caius College, Cambridge" (1609); a per-

spective view of a dining hall, wainscoted with wood panelling and pilasters in the Jacobean manner, and roofed with an open timber hammerbeam roof—a Gothic form with Classic detail; the whole looks very well.

As already intimated, we shall have more to say about other exhibits.

The R.I.B.A. Annual Report.

The Report of the Council of the Institute of Architects for the official year 1909-1910 records that some of the most important work of the year has been done by the Housing and Town Planning Committee. Under the guidance of the Committee a number of Town Planning Committees have been formed by the allied societies, and are engaged in co-operation in the study of the problems of town planning, and in bringing architectural influence upon municipal authorities who may be carrying out town-planning schemes. By this extended and combined action of the profession it is to be hoped that a good deal will be accomplished in the right direction. The most important event of the year, in the opinion of the Council, has been the approval of the new by-laws by the Privy Council. It is important, no doubt, in the sense that it gives the Institute a platform from which to initiate a movement in favour of getting the profession more generally represented in the ranks of the Institute, which will increase its power of action for defence of the profession when necessary. But this after all is only architectural politics; and we should say that the promotion of the general study of town planning was really the more important success of the two. It is satisfactory to learn that the arrangement for taking over additional premises in connection with the present Institute rooms is concluded, and the Conduit Street Galleries, with their entrance from Maddox Street, will be taken possession of by the Institute on June 24th. More space has been much wanted; but much will have to be done in the way of internal rearrangement and decoration. We hope the importance will be recognised of keeping the library together on its present floor, and not dividing it up among different floors, which would much impair its usefulness. The Report of the Art Standing Committee touches on some important points. They have the concurrence of the First Commissioner of Works in claiming that the design of the Piccadilly Hotel (Mr. Norman Shaw's design) should be carried on to the corner of Air Street; it appears that there has been an effort to secure the carrying out of a reproduction of an existing façade at that point. It is astonishing what trouble people will take to spoil a great building scheme. Referring to the matter of St. Paul's Bridge, the Art Committee's Report suggests that further action by the Institute may be desirable with a view to safeguarding the architectural character of the work. As the Report says, after referring to the deputation of the Institute, "the subsequent action of the Corporation is somewhat obscure." It certainly is, and our conviction is that mischief is brewing to the bridge, and that the Corporation, unless strong pressure is brought to bear on them, will pay no attention to the representations that have been made to them.

Some Opinions and a Moral.

Mr. J. W. Simpson's paper, under the title, "With Share and Mattock," read before the Northern Architectural Association in December last, has been circulated as a separate pamphlet, and contains some opinions worth consideration and comment. Touching the question of competitions, Mr. Simpson is less pessimistic than a good many recent critics; he does not sympathise with the cry about wasted labour, and contends that the labour is not wasted if it induces architects, young ones especially, to study an architectural problem and learn how to handle it. That it is a good argument in regard to young architects, of whom it may often be said that if they were not working on a competition they would not be doing anything equally profitable to themselves with the time; but it does not apply in the case of older men. There is too much competition for works of average size and importance, and it is rather heartbreaking to architects who have passed out of the rank of beginners to find that they have no chance of getting a commission of any importance without competing for it. And with the best of assessors, competition, though (as Mr. Simpson says) it ought not in that case to be called a "lottery," is liable to be influenced by the "personal equation" of the assessor, who, after all, is mortal, and therefore fallible. The progress of the examination system, and the remarkable results it has achieved, is another point touched on by Mr. Simpson, who refers to its small beginnings less than twenty years ago, when, as he says, the examiners were as nervous as the examinees. The rapid development of schools of architecture, which has been one result, renders it highly desirable that steps should be taken by the new Board of Education, as soon as it is in working order, to bring about a general agreement throughout the country as to the lines of architectural education. This leads up to the subject of the formation of a British school of architecture at Rome, and the example of the French school at the Villa Medici. There are complaints in France that the influence of the school is to produce academical architecture. So it does to a certain extent, but academical training is not a bad basis to start from; whereas originality will overleap the academic lines in time, and there is no doubt that the training of the French architects at the Ecole, and the Villa Medici, is far beyond anything yet attained or possible in England. Their wonderful sets of drawings and studies of ancient work are a practical proof of this, visible and comprehensible to all; and in their competition designs for problems in modern architecture, plan is studied with a thoroughness which we never see here. The competition designs, both for the Institute and for the Royal Academy prizes, are very feeble affairs compared with a Villa Medici student's *envoi*. We ought to make it an aim to rival the French in this respect. The "moral" of Mr. Simpson's remarks, at the end of the paper, is short and much to the point, that the question for architects to ask is not "What has the Institute done for me?" but "What have I done for the Institute?" It would be better, both for architecture and for the profession, if more architects would adopt that way of looking at things.

Quaint Contract Conditions.

The contractual referee, it seems, has his several degrees of autocracy. The superlative degree seems to have been reached at Shrewsbury, where, with reference to proposed stables, etc., for the Town Council, a so-called "arbitration clause" has been drawn up in the following curious terms:—"In order that there shall be no dispute or difference, and that none can arise between the architect and the contractor at any time during the progress of the works, or after the completion of the same, the architect shall be sole judge of, and shall determine all matters and questions arising on the construction of the contract, or in reference to, or arising out of, or in any way connected with the contract, and as to the determination, abandonment, breach or forfeiture of the contract by either of the parties; and as to the rights of the parties under the contract; and the architect's decision or valuation thereunder made in writing shall be conclusive, final, and binding upon both parties. The architect shall not, in making any such decision or valuation, be required in any case to hear either or both of the parties upon nor to inquire into any of the aforesaid matters or questions; nor shall the architect act judicially or in any way as an arbitrator between the parties, but he shall act in every case solely upon his own judgment." This is surely the kind of thing about which one feels that there is no need to say anything but "There it is, gentlemen: look at it!" As a "short method" of smothering "dispute or difference" it could hardly be improved. Nothing could well be more grandly simple. But alas! there are signs that we are

emerging from the primitive trustfulness of the patriarchal age, and the idea of benevolent despotism is rapidly losing its old-time fascination. "Here am I; do unto me as thou wilt." is, for instance, no longer regarded as the orthodox attitude of devotion among such builders as have sealed themselves of the tribe of the Federationists. These people have imbibed the more modern views on equity, and have acquired a very pretty knack of asserting and maintaining them. In particular, they are in revolt against the contractual referee. This may be news to the Corporation of Shrewsbury; and the wisdom of the Corporation of Leicester is also, for the moment, seen but dimly through the dust of its archives, whence, presumably, it has dragged forth this quaint specimen: "The contractor shall take all risks and liabilities of whatever kind, arising out of or incidental to the construction, completion, and maintenance of the works, and shall be responsible for, and shall at his own expense make good, all accidents, loss, or damage which may happen to the works, material, or plant, from any cause whatever, including (without thereby limiting the foregoing general words) accidents from fire, flood, weather, tempest, failure of soil or foundations, act of God or the King's enemies, during the construction, completion, and maintenance of the same." When the Master Builders' Association objected to the conditions of which that is a sample, an alderman of the corporation said, in phraseology faintly suggestive of the more recent archives, that these builders were "holding a pistol at the heads of the committee." Again, we feel that any kind of comment would be entirely superfluous. Such conditions, when brought out into the light and air, have a habit of promptly crumbling into nothingness. Surely that should be the natural fate of the condition making the unfortunate builder responsible for every accident that could possibly be remembered or imagined, including "the act of God or the King's enemies"—a villainous inkhorn phrase that surely shall not survive our mocking laughter.

THE EIGHTEENTH CENTURY ARCHITECTURE OF BATH.

By MOWBRAY A. GREEN, F.R.I.B.A.

[*The most complete and convincing history of the Architecture of Bath is that written by Mr. Mowbray Green, published some years ago. His lecture to the Architectural Association, of which the following is an abstract, will be found full of interesting facts and information.*]

The end of the seventeenth and the early days of the eighteenth centuries, saw great changes both in the life and pursuits of the people of Bath. The value of the healing waters had again impressed itself upon the minds of physicians, and several of them had written treatises upon the waters, with the result that visitors, including Royalty, came to stay in the old city. But it was cramped, dirty, and ill-fitted to receive the gentle and noble ones who came so willingly to submit themselves to the drastic treatment which the doctors prescribed. The city was scarcely larger than it had been in mediæval days, and was full of interesting houses of the Elizabethan and Jacobean periods, many of which are portrayed on Gilmore's map of 1694. It was surrounded by walls and gates, and had an area of about 37 acres. Within fifty years of this period almost the whole of this charming early work had disappeared, and the later Renaissance had taken possession of the city. At the present time there remains merely a small piece of the city wall on the upper Borough Walls and the East gate, together with some four or five relics of the sixteenth and seventeenth centuries hidden away in different parts of the city.

Early Builders.

Of the builders of the early years of the eighteenth century little is known, with the exception of a mason called Greenway, who, with his sons, in later years carried on quite an extensive business in the making of ornamental stone vases

THE STUDENTS' UNION, PRINCE CONSORT ROAD, SOUTH KENSINGTON, IN CONNECTION WITH THE IMPERIAL COLLEGE OF SCIENCE AND TECHNOLOGY, SOUTH KENSINGTON. SIR ASTON WEBB, C.B., R.A., ARCHITECT.

and the like, and who in this capacity is favourably mentioned by John Wood.

One of the earliest buildings, which stood until a few years ago on the east side of Orange Grove, was Nassau House, with a façade in the Corinthian manner. The porch was preserved when the house was demolished, and may now be seen rebuilt into the wall that divides the Institution gardens from the basement of the Empire Hotel.

Of about the same date is Marshal Wade's house in the Abbey Yard, a composition of the Ionic order. The openings on the ground floor were originally arched, but the upper storey forms a poor feature, and may have been rebuilt at some time. There is nothing of interest inside the house.

In 1707 George Trim began to build just outside the north wall of the city, and there still remain in this street several interesting houses. In one of these General Wolfe was staying when he received orders in 1759 to proceed to Quebec. The chief characteristic of the houses of this period

Block Plan of the City of Bath.

is their individual treatment by a marked central feature which contrasts with the later Palladian manner when all the parts are made subservient to the general design, and where the grouping of the window openings frequently does not indicate the internal arrangements.

In 1716 Green Street was begun, and here is perhaps one of the best examples left in Bath of this period. The sashes are divided by heavy glazing bars; and though the rooms are not large, they are panelled throughout, and the ceiling is kept on a line with the underside of the window head, producing a far more cheerful and comfortable interior than was possible under the exigencies of Classic architecture.

Greenway and Killigrew.

About 1720 the south side of Westgate Street was taken down and rebuilt, and at this same period Thomas Greenway had in hand a group of houses called St. John's Court, on a piece of ground known as the Town Mixen or Rubbish Heap, and facing on the old Timber Green, known now as the Sawclose. The large house now absorbed into the theatre was at one time occupied by Beau Nash. It had projecting rusticated quoins, with a main cornice above the first floor and a high attic storey over. The lower portion of the entablature is broken above each window, but the mouldings are on the whole poor and ineffective. Adjoining it is the house where Nash died. This has a fine doorway of the Corinthian order nearly 14ft. high from the ground to the top of the cornice, and surmounted by two dies with crouching eagles above them, all the work of Greenway, and full of interest.

Another work which may probably be attributed to Greenway is Widcombe House, which was built in 1727 for Philip Bennet the younger, who afterwards represented Bath in Parliament; it is referred to as a "new mansion" in an indenture made between Bennet and Ralph Allen in 1730. The coupled Ionic pilasters have foliated caps and stand on a plinth, the capping of which also forms the top moulding of the balustrade in the garden. On the whole the elevation appears too large in the scale of its details and is set down too closely to the ground to be quite satisfactory. The interior of this house has a good staircase, and that is all.

In the kitchen-garden on the other side of the road is a little garden house with a frontage of 18ft. 6in., much altered, but in good preservation. The original house had three openings on the front with three corresponding alcove seats at the back, and with one opening at each end. These openings are flanked by three-quarter Doric columns, and on the first floor over the two outer ones is an Ionic column. The broken entablature is a feature scarcely known in Bath. The interior of the lower room is entirely of stone, even to the cornice, and the whole of the mouldings in this little building are executed with great refinement. It is probably an earlier building than Widcombe House. Near the stables is the old dovecote, rapidly going to decay.

Among the builders of this time should be mentioned William Killigrew, who built the chapel at St. John's Hospital and a group of houses at the back of St. James's Church, two of which still remain.

John Wood.

We are now at the period when John Wood began his work in Bath. He was born in 1704. But little is known of his early life and training; he was a Yorkshireman, but the influence which attracted him to Bath, unless it was the chance meeting of Ralph Allen in his own county, is not apparent. Certain it is that at the early age of twenty-one he had large ideas as to the rebuilding of Bath, but he was not successful in bringing it about in the way he then intended. One of his first definite works in the city was the building of the upper part of St. John's Hospital for the Duke of Chandos in 1727, a hospital founded for the reception of six poor men and six poor women. The two sides facing the courtyard are treated without ornament, and are finished with a crowning cornice of the usual modillion type. Quite close to this is another group of houses known as Chandos Buildings, erected by Wood in 1727 for the Duke of Chandos.

In the early part of this same year Wood was also engaged upon the rebuilding and enlargement of a house in Lilliput Alley, or North Parade Passage. The house was probably a seventeenth century one, and was owned by Ralph Allen, the pioneer of the cross post system of letter carrying. The well-proportioned front, with its rusticated basement, Corinthian order, and pedimented roof, was an addition to the old portion of the house, which latter he refronted. There are features and details here very unlike Wood's later work, but it may be that he had not entirely settled in Bath, for he had been living on and off in London for two or three years between the time of his leaving Yorkshire and his finally coming to Bath, and it was evidently the custom of the period to allow the builders a fairly free hand in the execution of their work.

In spite of many disappointments he at last succeeded in starting, in the year 1729, a square just outside the north-west boundary of the city, and this he called Queen Square in honour of Queen Caroline, wife of George II.

The scheme as originally planned shows Wood Street, named after himself, as 90ft. wide, but this was afterwards reduced by one-half, and the square, as completed, measured 316ft. from north to south, and 306ft. from east to west, reckoning from house to house. The gardens in the centre of the square, as well as the areas of the houses, were surrounded by a stone balustrading, with either openings or gates in the centre of each side of the gardens, but by 1790 the balustrading seems to have disappeared and iron railings have taken its place. Some of it may, however, still be seen on a wall in Lyncombe Vale, where it was put up at the beginning of the nineteenth century. Part of that round the houses existed, however, as late as 1819.

The principal side of the square is that on the north, where a rusticated ground-floor storey supports a Corinthian order, which runs through the first and second storeys, the centre and two ends being slightly projected and having three-quarter columns, while the intervening parts have pilasters. The sills of the first-floor windows have all been cut down and their proportion thereby marred. The level of the original sills is shown by the flat course on either side of the windows. The centre and end blocks had quite a superabundance of rich detail even up to the attic course, but this could only have been seen when it was newly carved. It certainly points to the fact that the builders had at their command a large amount of skilled artisan labour. The façade was very ably designed to accord with the internal planning, though there have been many alterations in later days, either by turning doors into windows or windows into doors. The plans of the centre house give us some idea of the manner of life at that time, for we see that it was customary not only to have bedrooms on the ground floor, but to plan the houses with rooms so entirely *en suite* as to make them quite unsuitable for the customs of a later generation. In this case the interesting doorways which have been cut through into the back bedrooms on the first floor will show that that storey was evidently designed largely with a view to providing reception rather than bedroom accommodation. The attendants' rooms at the further end of the garden were probably used as waiting-rooms by the chairmen, who brought their fares to call at the house, and the under-part of the room on the right side of the house seems to have been constructed to take the Sedan-chairs, while the staircase itself was specially contrived with a circular end so that patients who came from the baths might be carried straight up to their rooms before getting out of the chairs.

NOTES AND NEWS.

The Late Lewis F. Day.

Last week we referred briefly to the death of Mr. Lewis F. Day, and gave a short appreciation of his character and his work. He will be sorely missed, and the comparatively humble yet exceedingly useful sphere of art which he influenced and adorned will be distinctly the poorer for the cessation of his activities. His manuals, such as those from which the accompanying illustrations are taken, are unique of their kind. They are at once artistic, scientific, and practical, remarkably clear in exposition, and not less remarkably free from the fads, mannerisms, and preciosities by which the writers upon such subjects are usually betrayed into futility. Mr. Day, while undoubtedly endowed with a large measure of the artistic temperament, always remained sane, salutary, and eminently practical.

We give some illustrations from "The Anatomy of Pattern," showing Mr. Day's method of working out and illustrating his subject. Figs. 1 and 2 are diagrams showing the evolution of pattern, in the one case from hexagons, in the other case from circles. Fig. 3 is a charming piece of diaper ornament, which shows how the geometric skeleton on which the pattern is planned may be entirely obliterated from view after it has done its work in furnishing the groundwork of the pattern. In reference to this design, Mr. Day says:—

> You have not done away with construction when you have succeeded in keeping the scaffolding out of sight. Again, the use of the broken line instead of the straight, or of the curved (which we shall have to consider more particularly further on), makes no difference except in effect. The skeleton is the same, though you show no lines at all, as in the "all-over" pattern on Plate 5 [our Fig. 3], which is planned on the parallelogram given by lattice lines.

Fig. 4 is from "Alphabets, Old and New," and is one out of a series of very interesting designs for alphabets suited to the nature of different materials. Fig. 4 is one for execution in beaten metal. It will be seen how cleverly the design of the lettering is suited to the character of the material.

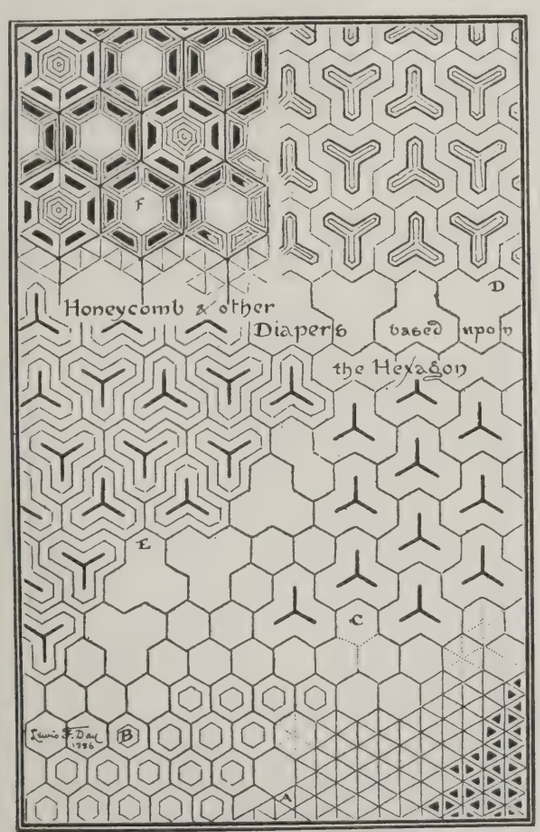

FIG. 1. THE EVOLUTION OF PATTERN FROM HEXAGONS.

(From "The Anatomy of Pattern," by Lewis F. Day. By permission of Mr. B. T. Batsford.)

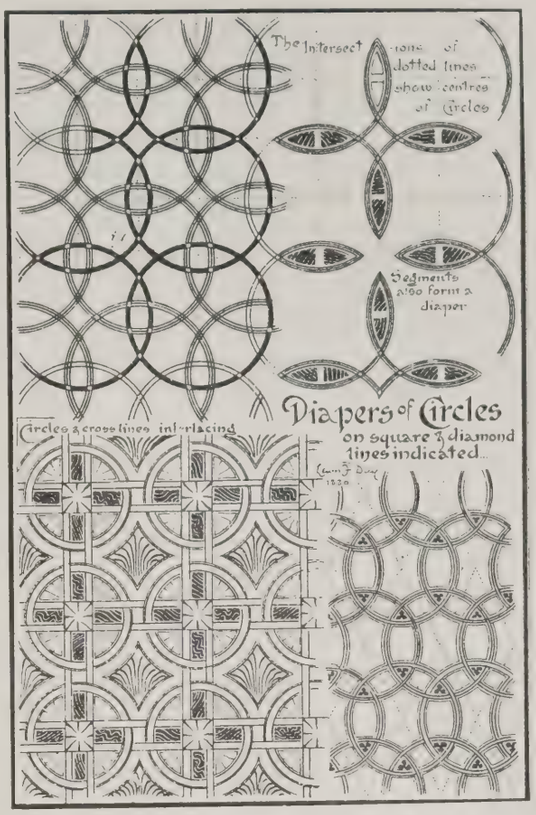

FIG. 2. THE EVOLUTION OF PATTERN FROM CIRCLES.

Tips for Town-Planners.

In discussing the question of finding a suitable site for Manchester's proposed art gallery and library, Mr. Frank L. Emanuel suggests the advisability of erecting the buildings in the form of a hollow square, planned in such a manner as to leave as large a central space as possible, where a beautiful formal garden should surround a central fountain. Such a garden, he urges, would provide a fine opportunity for the display of sculptural adornment, "gradually to be acquired by the city or on temporary exhibition." The gradual acquisition that has been seen elsewhere does not strongly support this plea. A fortuitous and heterogeneous collection of more or less ill-carved or ill-cast images in stone or in bronze, at war with each other and with the elements, does not excite the most pleasurable emotions. The statues in such a garden should form an obviously integral part of a well-ordered scheme, and should not be comparable to the incongruous elements of the crowds that, we trust, will find enjoyment in the projected pleasaunce, if ever it materialises. Another correspondent is for the inclusion of a theatre in the scheme—"a bijou playhouse, holding some 600 to 800," which "might well become the model for the future municipal theatre." We applaud the idea; it is a further concession to the growing demand for art in three dimensions. There are on all hands unmistakable indications—and this suggestion is one of them—that we are emerging from the old puritanical view of the drama, and that the new spirit will have to be taken into account by the town-planner. The chief glory of English literature is its dramatic section; and everywhere we see a desire to enact such plays as can no longer hold the stage

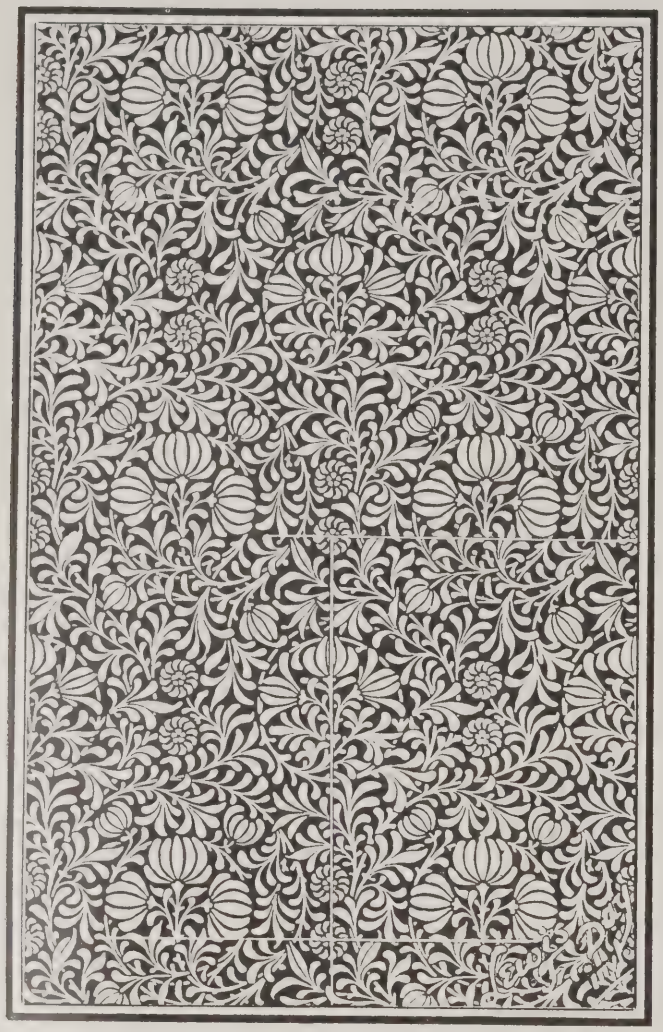

FIG. 3. A CHARMING PIECE OF DIAPER PATTERN BY LEWIS F. DAY.

(From "The Anatomy of Pattern." By permission of Mr. B. T. Batsford.

commercially. The municipal theatre is becoming distinctly necessary. So also is the place of public assembly in which political and social meetings could be held.

International Housing Congress.

The International Housing Congress opens at the Imperial Museum of Arts and Industries, Vienna, on Monday, May 30, and concludes on Thursday, June 2. Arrangements have been made by the National Housing and Town Planning Council for the delegates from this country to visit Paris, on their way to Vienna, where, on Thursday, May 26, the new Paris town planning scheme will be the subject of consideration. (The scheme was described in a delightful article by M. Benoit Lévy in the "Architectural Review" for February last.) On Saturday, May 28, a visit will be paid to Ulm, and the delegates will afterwards proceed to Vienna. At the conclusion of the Congress the party, which will include members of a large number of municipal councils, will travel to Dresden, and on Monday, June 6, study the town planning there. The two following days will be spent in Berlin, and through the kindness of Professor Dr. Eberstadt, Dr. Werner Hegemann, and their colleagues of the Town Planning Exhibition, an interesting programme of town planning study has been arranged. The exhibition is to include the best town plans in Europe.

More Spadework at Verulamium.

Arrangements are being made for an early commencement of the systematic excavation of the Roman city of Verulamium, which lies to the south-west of St. Albans, and comprises an area of about 200 acres. Except for the church of St. Michael and part of the village of St. Michael, it is but slightly built upon, so that the greater part of its area will be available for excavation. It is proposed that the explorations committee of the Society of Antiquaries, acting jointly with a local committee, with Lord Verulam as chairman and Canon Glossop and Mr. W. J. Hardy, F.S.A., as secretaries, shall undertake this work, of which Professor F. J. Haverfield, Camden Professor of Ancient History at Oxford, will have supervision. It is hoped that the excavation will lead to the discovery of one or more early Christian churches, and thus throw fresh light upon that obscure period, and that it will also yield additions to the history and archæology of the Romano-British period, and to those of the late Celtic age.

St. Paul's Bridge and Southwark Bridge.

Mr. James Wann, C.C., in the course of an address upon "Bridges under the control of the Corporation," gave the details of the scheme for the proposed St. Paul's Bridge, and the alteration of Southwark Bridge. With respect to Southwark Bridge, it was proposed, he stated, that the three spans and piers should be demolished, and a new bridge constructed with crown about 6ft. lower than was the case at present. The gradients would be improved from 1 in 18 to 1 in 32, and the width between the parapets would be increased from 42ft. 6in. to the width of Queen Street Place. With regard to St. Paul's Bridge, it was proposed that the southern approach to the bridge should commence at the junction of Southwark Street and Great Guildford Street. The approach was to rise by a gradual slope along Great Guildford Street, crossing over Sumner and Park Streets and Bank Side, and skirting en route the property of the City of London Electric Lighting Company. The bridge was to cross the river in three or five arched spans, with at least as much clear head room as obtained in the case of the bridges immediately up and down stream. The northern abutment was to be to the east of Trig Lane steps. The northern approach would cover Castle Yard and cross over Upper Thames Street at about 34ft. above street level. The viaduct over Queen Victoria Street was to be the highest point attained, and the structure would be at least as high above the street level as that of Ludgate Hill Bridge. From that point a gradual decline was to bring the northern approach down to the level of Cannon Street, finally emerging into Cannon Street by the warehouse of Stafford Northcote and Co., Limited. The bridge would accommodate two lines of trams, and between the parapets would be about 80ft., of which 50ft. would be carriage-way. Between Queen Victoria Street and Cannon Street, however, the roadway was to be widened by 20ft. or 30ft. to allow the trams to descend below the street level in a similar manner to that in Southampton Row.

The Saxon Cathedral at Hexham.

It was known that the ancient Abbey of Hexham stood on the site of Bishop Wilfrid's old cathedral; but as to the dimensions of that cathedral and its relation to the present structure information was scanty. Mr. C. C. Hodges, however, announces in a letter to Canon Savage that he has now discovered the complete plan of the original Saxon Cathedral. Contemporary descriptions speak of Hexham Cathedral as the largest church in England in its day. These have hitherto been regarded as exaggerated; but Mr. Hodges shows that they were not so. The extreme length of Bishop Wilfrid's building was 158ft., and its extreme breadth 80ft., and it had transepts and four towers. The plan is sufficiently similar to that of the Saxon church at Brixworth to suggest that they were designed by the same hand, though Brixworth is only 148ft. by 63ft., and possessed no transepts and only one tower. Brixworth Church, it is noted, stood on one of Bishop Wilfrid's estates in Mercia, and was certainly built some years before the Cathedral at Hexham. This last discovery regarding Bishop Wilfrid's Cathedral was made in the course of the recent work in underpinning the north transept of Hexham Church, which had proved to be unsafe in spite of the recent restoration of the building.

The Gardner Collection.

General satisfaction will be felt that the Gardner Collection, the largest and most valuable collection of prints and drawings of London, has been privately purchased by Major E. F. Coates, M.P. for Lewisham. The new owner states that the reason for his purchase was to prevent the acquisition of the collection by an American multi-millionaire. Now that the drawings are safe from the prospects of immediate dispersal, efforts should be made to raise the sum necessary to acquire them for the nation, by arrangement with Major Coates. Various suggestions have been made from time to time; one being that each of the Borough Councils should purchase those relating to their respective districts.

The R.I.B.A. New Royal Patron.

The Secretary of the Royal Institute of British Architects announces that the Prince of Wales has just signified his appreciation of the work done by the R.I.B.A. by extending his patronage to the Institute. His Royal Highness, who is leaving for South Africa for the inauguration of the Commonwealth, will perform various public functions, amongst others the opening of the new Durban Town Hall.

The Architectural Association.

The result of the election of Officers and Council for the Session 1910-1911 has been declared as follows:—

President: Mr. Arthur Keen. *Vice-Presidents*: Mr. Gerald C. Horsley and Sir A. Brumwell Thomas. *Ordinary members of the Council*: Messrs. C. C. Brewer, F. Dare Clapham, Horace Field, W. Curtis Green, Herbert A. Hall, Percy W. Lovell, Percy May, F. Winton Newman, C. Wontner Smith, and W. J. Tapper. *Hon. Treasurer*: Mr. Henry Tanner. *Editor of the Architectural Association Journal*: Mr. Allen Foxley. *Hon. Librarian*: Mr. G. G. Wornum. *Hon. Secretaries*: Mr. Edwin Gunn and Mr. G. Leonard Elkington.

Space in Elementary Schools.

The recent debate on the subject of what is called "the ten-foot space" for each pupil in elementary schools shows clearly that the Board of Education is determined to oblige all school managers to give this space of square feet to each school. This determination is to be retrospective, and will necessitate enlargements of many schools in rural and urban districts, especially of those known as non-provided schools. That this rule is desirable no one can doubt, for it was recommended by a Royal Commission so long ago as 1888, and that it will tend not only to better education but to better health among the pupils is also obvious. It is said that the managers of non-provided schools will have a serious additional burden cast upon them, but if they choose to stand outside the general system, they cannot well complain. It is to be hoped, however, that the Departmental Committee recently appointed to consider the cost of school buildings will report as soon as possible, for if any rules can be made which will tend to economy in building without diminishing the efficiency of school structures, they will be desirable at the present juncture. It was obvious from the debate that all parties are at one on the desirability of sufficient space for scholars in elementary schools, and we expect in the next year or so to see considerable enlargement of school buildings.

A Johnson Statue in the Strand.

On May 7th next the Princess Louise will unveil a bronze statue of Dr. Johnson, six feet in height, standing on an ornate black Belgian granite pedestal of a similar height, which is now being raised on the little plot of green behind the apse of the island church of St. Clement Danes. The sculptor is Mr. Percy Fitzgerald, who has edited Boswell's "Life," and who executed the statue of Boswell at Lichfield. Dr. Johnson will look straight down Fleet Street, and will be shown in the traditional costume. His right arm will be raised, while his left hand will support an open volume. There will be other books about him, together with an inkstand; while the pedestal will show a medallion of Boswell on the front and scenes from Dr. Johnson's life on either side. It will be remembered that Johnson had his pew in St. Clement Danes, and that last year a window portraying him, surrounded by his friends, was unveiled there.

A Church for Hampstead Garden Suburb.

On April 25th Lord Crewe and the Hon. W. F. D. Smith laid the foundation-stones of the church of St. Jude-on-the-Hill, which is to be built on a site on the highest part of the Hampstead Garden Suburb, given by the Hampstead Garden Suburb Trust (Limited). It is to be built of red brick in the Renaissance style, from the designs of Mr. E. L. Lutyens, and will cost £12,300. Towards this, including grants made by the Bishops of London and Islington from diocesan funds, £6,000 has already been raised. The seating accommodation will be about 1,100, and it is hoped that the first part, the Lady Chapel, will be ready for use in a few weeks' time, and that the whole will be completed in October. The Bishop of London consented to the church's being named St. Jude because of the long connection with St. Jude, Whitechapel, of Canon S. A. and Mrs. Barnett, to the latter of whom the garden suburb owes its inception. The stone of the Lady Chapel was laid by Lord Crewe with a trowel presented by Lady Byron, and one of the stones of the base of the tower was laid by Mr. Smith with a trowel presented by Lady Trafalgar. The church is to be consecrated on October 28th.

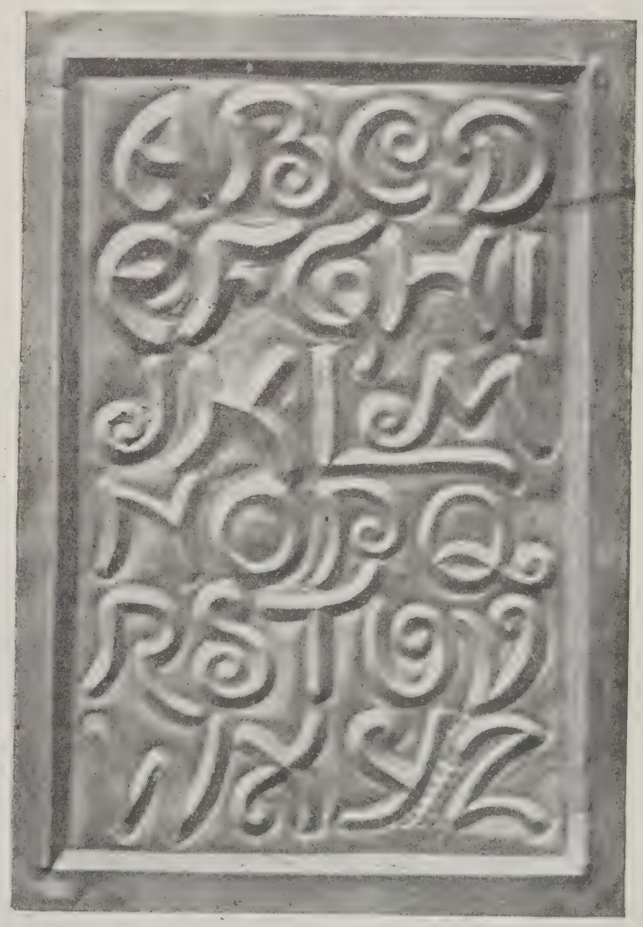

FIG. 4. ALPHABET FOR BEATEN METAL. BY LEWIS F. DAY.
(From "Alphabets, Old and New." By permission of Mr. B. T. Batsford.)

New Turner Wing at the Tate Gallery.

The new wing of the Tate Gallery is now rapidly nearing completion, and the opening ceremony will take place during the summer. The public will then have an opportunity of viewing a more comprehensive exhibition of Turner's work than it has hitherto been possible to display. In this achievement the trustees will have carried out the wishes of the late Mr. Joseph Duveen, who left the sum of £20,000 for the special purpose. The bequest has been considerably augmented through the generosity of Mr. Duveen's son, Mr. J. Duveen. The Turner section will consist of two large galleries, in which oil paintings will be exhibited. Three smaller galleries will accommodate water-colours, and below these smaller rooms there will be five others in which drawings and water-colours will be displayed. The National Gallery, which is the present repository of the Turner collection, will retain some of the representative works in oil, but the remainder will be housed in the new wing—or at least so many of them as room can be found for. There are between nineteen and twenty thousand Turner drawings and paintings in the possession of the National Gallery at the present time, and the process of final selection, preparatory to the official opening of the new wing, will therefore be a considerable task. Even at its present dimensions the Tate Gallery is only about half the size which it is hoped it may ultimately attain, and consequently the new wing has been made to follow the architectural features of the original buildings, so that when the structure is complete it will represent uniformity of design. The Turner wing has taken nearly two years to build.

St. Boniface, Antwerp.

The Gothic Church of St. Boniface, Antwerp, which was recently consecrated by the Right Rev. Dr. Wilkinson, Anglican Bishop for North and Central Europe, is described as one of the finest English churches on the Continent. It is in the Early English style, and cost about £10,000. It is in red brick, with white stone facings, and has a lofty square tower at the north-west corner. It comprises a wide centre aisle, separated from the north and south side aisles by rough red granite columns. It possesses a large well-raised chancel, with carved oak choir stalls, and the high altar is seven steps above the level of the nave. On the north side of the chancel, separated from it by a handsomely worked iron screen, is the Lady Chapel, with a second altar, which will be used for week-day services. On the south side of the chancel, separated by a similar screen, is the organ chamber. A triforium and a clerestory give the church a very lofty effect. A large stone statue of St. Boniface (presented by Sir Cecil Hertslet, the British Consul-General), with a brass giving details of his life and martyrdom, is placed at the north side of the sanctuary. The church is lighted by electricity, and has accommodation for 450 persons.

Proposed National Memorial to Alfred Stevens.

Some short time ago a letter appeared in the "Times" from Mr. Maurice W. Brockwell calling attention to the bad state of repair of Alfred Stevens's tomb in Highgate Cemetery. Alderman C. H. Curtis, of Blandford Forum, now writes to the same journal to the effect that the Blandford Town Council, on having it brought to their notice, realised at once that it was their duty and privilege to take the matter in hand, with the consent of the owners, the Misses Pegler, of Southampton, whose father was the lifelong and generous friend of Stevens. Under the superintendence of Mr. James Gamble, who designed the tomb, and who was a co-worker with Stevens, it has been thoroughly restored and improved, the whole structure being raised and another stone landing added, thus bringing it more prominently into view. The bronze tablet, which was torn away by thieves, has been replaced and gilded. Alderman Curtis pertinently asks, "Is it not time that some national memorial should be erected to the memory of this great genius, who has been justly described by those competent to judge as England's greatest sculptor and the author of the finest modern sepulchral monument in Europe?" The Alderman thinks that surely if an appeal is made to the English public funds would be forthcoming to do honour to this "painter, architect, designer, and sculptor," and provide a memorial in London and in the little Dorset town where he commenced to work at the age of ten with his father as a decorator, sign and coach panel painter. He was sent to Italy by the generosity of a few friends at the age of sixteen, where he studied for nine years, and returned to Blandford penniless, but fully imbued with the spirit of the great masters in painting and sculpture of the Renaissance period. Alderman Curtis further reminds us that at South Kensington there is now on view a collection of Stevens's works, including many models, and at the Tate Gallery may be seen some of his sketches; while Stevens's last and greatest work—the Wellington cenotaph in St. Paul's Cathedral—it is hoped will soon be completed, after many years' delay, by the addition of an equestrian figure of the Duke on his favourite charger.

More Memorial Tablets.

A memorial brass to Thomas Fuller, author of "Church History," and "Worthies of England," is to be erected in the church at Broadwindsor, West Dorset, of which Fuller was for twenty-six years the vicar. This brass is the joint tribute of British and American admirers. The funds have been collected by Mr. Telamon Cuyler, of New York and Georgia, U.S.A., and Mrs. Cuyler has arranged to unveil it later in the year. The brass, which has been executed by Messrs. Singer, of Frome, Somerset, will be erected close to the beautiful Jacobean pulpit from which Fuller preached before the Civil War. The following is the inscription:—"In memory of Thomas Fuller, B.D. Born 1608; died 1661. Author of 'Worthies of England.' Prebendary of Sarum 1631-1661; Vicar of Broadwindsor 1634-1660, whose learning, wisdom, and wit are deservedly held in high esteem on both sides of the Atlantic. Erected by a few British and American admirers, September 23, 1910—the 259th anniversary of the sojourn of King Charles II. at Broadwindsor during his flight from Worcester." The London County Council have caused a tablet to be affixed to St. Philip's Vicarage, Stepney, where at one time John Richard Green, the historian, lived. A tablet has also been affixed to No. 16, Serjeants' Inn, Temple, to commemorate the residence there of John Thaddeus Delane, formerly editor of the "Times." The tablets are of encaustic ware, and are chocolate and blue in colour respectively.

Hampshire Archæologists.

Sir William Portal, in his valedictory address as president of the Hampshire Field Club and Archæological Society, said he could not look with entire satisfaction on the recent erection of a gallery at the west end of Wykeham's Chapel at Winchester College, which cut through two of the western-most windows. It was a most unfortunate evolution of modern days and possibly modern requirements. It was inconceivable to him that the citizens of Winchester could with equanimity and composure watch the gradual demolition, for it was nothing else, of the ancient and interesting feature of the High Street, the Piazza or Pent-house, which stands on the site of the Conqueror's Palace, and he deprecated the modernising which it was undergoing. He was thankful that the ancient Bargate of Southampton still remained, and he described Mr. Lucas's proposal to take roads round it on either side as clever and ingenious. He condemned the recent erection of a porch on the north side of Romsey Abbey as being open to a great deal of criticism, commended the proposal to erect a memorial to the Pilgrim Fathers at Southampton, and suggested that a stone should be placed on the old Vicarage at Steventon to commemorate the fact that Jane Austen wrote several of her novels there.

Garden City for Woolwich Workers at Greenock.

A site of thirty acres has been marked off for the erection of a series of houses for the Woolwich artisans who have been sent to Greenock. Each house will be self-contained, and

will be modelled on English lines, with the addition that a central square plot will be left unbuilt upon to be used for ornamentation or for recreation, or what may ultimately be used as the site of a church. The plans provide for houses of five apartments — a living room or kitchen 12ft. 6in. by 10ft. 6in., a parlour 13ft. by 12ft., three sleeping rooms of varying size, and a bathroom fitted with hot and cold water. In addition there will be a combined scullery and wash-house, and a coal-house, whilst the internal fittings of each house will include kitchen ranges, room grates, and tile hearths. In front of each house will be 30ft. of ground for the growing of flowers, and behind will be 100 square yards for kitchen garden and bleaching green. It is hoped that the houses might be offered for sale at £300 to £500, and as the scheme provides for the buyer taking a bond, for two-thirds value, on the house, the burden of the buyer is reduced to a small amount.

French Architects Visit Government Buildings in London.

A party of French architects who came on a visit to London a few days ago paid special attention to the new Government offices in Charles Street, and, through the courtesy of the First Commissioner of Works, every facility was afforded them. They expressed strong admiration of the architectural features of the newer buildings, and more particularly those which are now the headquarters of the President of the Local Government Board and of the Board of Education. What particularly attracted their attention was the circular courtyard at the rear of the offices of the Minister for Education, which when completed will form a notable addition to the courtyards and quadrangles of which there are many to be seen in this part of the metropolis. The building scheme is not, of course, completed. Nearly the whole of the premises on the eastern side of Great George Street, as well as the whole of Delahay Street, has been razed to the ground, and upon the site there will be erected in due course an extension of the existing offices on what is known as the Charles Street site, which will then be taken down to the Park front. Between this and the India Office, on the stairs giving access to St. James's Park, and the Horse Guards Parade, there is to be erected the statue of Lord Clive, which is now in the hands of the sculptor.

St. Asaph Cathedral.

This cathedral seems to have furnished another instance of the careless faith with which foundations were laid in the middle ages. Serious cracks and disintegration have appeared in the building, and it is discovered that the footings of the walls are nothing more than rough stones laid in mud and with no projection. Mr. Thompson, of Peterborough—we presume a member of the building firm which has had so much experience with bad foundations at Peterborough—has been consulted, and has recommended the insertion of a concrete footing under the walls, with as wide a spread as possible, to distribute the weight, and underpinning up to the walls with hard brickwork or cement. The ground itself is said to be sinking, and reinforced concrete is proposed as the material for a continuous foundation. As far as can be judged from the reports, this seems to be the best course to pursue.

The Ironmongers' Almshouses.

In the Parliamentary Papers for Tuesday Dr. Addison asked the President of the Local Government Board whether his attention has been called to the proposal for the erection of fifteen blocks of dwellings upon the site of the Ironmongers' Almshouses in Kingsland Road, nearly an acre of which is planted with fine old trees, and has been laid out as a garden for 200 years; and, if so, what steps he proposes to take to prevent this last remaining garden city feature of Shoreditch being sacrificed to the builder in a district which has density of 540 persons per acre.

Mr. Burns says that his attention has been called to the matter, and he will communicate with the hon. member.

Mr. Chancellor further asked the Attorney-General whether, in view of the fact that in 1908 the Charity Commissioners declined in the public interest to sanction the proposed sale of the Ironmongers' Almshouses, Kingsland Road, and the erection of fifteen blocks of lofty buildings on the site thereof, after hearing the local authority, the National Trust, the Metropolitan Public Gardens Association thereon, he could see his way to lodge an appeal against the recent decision in the Court of Chancery in an action commenced before 1852, wherein the local authority and the above societies were refused a *locus standi*, so as to prevent the destruction of the last remaining garden city feature in an area where the density is 540 persons per acre.

The Attorney-General replies that he is afraid the prospects of success are not sufficient to justify him in advising the appeal suggested.

A STRINGENT FORM OF CONTRACT.

By OUR LEGAL EDITOR.

There seems to be a tendency on the part of those who employ contractors so to stiffen up their forms of contract that liability for every conceivable kind of accident or contingency is thrown on those who are to carry out the work. Indeed, it would seem that nowadays employers and building owners want to make the contractor an insurer. A correspondent draws our attention to the fact that the Leicester Corporation desires to insist on the following clause being inserted in the form of contract under which builders and contractors are invited to tender:—

"1. The contractor shall take all risks and liabilities of whatever kind, arising out of or incidental to the construction, completion, and maintenance of the works, and shall be responsible for, and shall at his own expense make good, all accidents, loss, or damage which may happen to the works, material, or plant, from any cause whatever, including (without thereby limiting the foregoing general words) accidents from fire, flood, weather, tempest, failure of soil or foundations, act of God or the King's enemies, during the construction, completion, and maintenance of the same."

Can such a clause be enforced? It is drafted with particular cunning; because it is clear that where the "act of God or the King's enemies" is not mentioned in a contract, performance is excused if it is prevented by either of these causes.

The law is thus stated in "Emden's Building Contracts" (4th edition) p. 196: "It is a rule of law that when the law creates a duty, and the party is disabled from performing it, without any default of his own, by the act of God, the law will excuse him; but when a party by his own contract creates a duty, he is bound to make it good, notwithstanding any accident, by inevitable necessity (*Nicols* v. *Marsland*, 2 Ex. D. 4). The act of God is in some cases said to excuse the breach of contract. This is, in fact, an inaccurate expression; what is meant is that it is not within the contract" (*per cur.* in *Baily* v. *De Crespigny* L.R. 4 Q.B. 180). Now in the present instance the contractor agrees to make good damage which comes about through the act of God; in other words, if he signs the contract he agrees to become an insurer. If an earthquake were to occur during the progress of the works, the liability to make good the damage would clearly be on the contractor. It is needless to say, however, that the clause is entirely without precedent. Thus we have searched among the clauses which are set out in the second volume of "Hudson on Building Contracts" without finding any clause which is anything like so stringent as this. Yet there is nothing illegal in it. The only method which contractors can adopt to secure its deletion is to band together and absolutely refuse to undertake the work on terms which include these onerous conditions.

OBITER DICTA.

The Art Rev.val. Not only in Paris and in Munich, but also in Italy, one could not help feeling that there was a great revival in modern art taking place at the present time. So far as water-colour painting was concerned the foreigner was not in it at all with the British artist.—*Sir Felix Schuster, at dinner of the Royal Society of Painters in Water Colours.*

Art and the Time Spirit. We should not allow ourselves to undervalue the men who provide for each age the kind of art which it is fitted to receive. Successive changes in critical standards are not invariably changes for the better; and to assume that a man is an indifferent artist because he is popular in his lifetime is to allow our opinion to be dictated by the vote of the crowd just as much as if we blindly followed it. Obviously, in any healthy state of society, close sympathy between artist and public should be the normal state of things, and there is something to be said for the Academy's ambition to produce a popular exhibition, even if we may think they pursue it too exclusively by providing pictures to suit their public—not enough by trying to find a public capable of appreciating the best pictures.—"*Athenæum.*"

Art in Action. We often hear now the phrase, "An artist in life," and it is a useful one if rightly used. For we must remember that the artist is always a maker of things. If he makes nothing he is only an amateur. When he dreams of the wonderful things he might have made if only he had lived in the age of Phidias, then we may be sure that in that age also he would have dreamed of the wonderful things he might have made if he had lived in the time of Homer. In any age he would have been an amateur waiting for inspiration, instead of going out to find it in action. The great artists, like the great heroes, have always done whatever came to hand. Michelangelo grumbled and said he was a sculptor when Julius II. set him to paint, but he painted the roof of the Sistine Chapel. . . Ideals are really purposes—man's purposes, as opposed to the purpose, or want of purpose, of Nature. And purpose without action is always incomplete. — "*Times*" *Leading Article.*

A Danger to Municipal Life. One of the features of legislation, not only in 1909, but for several years past, has been the increasing desire on the part of the Government Departments to obtain more or less absolute control over local authorities. That is one of the greatest dangers threatening municipal life at the present time, and unless it is faced it will go far towards depriving municipalities of that reasonable degree of independence which they had enjoyed in the past. While we do not object to reasonable control in such matters as the making of new by-laws and the borrowing of money, the action of the Government Departments is, according to the modern practice, going much too far in that they seek to interfere in matters of administration frequently of a comparatively trivial character, which ought to be left to the persons elected for the purpose, and in that they seek to take the initiative and to force local authorities into action against their wishes. Examples of those tendencies are to be found in the Housing and Town Planning Act and in the Milk and Dairies Bill. If that policy of centralization is continued, one of the results will inevitably be that sooner or later the men most able and suitable to adminster local affairs will cease to become members of town councils.—*Mr. Harmood-Banner, M.P., at the annual meeting of the Association of Municipal Corporations.*

BUILDING BY-LAWS.

[*Mr. R. M. Lucas, F.R.I.B.A., delivered a lecture on Building By-Laws before The British Constitution Association, on April 25. Sir William Chance, Bart., presided.*]

The diversity of the by-laws was the first point dealt with by the lecturer. He showed that the building rights of one landowner under Statutory Law were often entirely different from those of a neighbour within the boundary of another district. The parent type of all the modern codes he considered was to be found in the "Rules and Direction for re-edifying the City," embodied in an Act of Parliament passed immediately after the Great Fire of 1666. Not only were they found to give the form to English By-laws of to-day, but to some extent they anticipated a recent Town Planning Bill. London had been suddenly reduced to the most "ripe" and "eligible" of building estates, and without a regulating code of by-laws the rush of builders would have resulted in utter confusion. The present system of by-laws is bound up with the congestion caused by the great townward movement of the last century.

Their Unsuitability.

The present by-laws were shown to be unnecessary and even unsuited to bring about good building. After examples of their absurd inconsistencies had been given, the broad distinction between constructive and sanitary by-laws was pointed out, the former concerning the individual and the latter the community as well, a distinction which had been overlooked by those who framed them. As an instance of how building is improved by public opinion and the builders' enterprise, the lecturer instanced the use of the hollow external wall, now almost universal wherever bricks are of the porous kind, even in the cheapest cottages, although it costs slightly more to build than a solid wall, and is not an improvement that makes any display of its worth, its merit being that it conduces to dryness and warmth in the house. Not only did no by-laws enforce this method of building, but many did not even mention it, and the fact of their not doing so had actually been used as an argument against its use.

Stoppage of Good Building.

The good service of by-laws in stopping the not very widespread evil of jerry-building was discounted by the discouragement caused to honest builders, who in some rural districts have to deposit two complete sets of plans and sections, plans of the site and of the neighbouring properties, sometimes involving quite an expensive survey, and sections of land and drainage details, before their applications are even considered; while all through their work they were subjected to the interference of officials on the look-out for any technical breach of the vaguely-worded by-laws, officials upon whose decision the fines and penalties practically depended. If permission to build was not granted, the builder had as yet no way of proving his right to it except by building at the risk of having his house pulled down. A scheme for reform was suggested in outline by the lecturer, involving a radical change in the character of the whole system. Instead of the work of the surveyors being punitive as it is now, he would have it made *educative*. Provided that a man observed the sanitary by-laws, the Public Health Acts, and the Common Law, he should be as free to build as to plant a tree, dig a well, or make a speech. He should merely have to give notice to the District Surveyor and to apply to him for a schedule of building instructions which could be kept up to date by leaflets similar to those supplied by the Board of Agriculture to farmers. On completion of a house, the surveyor should write a certificate of merit or demerit to be displayed to intending purchasers, tenants, and mortgagees. A reasonable right of appeal against the surveyor should be open to builders. Compliance with the instructions would not be obligatory, though obviously to their interest, as the value of a property would be discounted by an adverse report. Only work actually unsafe or likely to become so without warning should be pulled down. By these proposals jerry-building would be prevented, honest building encouraged, and both the public and builders protected and educated. Those surveyors whose qualifications would not bear examination would not like this scheme, but intelligent well-trained men would have far more interesting and worthy employment under it.

Mr. George Hubbard, Mr. Mark H. Judge, the Hon. Ernest Pomeroy, Mr. Russ, and others took part in the animated discussion which followed, and the lecturer concluded by replying to the questions and criticisms.

LONDON MASTER BUILDERS' ASSOCIATION.

The Council met on the 21st April, 1910, when the President (Mr. Leonard Horner) occupied the chair.

The Organisation Committee, of which Mr. F. Higgs was re-appointed chairman, reported that the canvassing among builders and contractors who are not members of the Association was meeting with success, and several firms have joined. The committee also suggested a standard to be observed in accepting Associate Members, and the suggestion was adopted by the Council.

Some cases were reported of estimates being called for for large works without quantities being supplied, together with one instance where the bills of quantities had to accompany the tender. The objections of the Association to such proceedings were forwarded to the architect in each case with satisfactory results.

In response to a request from the Board of Trade, Mr. Wm. Shepherd, Mr. F. G. Rice, and Mr. Walter Lawrence, jun., were nominated to represent this association on the Advisory Committee for London about to be formed in connection with the Labour Exchanges.

Arrangements were made as to answering enquiries from the American Vice-Consul with regard to the working of the Workmen's Compensation Act, 1909. Further instructions were given in connection with the new offices in Kingsway. Correspondence with the L.C.C. as to contractors having to take out their own quantities was read and approved. Correspondence relating to slating and roof tiling and other matters of trade interest were considered.

Photo : "Architectural Review" Photo. Bureau

It is satisfactory to learn that the Office of Woods and Forests are resolved that the new front of the building (seen projecting on the right) which is to be set back (under the Piccadilly widening proposals), is to be a repetition of the projecting wing of the Piccadilly Hotel on the left of the picture. The fine block will therefore be completed as arranged by Mr. Norman Shaw.

ART, ARCHITECTURE, AND AND THE ASSISTANT.

By E. J. DIXON, A.R.I.B.A

[This paper was read to the Guild of Architects' Assistants by their Hon. Secretary at a meeting presided over by Mr. J. V. Hibbert, F.S.I. Mr. Dixon, before commencing his paper, referred to the newly constituted "Licentiate, R.I.B.A." which, he said, was a step in the direction of organising the profession in a proper manner. The principal contention of the Guild—not without foundation, we think—rests on the changing conditions in the architectural profession. It is declared that the opportunities for assistants eventually becoming principals are immeasurably decreased; that a very large number have no hope beyond being assistants all their lives; and that the needs, and in fact the existence of this class, generally badly paid and casually employed, is entirely ignored in official circles.]

The first glimmer in the official mind of the existence of the architect's assistant, as we know him, was exhibited in the address of Mr. Walter Cave at the Architectural Association nearly two years ago, and the measures taken by that body in reference to the state of unemployment, as exhibited by their register, indicate the desire for protection so widespread in the profession at the present time, and of which the measures taken by the Royal Institute cannot be too generously praised. But, previous to Mr. Cave's address, and since, the official view of the assistant as a person of private resource apart from the salary he receives for his work has been the predominant one. In listening to presidential addresses one after another, one wonders whether presidents live in another world, whether their productions in this direction are intended as an impertinence, a gross piece of sarcasm by tacit inference to their audiences, who principally consist of the struggling assistant who often finds it a matter of difficulty to pay his annual subscription, or thirdly, whether the assistant is considered so unimportant as to deserve no recognition from the presidential point of view, except as a student.

The Menace to the Profession.

The existence of a large class, much larger than one would suspect, wretchedly paid, quite unrepresented in any society, and having no means whereby their position may be bettered, is a standing menace to the profession as it concerns the assistant, for it means the lowering of the salary and status of the better men, and more casual employment. In many offices men of this class are employed at insignificant salaries (with a paid assistant brought in at intervals to do any creative work, tutor the pupils and backward assistants), and are politely dismissed when the term of their usefulness is past. As a student the assistant has always been interested in matters of art, and especially in relationship to his profession. From the point of view of individual development the study of art is essential, but art in relation to the assistant and to our profession, as matters stand at present, is besmirched with cant and hypocrisy. One cannot but regard the manner in which the cant of art has grown up in our profession, as one of the most important signs of the times, whereby the selfish business man talks insincerely of art in order to blind his sincerely artistic confrères to his real aims; those aims, of course, being those of any profession or business devoid of an appeal to the emotions in the way that art appeals to any architect who sincerely believes in his work.

The Only Opportunity.

The assistant has only the full opportunity of showing his knowledge of the art of architecture when either the cunning, carelessness, laziness, or lack of ability of his principal will allow—a condition of things which often prevails in public offices, where an engineer reaps prestige from the work of an unknown architectural assistant. Art appears to have reached a precarious stage in the profession of architecture. The disciples are busy imitating and collecting from the masters, and the masters are busy in an ostensible game of bluff, that of imitating themselves; so that the final result of the latter's work is little above the average of their disciples.

To describe the present position of the profession of architecture towards art as that of a mere superficial relationship, will probably astonish a few, disgust many, and be looked upon as the idle prattle of an imbecile by others. To describe that relationship as suspiciously dishonest is probably much nearer the truth: and to frankly describe it as dishonest is probably the expression of outspoken sincerity. Those well-known aphorisms so dear to some of us—architecture, "the mistress art," "the mother of all the arts," "architecture not a profession but an art"—have been heard so many times that, had we no genuine basis for our belief in them, the mere repetition would have engendered it. The purely artistic phases of the profession, Grand Manner or No Grand Manner, Decorated Construction or Constructed Decoration, are gradually being narrowed to the position the question of religion popularly occupies; if we are Methodists we buy our bread from a Methodist baker, and if we are Calvinists we feel intense remorse in purchasing goods sold by a grocer who contemns the Five Points. Likewise the Grand Manner disciples gaze with silent disgust on the followers of the cottage cult. All this is very pleasing and amusing, but its economic aspect as affecting the assistant is scarcely worth further reference except in a very few exceptional cases. The most noticeable feature in many of the ardent and talkative adherents of any of the schools of architecture is, that if their principles differ, their work has much in common and usually finds ample shelter under the title "Early Victorian."

As all true camp followers of the art of architecture, the members of this Guild of Assistants duly subscribe to the common declaration of faith which we recite with all due solemnity as our professional fathers have taught us. We do not desire to drag the art of architecture from the high place it occupies, or to trail even the hem of the garments of the Mistress Art in the dust. One would have thought that the position of the art of architecture was sufficiently well established to resist the breath of scandal from any quarter; but it has ever been a commonplace that the gods should be strictly respected, and protected in their implied sufficiency from blasphemous influence.

The Sources of the Evils.

We are not deeply concerned in the small talk of architecture, and as a guild of assistants we desire to study the profession of architecture as it really is, and to discover the sources of the evils we know and feel the effects of; let us leave for a moment the attractive thesis of the art of architecture and examine the less attractive but more engrossing one of the profession of architecture. The principal and the assistant of fifty years ago might be described as standing on the same plane as regards rank and social position, and in a relationship somewhat of tutor and pupil, the latter being practically certain, if he persevered, of reaching the same or, perhaps, a higher position in the profession than his tutor. It is not implied that the service of architecture was entirely the object, for many of the older practitioners have left some goodly sums of money amassed in the service of architecture. The advent of the modern assistant, a man with little or no financial backing and depending solely on his salary to live, was gradual, but eventually he numerically swamped the older class and often proved himself more capable. He immediately endeavoured to imitate the older men; he adopted their superstitions, their habits, and their prejudices. This kind of thing is not, of course, unknown in other walks of life. It is a common social phenomenon. The promoters of any new movement on behalf of any section have, as their initial difficulty, their first obstacle, the prejudices borrowed from the social strata immediately above. The architect's assistant of the present day quickly finds himself in the same position as the wage earners in any other business, due precisely to the same causes. He has hitherto found his prejudices too strong to permit him to combine in his own interests, to recognise, in short, that his position as assistant is rapidly becoming a permanent one, that the possibilities of becoming a principal grows less as he grows older. Signs are not wanting that the principal outlet for the energies of the assistant, the open competition, is gradually becoming limited, either to districts, or more often to architects in practice. I do not think that, in thus rapidly sketching the history of the architect's assistant, I have in any way overdrawn the real state of affairs in the profession as it concerns him. Once granting the truth of this account of the present position of the architect's assistant, it would appear that the only common-sense course to adopt, if no escape from the profession is available, would be to render it as congenial as possible, to recognise the probable limitations of one's genius, without attempting to render null and void any ambition one may possess. The first point to be noticed in assuming this view of the assistant's place in the profession is the fact that nothing definite can be achieved without organisation of some kind or other, and the painful fact that the existing societies are composed of principals or those who are in full possession of the illusion that they will be principals; and, secondly, that a deplorable reception awaits the man who would take up cudgels on behalf of the assistant in such a foreign atmosphere. The question then, for all assistants to decide is the kind of organisation they will select, the work they propose to commit to its care, and the manner of its execution.

The Proposals of the Guild.

The Guild of Architects' Assistants proposes to unite all those who have any title whatever to that designation. It proposes to unite them socially, as a matter of course; and, secondly, it has proposed a programme whereby the

many grievances under which the assistant struggles, and which, before recognising his position as practically that of a mere casual labourer with practically the same wage, he regarded as the necessary struggle of the architectural pilgrim on his way to achieve the crown of a future practice. This programme has now been before the public for the past eighteen months. It proposes to endeavour to do something in the matter of (1) salaries, (2) office hours, (3) office conditions, (4) recognition of an assistant's work where possible, and (5) legal assistance, (6) unemployment bureaux and insurance, (7) education. The Guild will endeavour to carry out the proposals by means of combination, necessitating strength of numbers, and conference with existing societies and principals, necessitating tact and toleration. There are many other advantages a keen, solid combination such as this will immediately suggest, such as parliamentary and municipal action, it being usually found an easier matter to effect changes in the domestic affairs of public bodies by means of correspondence and deputations than in the case of private employers. Bringing forward matters which immediately affect the well-being of the assistant to the notice of existing bodies would have the effect of stimulating the interests of assistants who are members of those bodies.

The Fear of Trade Unionism.

The inclusion of principals who are interested in this, which the Guild trust will become *the* important phase of architectural politics, will provide the necessary element of experience and breadth which such a movement as ours demands. The principal finds it necessary protection for his own interests against the guerilla warfare carried on by the unruly members of his class, by taking refuge within the folds of a Registration Bill; but the assistant feels doubtful as to whether he should combine in like manner, and for exactly similar reasons. You see, "we don't intend to remain assistants: we shall one day be principals," and then "the idea of combination is so like trade unionism, which, of course, is a thing we must not dream of." There are some of us, however, who, after noticing the gradual removal of the elderly assistant who has failed to arrive, desire to bring all assistants together within a bond of their own interests, for their own progress and betterment. Whatever is bad in combination, let us exhibit enough sense to reject, and whatever is good let us hold fast to, whatever borrowed prejudices may be wrecked in the struggle.

To begin with, this Guild of Architects' Assistants welcomes the advice, help, and assistance of all principals who are really interested in the welfare and fate of the assistant. They are able to see the assistant from the business point of view, to appreciate the value of a good assistant and to condemn the incompetence of a poor one. All principals interested in the better organisation of the profession generally will welcome the advent of any well-considered scheme which redounds to their benefit, which will select, classify, and secure to them the best assistant available on the market, instead of continuing the present method of trial and error, in engaging assistants. Principals will recognise that the assistants are even more interested in any sound scheme for the protection of the profession than they are themselves, that they form a potent numerical factor in all societies, and consequently represent an interest which, if well organised, would unquestionably prove of great value in any movement in the direction of the real reform of the profession or the improved status of its units.

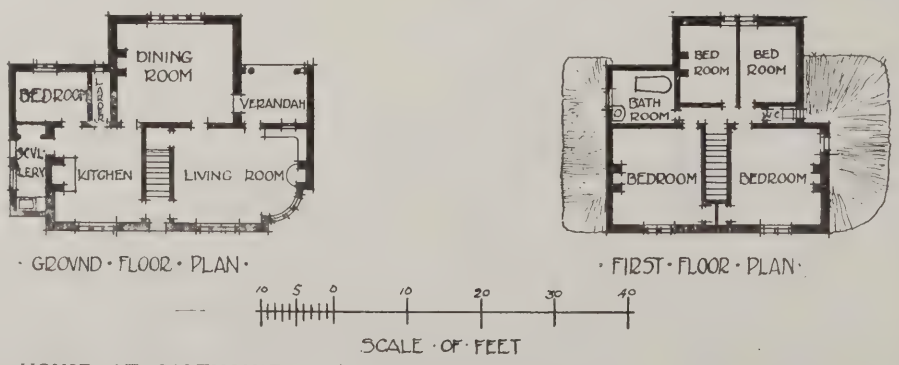
A Broad Definition.

We make no attempt to strictly define the term "Architect's Assistant," regarding as such all who are engaged in the practice of the construction of building and who may be likely to compete with us in business life, for any class of work, building or architecture. We want to make the term "Architect's Assistant" as broad as possible, leaving it to the commonsense of those who desire to join to supply their own reasons for inclusion.

Apart from the economic reasons for the Guild of Architects' Assistants, a further and, perhaps, more powerful one may be brought forward to justify our existence, and that is the "social" reason. We are the only "Society of Architects' Assistants," the only architectural society having for its primary object the maintenance of the status of assistants. As all other existing societies place the principals' interests first and the assistants' last, so we fill a place in the profession by providing for and maintaining the assistants' interests, and those not without deference to the principal, whom we ask to join and assist us. We have continually reiterated that we have no desire to compete in any way with other societies, but to collaborate and work with and within them. Unfortunately the fact that we must receive subscriptions if we want to live constitutes in some way a challenge to other societies, but we have endeavoured to minimise this possible source of irritation to as low a figure as possible, (1) in order to allow our members to remain in existing societies and to work within them, (2) to avoid as much as possible any appearance of competition with other societies. Any similarity that may be apparent in the aims of the Guild in comparison with those of other societies demonstrates first, that no radical difference exists; secondly, that the proposals of other societies in relation primarily to the principal are exactly similar to ours in relation to the assistant; and thirdly, the social aspect, that of providing an assistants' society, is exactly similar to that of other societies.

In conclusion, therefore, it is our hope that the Guild of Architects' Assistants, by presenting the assistants' case in an organised fashion to existing bodies, besides carrying out that section of the work which is peculiarly its own, will form a useful cement to existing professional opinion, even if it may not eventually aspire to the position of an important feature in the professional structure itself.

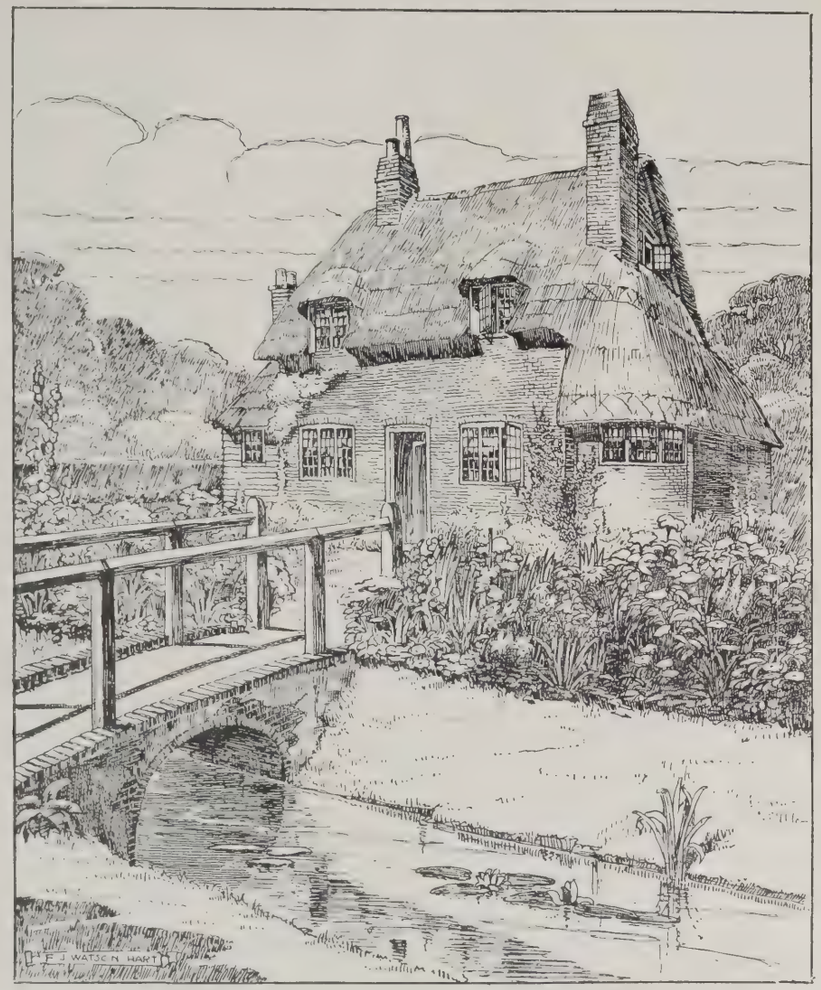
SOME RECENT DOMESTIC WORK.



FAIR AND MYER, ARCHITECTS.

On the opposite and following pages we illustrate some minor domestic work, designed by Messrs. Fair and Myer, of 39, Furnival Street, London, E.C. Of the six works shown, four are comparatively small houses, the exceptions being those at Crawley, Sussex, and Sheringham, Norfolk, which have twelve and eleven bedrooms respectively, but the houses illustrate a considerable range of treatment, and are pleasing examples of modern English domestic architecture.

The cottage at Salthouse Bay, Norfolk, is a week-end home designed for a professional man at Peterborough. The waterway seen in the foreground is one of the little drains found in the fen district, and the bridge which has been constructed over it, to give access to the house, is built of old bricks. As regards style the local cottage character has been adhered to, old bricks being used for facing the walls; the roof is covered with thatch, being placed over galvanised iron sheeting, which has been used for fire-proofing purposes. The interior has all the woodwork stained dark; the fireplaces and ingle are built in rough old bricks. The verandah is brick paved. As regards plan the living-room has a corner window to command a view, and the kitchen is conveniently placed, both for the dining-room and entrance doorway. The bedroom off the kitchen has been arranged for a permanent caretaker living in the cottage, so that the owner may be relieved of any difficulty as to the safety of the place during his absence.



The house at Sheringham, Norfolk, is another seacoast dwelling, built of bricks with fused headers forming patterns. The roof is covered with pantiles. The windows have brick mullions with wooden frames and casements behind. Internally the hall is panelled in elm, and has a fibrous plaster ceiling. The dining-room is panelled in walnut, with coned and enriched ceiling. The drawing-room and library have panelled walls, painted white, and slight enrichment to the ceilings. The garden has been laid out on geometrical lines, and all trees found on the site have been retained. As regards the plan, the large hall has the dining-room on the right and the drawing-room and small library opening off on the left. The kitchen and offices are shut off from the rest of the house, entrance from them to the hall being arranged through the servants' hall; there is also a serving entrance from the kitchen passage to the dining-room. On the first floor are seven bedrooms, a dressing-room and bath-room, and there are four bedrooms in the roof.

The house at Crawley, Sussex is situated on undulating ground, falling

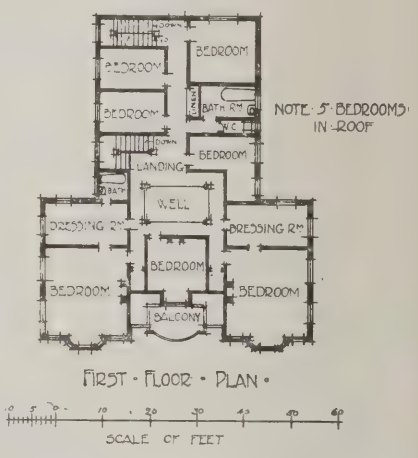
HOUSE AT SHERINGHAM, NORFOLK. FAIR AND MYER ARCHITECTS.

towards the south. The exterior is faced with sand stocks of mixed colours with wooden cornice painted white, and the roof is covered with hand-made tiles. The woodwork to windows, etc., is painted white. The interior is Georgian in character, the hall being panelled in walnut, with gallery over, and walnut staircase. The dining-room is panelled in unpolished oak, and has an enriched ceiling. The library and drawing-room are panelled and finished white, with enriched ceilings. Large dressing-rooms are arranged in connection with the principal bedrooms. The motor garage and stables are situate adjoining the lodge. The garden has been specially designed to suit the site, and the pergola has roughly plastered columns, with reinforced concrete beams and rough cross-rails, all whitewashed.



The house on the Chiltern Hills is situated some few miles from Reading, and is built on the site of an uninteresting cottage in an old garden. The exterior is whitewashed, and old tiles are used on the roof. The interior has been finished in a cottage-like character with brick fireplaces, whitewashed beamed ceilings, batten doors with thumb latches. All the walls are finished with buff distemper. The plan is very compact, and shows, on the ground floor, a small hall with dining hall with dining-room and drawing-room on either hand, kitchen and scullery. On the upper floor are four bedrooms and bath-room. The lavatory and w.c.'s are conveniently planned off the staircase.

The house at Braywick Road, Maidenhead, is another small dwelling with a compact plan, with drawing-room, dining-room, library, kitchen, and offices on the ground floor, and five bedrooms, bath-room and box space on the upper floor. The exterior has a red brick base, with rough-cast above, trowelled face and whitewashed, and the roof is covered with sand-faced tiles. Internally, the hall and dining-room have beamed ceilings stained dark, the ingle to the dining-room being panelled in walnut. The drawing-room is panelled and painted white, and the bath-room has a canopy bath and special fittings.

Another week-end retreat is the cottage at Overton, Cheshire; the design being based upon those of other cottages in the district. The exterior woodwork is very

GROUND · FLOOR · PLAN

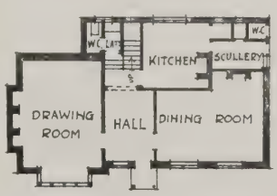
FIRST · FLOOR · PLAN ·

HOUSE AT CRAWLEY, SUSSEX. FAIR AND MYER, ARCHITECTS.

coarsely tarred, and the plaster-filling finished white. The roof is covered with old stone flags and ridges. The rainwater gutters and pipes are in wood, with wood hangers. The interior has beamed ceilings

This house is faced with sand stock of mixed colours The cornice and other exterior woodwork is painted white, and the roof is covered with hand-made tiles.

HOUSE AT CRAWLEY, SUSSEX. FAIR AND MYER, ARCHITECTS.

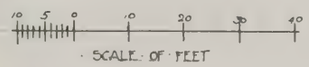


This house is built on the site of an uninteresting cottage in an old garden. The exterior is whitewashed, and old tiles are used on the roof.

COTTAGE ON THE CHILTERN HILLS. FAIR AND MYER, ARCHITECTS.

and batten doors, and the ingle nooks are finished in brick. A motor shed, etc., has been erected behind the house. Considerable thought has been expended on the garden, which has been planted with old-world shrubs and flowers. All the old trees in the grounds have been left undisturbed. As regards the plan the arrangement is compact and well-arranged, the kitchen being conveniently placed both for the front door and the dining-room. There is a large living-room, with doors opening into the dining-room, so that the two rooms can be thrown into one large room. On the upper floor are three bedrooms and bath-room.

A feature of all the houses is the good placing of the bath-rooms, which are placed over or close to the kitchens, thus ensuring that there are no long lines of pipes in which the hot water may lose heat. The kitchens are well considered, with regard both to the dining-rooms and the entrance doors. In one or two cases the ranges are placed with a right-hand light; we think it would be desirable to continue them always with light on the left-hand.



The cottages illustrated appear to us to conform felicitously to the doctrine—which, however, we are very far from desiring to push to the ridiculous extremes to which it is sometimes forced—that a building should be, as it were, racy of the soil whence it springs. The treatment and the materials are in each case sympathetic with the spirit of the locality in which the building has been reared.

NEWS IN BRIEF.

The Hampton Court Palace Astronomical Clock, which has been thoroughly overhauled and repaired, is now in going order.

* * *

The expansion of cracks of long standing, and the appearance of a further crack, in the walls of the south transept of St. Asaph Cathedral, have rendered imperative immediate works of repair, at an estimated cost of between £700 and £800.

* * *

In connection with the Winchester Cathedral Preservation Fund, £87,148 has been received. About £11,851 is still required.

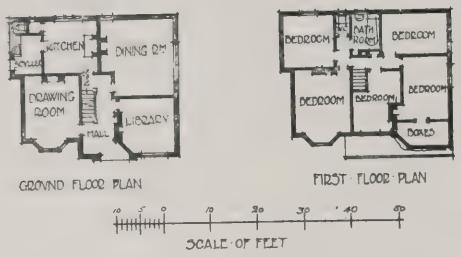
* * *

The annual loan exhibition of the prize drawings of the Royal Institute of British Architects, which are sent on circuit to provincial cities, has been on view in the rooms of the Institution of Engineers and Shipbuilders, Elmbank Crescent, Glasgow, under the auspices of the Glasgow Institute of Architects. It will be remembered that Glasgow architectural students won prizes in the Tite competition for Italian design and for measured drawings of the Wellington Monument in St. Paul's.

* * *

In a competition for a design for a clock tower to be erected as a British memorial of the Argentine Centenary in Buenos Aires, the first prize (2,000 dols.) has been awarded to Mr. Ambrose Poynter, F.R.I.B.A.; the second prize (1,000 dols.) to Mr. G. Lauristen Conder, F.R.I.B.A. The tower will be 230ft. high, the clock tower being 150ft. above the ground. The base is to be 50ft. square, and constructed of grey stone, but the superstructure is to be of red brick. Bells will chime the quarters, and the hour-bell will be the largest and highest in South America. The cost will amount to between £30,000 and £40,000.

* * *



Mr. C. H. B. Quennell, F.R.I.B.A., notifies that, as from April 18th, his address will be 21, Great Peter Street, Westminster, in the building of the National Society. His telephone number is Westminster 6162.

* * *

It appears from the Board of Trade returns that the total number of Labour Exchanges which commenced operations was 93. The total number of applications during February was 216,813. The proportion of vacancies filled to the number of vacancies notified has risen from 60 per cent. in February to 69 per cent. in March. The largest percentages of vacancies filled are: Building works and construction, 17.7; metals, machines, etc., 13.5; conveyance, 12.9; general labourers, 10.9.

* * *

The annual meeting of the Leeds and Yorkshire Architectural Society was held on April 13th, at their premises in Park Street, the new President (Mr. S. D. Kitson)

HOUSE BRAYWICK ROAD, MAIDENHEAD. FAIR AND MYER, ARCHITECTS.

occupying the chair. The report showed that the total membership of the society was 167, as compared with 165 for last year. The school for architecture, held under the auspices of the society in connection with the Leeds Institute, was proving of great advantage to associates in preparing them for the A.R.I.B.A. examinations. A Town Planning Committee had also been formed. The balance sheet showed cash in hand and at the bank amounting to £37.

* * *

The large sanatorium which has been built on the western summit of the Mount of Olives for the benefit of German and other missionaries, and was inaugurated by the Kaiser's son, Prince Eitel Friedrich, whose mother, the Empress, is the foundress, has cost about £80,000 to build. It commands a magnificent view of the Holy City on one side, and the Jordan Valley, Dead Sea, and Mountains of Moab on the other.

* * *

Last June Mr. Banister Fletcher was called upon to examine and advise upon the buttresses in the Banqueting Hall of Croydon Old Palace. He found it imperative that they should be speedily attended to. Since January the work of rebuilding them and looking after the walls generally has been in progress. The fine old Banqueting Hall is the oldest building in Croydon, dating from the thirteenth century. At one time it had fallen to the low estate of a cart shed, but was rescued and became once more one of the chief beauties of the whole building.

* * *

Perth General Station is to be re-roofed, the joint committees of the several railways having placed the contract with Messrs. Alexander Finlay and Co., bridge builders, Motherwell. The new roof will extend over a length of about 800ft., and the maximum width will be about 68ft. The work has been designed by Mr. Donald A. Matheson, engineer-in-chief of the Caledonian Railway Company.

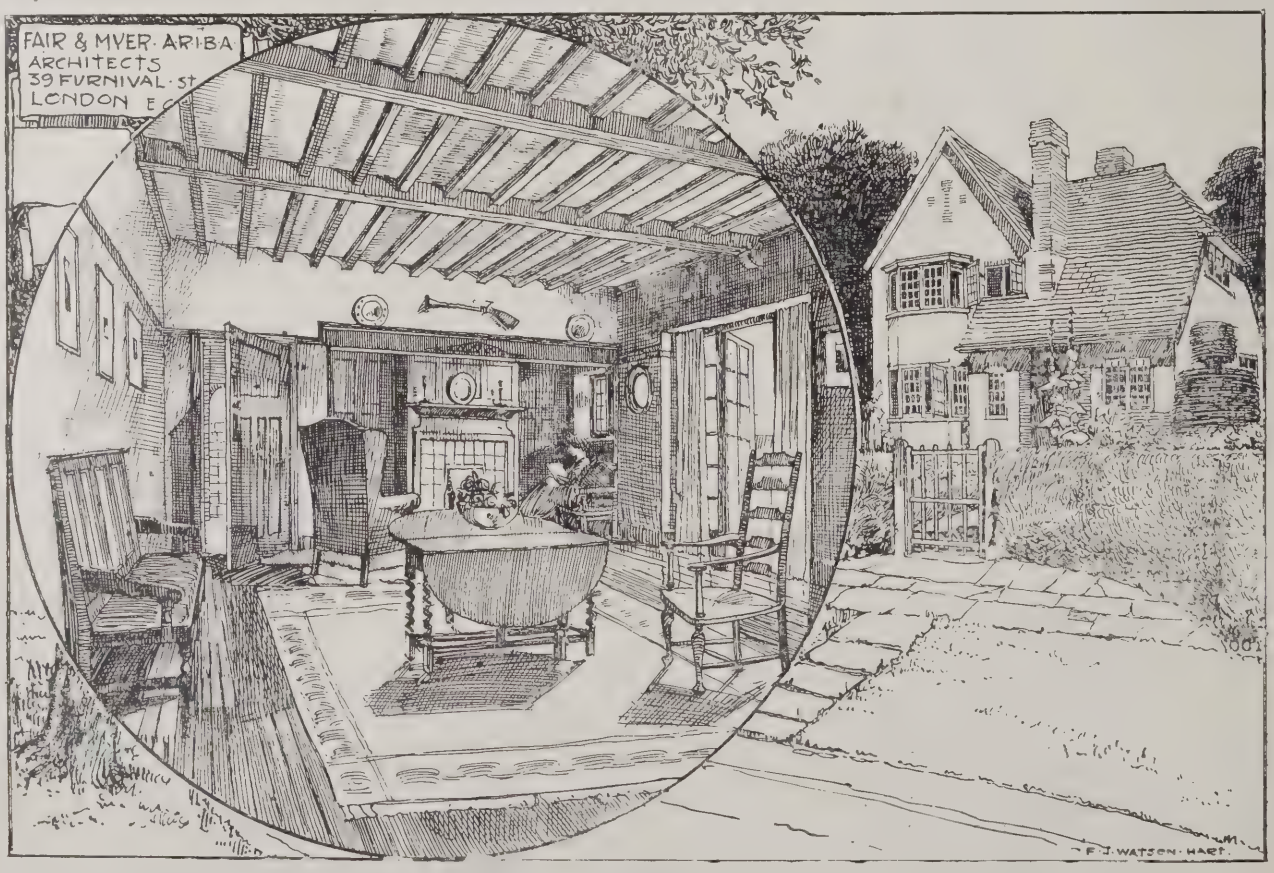
* * *

The officers of the American Institute of Architects for 1910 are as follows:—President, Mr. Irving K. Pond, Chicago; first vice-president, Mr. Walter Cook, New York; second vice-president, Mr. Edgar V. Seeler, Philadelphia. The Executive Committee comprises Mr. Pond, Mr. Glenn Brown (the secretary and treasurer of the Institute), Washington; Messrs. Walter Cook, John M. Carrère, New York; and R. Clipston Sturgis, Boston.

* * *

Messrs. T. C. and E. C. Jack announce an entirely new work on British Costume: Civil and Ecclesiastical, by Mrs. Charles H. Ashdown, well known as a lecturer upon costume and as adviser in connection with many recent pageants. The work will aim at being exhaustive, yet compact in form. It will contain several hundred illustrations, besides plates in colour.

LEGAL POINTS.



By THE LEGAL EDITOR.

The Right to use the Title "M.S.A."

A case heard in the Chancery Division last week demonstrates once more how futile it is for the members of certain of the professions to try to protect themselves in the use of their titles. An action was brought by the Society of Architects to restrain the defendant from using the title "M.S.A." It was alleged that the defendant, a builder and architect, who was not a member of the society, had used the letters "M.S.A." in the course of his profession, and that what he did would tend to damage the interests of the society.

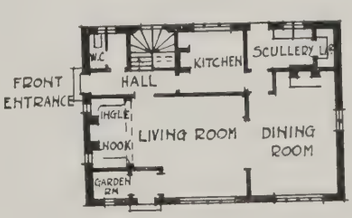
It appeared that the plaintiff society was incorporated in 1893 under the Companies Acts as a company limited by guarantee and not having a capital divided into shares. Its objects, as stated in the memorandum of association, were (*inter alia*): "The promotion and advancement of architectural art and practice and its allied arts, sciences, and crafts; and the maintenance of the honour and interests of the profession of architect are by the aid of all or any of the following: (a) To hold periodical or other meetings of the members of the society and of the architectural profession generally. . . (b) To support and protect the character, status, and interest of the architectural profession, particularly of members for the time being of the society. . . ." Under the articles the society was to consist of honorary members, retired members, and students. Members were to pay an entrance fee and a subscription of two guineas.

It was declared in the statement of claim that from the foundation of the society members had been accustomed to designate themselves for professional purposes, and had adopted and used as their professional designation the term "Members of the Society of Architects." It was further alleged that the high standard of

HOUSE, BRAYWICK ROAD MAIDENHEAD. GENERAL VIEW, AND VIEW OF DINING ROOM.

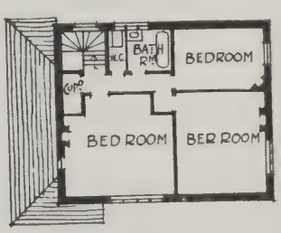
COTTAGE AT OVERTON, CHESHIRE.

proficiency and conduct which the society had laid down for its members, and which the members had to the knowledge of the public consistently maintained, had given to the letters "M.S.A." a definite meaning and value in the minds of the public; and that these letters represented to the public that the person using them was a member of the society. If the letters were used by persons who were not members of the society, the society and its members would, as it was alleged, be brought into discredit, and the value of the letters would be destroyed and the object of the society frustrated.



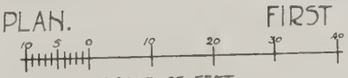
The defendant did not appear, and the "end justified the proceedings" so far as he was concerned, for Mr. Justice Joyce dismissed the action. In giving judgment, he said: "In my opinion this is one of those cases in which the matter is too trivial for the granting of an injunction. Further, with reference to the case of 'Society of Accountants and Auditors v. Goodway,' the facts there were very different, and the Scotch case upon which Mr. Justice Warrington relied is the case of a corporation established by Royal Charter. This is the case of a private joint-stock company, which for payment purposed to give people the right to use a certain combination of mystic letters, the meaning of which, I venture to say, nobody in the Court, except counsel for the plaintiffs, knew. If the decision in 'Society of Accountants and Auditors v. Goodway' was right, it certainly ought not to be extended." Engineers who have cherished the hope that the Courts are in a position to give them some protection in the use of their titles, will read this decision with some dismay.

Liability in a Lump Sum Contract.



Nearly every contract contains a clause providing that the builder (or contractor) must not rely on any representation made in plans or elsewhere, but must ascertain and judge of the facts for himself. It is satisfactory to note, however, that there is a tendency to modify the rigour of clauses of this kind in favour of contractors. Thus in a case decided in 1907 it was held by the House of Lords that if statements or representations are made in plans and drawings which turn out to be fraudulent, the person making them cannot escape responsibility by providing that the other party shall not rely upon them. As the Lord Chancellor said: Such a clause "contemplates honesty on both sides, and protects only against honest mistakes." A most useful example of the application of this salutary rule is furnished by a recent Scotch case, in which the pursuers had contracted to do certain work, which included a large amount of excavating and embanking, for a lump sum. Owing to these bores being inaccurate, the contractor had 75 per cent. more hard cutting to do than he anticipated. The contractors, having sustained enormous loss, claimed that the contract might be set aside on the ground of what really amounted to misrepresentation, and prepared a claim based on measure and value. The Court of Session has allowed this.

Complete Building Not According to Approved Plans.



In a case before the King's Heath Bench a builder was summoned for failing to submit complete plans of a skating rink; also with failing to construct stairs and supports to a gallery of incombustible material; with building a wall not of an incombustible material, and with failing to provide a roof of incombustible material. The three first summonses were heard together; the last, relating to the roof, separately. It was urged by the King's Norton and Northfleet Urban Council that though the defendant had submitted plans, the building was not erected in accordance with them. No gallery had been shown on the deposited plans, but one capable of holding 200 people had been erected, with wooden stairs, which, under the by-laws, were not permitted in this class of building. The west wall of the building was built of wood, 5½ inches thick, though shown on the plans as a 13½in. brick wall. This wooden wall had since been replaced by a brick one, it being stated that the wooden wall was only temporary. Defendant had also agreed with representatives of the Council to carry out certain work with the object of meeting their requirements; and it was stated that the stairs were in course of removal. The Bench dismissed the case as to the temporary wall, and convicted in the case of the other two summonses, inflicting fines of 50s. and costs in each case. The question of the roofing was then considered, and the contention of the Council that it was of a combustible nature was strongly contested, the defence calling expert witnesses on the point. On behalf of the Council it was stated that if the roofing material, which is of American manufacture, had been covered with an inch of cement, as recommended by the manufacturers, the building would have been rendered incombustible. Eventually the Bench imposed a nominal fine of 20s. and costs in this case.
